TRADE NOTES.

We have had intimation of change of name of the patentees of the well-known "Eclipse" glazing, from "Primrose & Co." to "Mellowes & Darby," Sheffield and Hull, the partnership heretofore existing between Messrs. Primrose and Mellowes having been dissolved by mutual consent, Mr. Primrose retiring. No alteration takes place in the conduct of the business, Mr. Mellowes having been the acting partner for many years, and Mr. Darby, the Hull manager of the former firm, is now admitted to partnership.

During the octave of St. Peter, there has been erected in the church of St. Andrew, Monkton Wyld, Dorset, a complete set of exquisitely carved oak chancel stalls and prayer desks. They are very rich in elaborate and delicate carving, and have been erected at the sole expense of the rector, the Rev. J. B. M. Camm. Against the south pier of the chancel arch a brass, in the form of "An angel bearing a scroll," beautifully engraved, has been placed, with the following inscription :—"To the glory of God, and in loving memory of Anna Maria Camm, who fell asleep March 30, 1879, these stalls were dedicated by her son, John B. M. Camm, M.A., Rector of this Parish, June 29, 1886. 'Be thou faithful unto death, and I will give thee a crown of life.'" The whole of the work has been most excellently done by Messrs. Luscombe & Son, carvers and art workers, of Exeter, from the designs of Messrs. Hayward & Son. The Rev. J. B. M. Camm has now commissioned Messrs. Luscombe & Son to prepare an elaborately carved oak pulpit with marble pedestal to replace the present stone pulpit.

Messrs. Rottmann, Strome & Co., of St. Mary Axe, London, have just opened offices and show rooms at 46 Gordon Street, Glasgow. We are informed that this arrangement has been rendered necessary owing to the increased demand for Japanese leather paper in Scotland and the north.

We have received from Messrs. Bryant, Powis & Bryant, of Leadenhall House, E.C., eleven sheets of specifications of pine and other timbers which have just arrived from Quebec, and are now lying in various docks. We recommend those of our readers requiring timber to apply to Messrs. Bryant, Powis & Bryant at once for a copy of specifications, or a copy can be seen at the office of *The Architect and Contract Reporter*.

We understand that Messrs. Marshall & Co., Campbell Works, Stoke Newington, have just completed some fine windows for Victoria Park Congregational Church. The subjects treated are—"The Prodigal Son," "Christ Blessing Little Children," "The Good Shepherd," and "The Good Samaritan."

On Tuesday last a number of gentlemen, including some naval engineers, assembled at Messrs. Fraser & Fraser's steam-engine boiler works at Bromley-by-Bow, for the purpose of witnessing an exhibition of the "Marchant" engine, which the inventor, Mr. R. M. Marchant, claims, can effect a saving of no less than 80 per cent. of fuel, as compared with ordinary engines. The patent embodies the result of the return to the boiler, by means of a condenser, of the latent heat—that is, the steam which is usually wasted. The test proved satisfactory, and no doubt this invention will open up a new field to all interested in economy in the use of steam-power.

In connection with the festivities on the occasion of the recent royal marriage in Portugal, numerous nocturnal displays of illumination were made. The one which attracted most attention was the electric lighting of the Royal Palace of Ajuda, carried out by Messrs. Woodhouse & Rawson, electric light engineers, of London. On either side of the wide approach to the palace were fixed poles covered with crimson cloth, and with gilt spear-head tops, from which were suspended six powerful arc lamps, besides two suspended over the arcade at the entrance of the palace. The dynamo and engine were fixed in an outhouse behind the large quadrangle of the palace. Thanks to the elevated position which the palace enjoys, the lights were witnessed not only from the bar of the Tagus for several miles of its length, but also from the greater part of the city, and even from the village of Cacilhas and Barreirs, and the historic castle of Palmella far up the river. The lighting gave general satisfaction, and was very favourably spoken of by the Spanish press. The confusion which must inevitably have been caused by the thousands of carriages which conveyed visitors to the state dinners and balls would, but for the services of Messrs. Woodhouse & Rawson, have been indescribable. His Majesty the King graciously expressed his satisfaction at the perfect steadiness and general effect of the light.

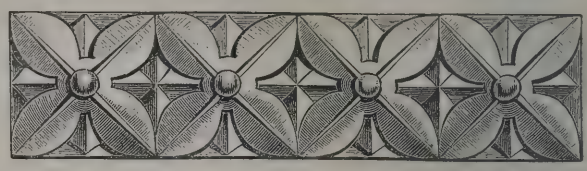
NOTES ON NOVELTIES.



WE subjoin a few illustrations of brickwork taken from the catalogue of Mr. Mark Gentry, of Hedingham and Wormwood Street, E.C., which will be seen to be of a good architectural character. These designs have been much appreciated and extensively used, and, judging by the large selection in the catalogues, it should not be a difficult matter to fix upon any

required design. Mr. Gentry lays claim to the possession of an excellent brick earth at his works at Hedingham, Essex, of natural colour, fineness and density. It is evidently one of the best veins of clay in the country, and extends over 35 acres. Provision is made for winter operations by drying sheds covering 1½ acres. The rubbers turned out from these works, being made of very fine earth, have a great weight and durability. They are made, too, of the natural earth, without washing or the addition of sand and colouring. These rubbers have gained a reputation and have secured a great demand. We have inspected Mr. Mark Gentry's store-rooms in Wormwood Street, which have an excellent variety of nearly everything that can be made out of clay, and are glad to call attention to

the rich colour and fineness of the bricks and their excellence of design. Mr. Gentry is enabled to supply customers from special orders in three weeks, and to follow any design submitted to him.

The Imperial Fire Extinguisher.—The "Imperial Fire Extinguisher" has been recently introduced into this country by Mr. T. H. Tilton, of Queen Victoria Street, E.C., after a successful "run" in the United States, and it starts its career under the great recommendation of having been practically tested and approved as a hand grenade reliable for extinguishing incipient fires. On Friday last a number of experts in the art of fire extinguishing assembled on a plot of waste ground on the Thames Embankment, in response to an invitation to witness "an Exhibition and Practical Test of the Imperial Hand Grenade Fire Extinguisher." A large attendance evinced the interest in the test. The object was to show how effectually the hand grenade in question could extinguish fire. For this purpose wooden buildings, including a section of a room, were erected, to represent the various forms of fire to which the "Imperial Fire Extinguisher" could be applied. The wood was made as inflammable as possible, being coated with pitch and well wetted with kerosene. Indeed, the managers of this "exhibition" left nothing wanting to make it an absolutely fair test

of the merits of the hand grenade in extinguishing a strong fire. While these preparations were being made, the visitors had the advantage of an explanation of the claims made for this special extinguisher, which they were soon able to confirm. Now everything was ready, and operations commenced. The first fire consisted of strong boards nailed together, of square shape, covered with pitch and kerosene. After being allowed to get "well hold," the grenade was thrown upon it from a distance of five or six yards. Two grenades sufficed to extinguish it, but as a stiff wind was blowing across the erection, the result was not so complete. This was conclusively proved in the succeeding tests, for in the remaining five or six erections—larger fires than the first—the grenade had the desired result. In one case a chimney of wood was allowed to burn until the flames came out at the top for 6 or 8 feet in height, but was similarly extinguished by the hand grenade. But the most decisive test was yet to come. The last erection would well represent the interior of a room. By means of pitch and kerosene it was made highly inflammable, a large quantity of shavings and wood being piled up inside, which was also saturated with kerosene. The immense volume of fire issuing from it seemed to be quite irresistible, and the general impression of the spectators seemed to be that it was rather too much to expect this grenade with its pound of chemicals to get it under. There seemed work enough for a fire-engine. Yet it was completely suppressed at the expense of only one grenade. Few who were present were prepared for such a sweeping test, and, needless to say, the exhibition was considered most satisfactory and conclusive as to the merits of the Imperial Hand Grenade Fire Extinguisher. After the effect of the grenade the fire at once died out in the most thorough fashion. The special advantages of this little extinguisher seem to be that instead of an ordinary thick glass—making its breakage difficult—the glass is thin, and the least effort breaks it. It is thin without the least liability of bursting through air acting on the chemicals. This difficulty has been got over by introducing a vent in the neck of the bottle, which thus prevents, by admitting and emitting air, the generation of gas in the bottle — the ordinary cause of explosions. It is evident that this is a great improvement over the thick bottle effecting the same purpose, but which it is very difficult for an unmuscular person to break in case of fire. The chemicals in the "Imperial" are claimed to maintain their power for any length of time. At a subsequent meeting at the Oriental Restaurant, Mr. T. H. Tilton presiding, Mr. Hill, chairman of the Fire Committee of the Metropolitan Board of Works, in seconding the toast of "Success to the Firm," proposed by Mr. Gilbert Wood, gave his testimony to the great value of hand-grenades in extinguishing incipient fires. He instanced their use at a recent fire at the Langham Hotel—extinguished before any alarm could be raised. He thought the "Imperial" was a perfect grenade, and, judging from the successful tests he had seen that day, was confident that it could extinguish an incipient fire of more than ordinary strength. The tests had taken place under the disadvantage of a stiff wind, but the success had been complete. Mr. T. H. Tilton, the enterprising manager of the "Imperial" in this country, in response to the congratulation of his visitors, expressed his pleasure at the large attendance to witness the tests, with which he was thoroughly satisfied. He alluded to the improvements introduced in the grenade, and anticipated a successful experience in this country on its merits.

THE BIRMINGHAM EXHIBITION.

THE Exhibition at Bingley Hall, which will be opened on August 26, promises to be a success. Many applications for space have been declined. Along the side of the walls there are to be erected, as designed by Mr. J. A. Cossins and executed by Mr. Bernasconi, old Birmingham shops, and near the north gallery the old "Crown Inn," Deritend, will be reproduced and used as a refreshment house. In the centre of the hall, which will be redecorated throughout, Messrs. Chance Brothers & Co. will erect a lighthouse. The building will be lighted with electricity by the Gulcher Company, of London—the main part with arc lamps, and the remainder with incandescent lamps. The various processes to be shown will be carried on upon the ground floor. The following local firms will be among the exhibitors :—

Engineering—Messrs. Tangye, Piggott & Co., J. Watt & Co., Belliss & Co., W. & J. Player, Patent Shaft & Axletree Co. (Limited). Tools—Mr. J. Chatwin. COLONIAL AND INDIAN EXHIBITION.

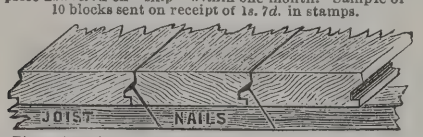
WE have been requested to give the following arrangements for the conferences up to the end of the present month. The following papers were announced:—July 12, Sir Robert Biddulph, G.C.M.G., "Cyprus," General Lord Wolseley, K.P., G.C.B., G.C.M.G., in the chair; July 14, Professor Leone Levi, F.S.S., "Wages of Labour in relation to Cost of Living;" July 15, G. Wall, "Capabilities of Ceylon," Right Hon. Sir W. H. Gregory, K.C.M.G., in the chair; July 16, Dr. Brandis, "The Forests of India," Lieutenant-General R. Strachey, C.S.I., F.R.S., in the chair; July 19, R. W. Murray, "Table Bay as a Harbour of Refuge," H. M. Stanley, F.R.G.S., in the chair; July 20, D. Morris, "Tropical Fruits" (illustrated with specimens and diagrams); July 27, Rev. W. G. Green, lecture, "The Alps of New Zealand" (with lime-light illustrations), 8.30 P.M.; July 28, Stephen Bourne, "Colonial Tariffs," 8.0 P.M.; July 30, F. W. Pennefather, "New Zealand, Historically and Socially," 4.0 P.M. Conferences will also be held by the Geologists' Association, the Anthropological Institute, the British Beekeepers' Association, and National Fish Culture Association.



TECHNICAL EDUCATION.

THE aim and purpose of the Crystal Palace directors in their department of technical education has always been to promote an union of the scientific with the artistic spirit in practical art. To quote an example:—The works of engineering, grand as some of them are as mere expressions of scientific strength, are mostly unnecessarily inartistic, and deficient in adornment; while works, the result of an unscientific pursuit of beauty and of artistic adornment, are apt to be deficient in scientific

MANUFACTURERS OF PATENT
METAL CASEMENTS
AND
LEADED WINDOWS.
Our Patent Steel "SIMPLEX" Casements have the following advantages over any other Casements in the market:—
They are thoroughly weathertight.
They can be made to open inwards or outwards, hung at the sides, or head, or sill, and in all cases the PLANE OF GLASS and the SIGHT LINE are the same.
They will not SAG, or TWIST, or JAM.
The Glass being secured by metal fillets the ragged appearance of putty is avoided.
The face being moulded has a more pleasing appearance than the ordinary uncouth finish.
By the use of these Casements all difficulties of window-cleaning are overcome.
The Patent "Cottage" Casement is made for such positions where plane of glass and thorough weathertightness are not absolute requisites, and where the extent of finish is not necessary.
Prices and particulars will be gladly furnished on receipt of inquiry.

strength. The study of beauty should be applied to dignify the work of the engineer—the study of scientific practice should be utilised to strengthen the position of the practical artist. An important development in this direction has just been made by the addition to the educational institutions of the Crystal Palace of a new division for the artistic and economic improvement of estates and landscape gardening. The directors have secured Mr. H. E. Milner, whose beautiful works are so well known and so famous, as principal. The delightful and lucrative profession that undertakes the improvement of land by artistic and scientific treatment, other than agricultural, can now be learnt by ladies as well as gentlemen at the Crystal Palace.

THE EMPLOYERS' LIABILITY ACT.

In the Queen's Bench Division on Friday the case of Pegram *v.* Dixon was heard. It was an appeal by the defendant from a judgment of the judge of the Marylebone County Court, awarding 50*l.* damages to the plaintiff in an action under the Employers' Liability Act. The defendant was a builder, and at the time of the accident which led to the present action was building a house at Finchley, where the plaintiff was working for him. During the building the workmen obtained access to the upper part of the house by ladders placed in the well intended for the staircase. There was another well throughout the height of the house intended for a lift, and this was used during the building for throwing rubbish down. While the staircase was being fixed the ladders used by the workpeople were transferred to this second well. The plaintiff was in the act of ascending one of these ladders when a boy on the third floor threw down a plank, which fell upon him, and caused the injuries complained of. No general notice had been given to the workpeople to desist from throwing things down the well when the ladders were placed there, but it was proved that the boy had been warned not to throw the planks down immediately before the accident. On these facts, His Honour, though doubting, held that there was a "defect in the condition of a way" within the meaning of those words in the Act, because no proper precautions had been taken to prevent people continuing to throw things down the well. There were other points in the case, but this was the only one raised in the present appeal. For the respondent it was contended that the well, being used with the defendant's approval as a means of access from one part of the house to another, came within the definition of a "way," and that the failure to take precautions to stop the practice of throwing things down, either by stationing someone to watch or otherwise giving notice, was a "defect" in the place, and clearly negligence on the part of the employer.

The Court allowed the appeal, and ordered judgment to be entered for the defendant, Mr. Justice Wills observing that it would be a preposterous abuse of language to hold that a mere negligent act of a fellow servant could be called a defect in the condition of a way.

R. ADAMS'S PATENT REVERSIBLE SASHES.

It will be seen from an announcement in this number of our journal that a company is about to be formed for the manufacture of Adams's well-known patent reversible sashes. We have no doubt that the company will be a great success, as it is within our knowledge that Mr. Adams has one contract, amongst many in hand at this moment, for the supply of fanlight-openers for not less than 2,600 sashes to the St. Saviour's Infirmary, Champion Hill, and we have no doubt that the architect and all parties concerned would have greatly preferred that the sashes should have been supplied by the same maker as the fittings.

BOYLE'S PATENT LATEST IMPROVED SHIP VENTILATORS.

Mr. Robert Boyle, of Robert Boyle & Son, Limited, Holborn Viaduct, has recently patented an improvement in his well-known downcast ventilator for ships which, in conjunction with the air-pump ventilator, has been so successfully introduced into the principal steamship lines in this country and the Continent.

The downcast ventilator, as shown in diagram fig. 1, can be adapted, so far as the height is concerned, to meet the requirements of naval architects and shipbuilders, which could not well be done with the old pattern, as a certain height in proportion to the diameter had always to be maintained with it. Extended experiment has demonstrated the new pattern to be a more powerful and reliable downcast, besides being absolutely watertight, it being found impossible to force water down the ventilator, though there is not a single valve employed, and

PAPER-STAINING WORKS
CHISWICK.

the air passes down freely and unobstructedly. The ventilator is a fixture, there being no movable part about it to get out of order, and it never requires trimming, acting with equal efficiency with the wind blowing from any quarter. It never requires to be removed or closed up during stormy weather, as is the case with the ordinary ship ventilator, so that the ventilation of a ship is never stopped or interfered with even though seas may be sweeping it from stem to stern. It has a

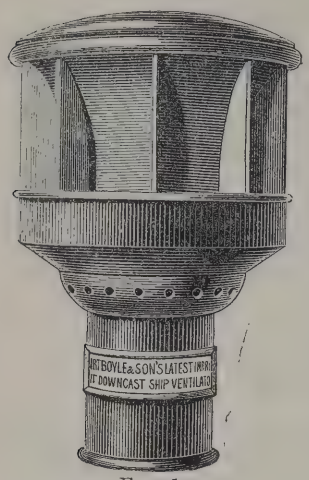

FIG. 1.

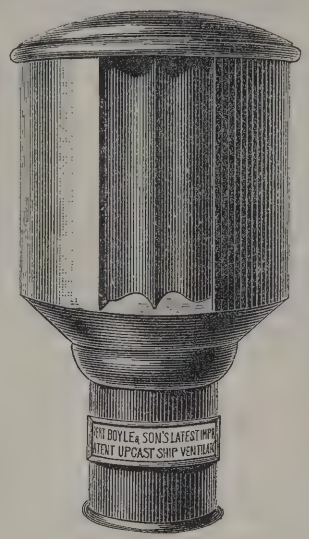

FIG. 2.

good appearance on board ship, and the price is such as is likely to induce shipowners, even during these bad times, to adopt it in preference to the old-fashioned and comparatively useless bell-mouth ventilator which is at present used in ships. Fig. 2 is a diagram of the latest improved air-pump upcast ventilator for ships which, besides creating a powerful and constant upward current, and being entirely free from down-draught, is perfectly watertight, so that it can always be kept in action. The two ventilators combined form a complete system of ventilation, with which the company are prepared to guarantee the ventilation of any ship which may be entrusted into their hands.

When such a competent naval expert as Sir Edward Reed, the naval engineer to the company, has the superintendence of the work, we think there should be little doubt of its success.

BUILDING BY-LAWS.

AT the last meeting of the Wellingborough Rural Sanitary Authority a letter was read from the Local Government Board relative to the by-laws proposed to be considered by the Guardians of the Wellingborough Union, acting as the Rural Sanitary Authority, with regard to new streets and buildings. The Board had considered the reasons adduced by the Rural Sanitary Authority for the omission from the by-laws of the various clauses comprised in the model by-laws relating to the structure of the roofs and chimneys, and the walls and foundations of new buildings, but having regard to the general importance of these clauses in securing the prevention of fires, the Board were unable to regard the reasons as satisfactory. The Board pointed out that in the absence of any such regulation, there would be nothing to prevent the construction of rooms of houses without any party walls above the levels of the ceilings of the uppermost storeys, the improper placing of timbers in party walls and near fireplaces and flues, and many other defects. As regards the objection of the Rural Sanitary Authority that the adoption of the completed series of by-laws would involve the appointment of a special surveyor, if such an appointment was found to be necessary and proper for the efficient execution of by-laws, the Rural Sanitary Authority should proceed to make such an appointment. After some discussion, it was proposed that the matter be referred back to the Rushden Parochial Committee, for that body to report to the next meeting of the Authority.

THE Comedy Theatre is doing good business under the auspices of Miss Violet Melnotte, who has revived "Erminie" in place of "The Lily of Leoville." The bright and merry opera is interpreted by the original cast and "goes," if possible, better than ever. Miss Florence St. John, who is in splendid voice, has, of course, the title rôle, the music of which she sings charmingly, while her acting is full of grace and vivacity. She is admirably supported by Messrs. Paulton, Wyatt, Mervin, Percy Compton, &c., and Misses Violet Melnotte, Minnie Bell, M. A. Victor, &c.

Price 21s. POST FREE. **HARNESS' ELECTROPATHIC (BATTERY) BELT.** Will last for years.

Over a quarter of a million Patients have been successfully treated for Rheumatism, Lumbago, Sciatica, Gout, Kidney Complaints, Epilepsy, Paralysis, Indigestion, Constipation, Female Complaints, General and Local Debility, Functional Disorders, &c. The following are selected from upwards of 25,000 reports received. The originals may be seen at the Company's Rooms, 52 OXFORD STREET, LONDON, W.

GOUT.
"Completely cured me."—*Major Pakenham, Armagh.*

HYSTERIA.

No. 87.—Autumn. Size 14 by 14. Price 4s. each.

No. 110.—Ecce Homo Size 11 by 11. 2/6 each.

No. 18. Size 10½ by 10½. Price 2s. each.

MANUFACTURED BY

McCAW, STEVENSON, & ORR,
BELFAST.

THIS is a series of transparent designs, from the simplest to the most elaborate and complex, enabling any person with a reasonable amount of taste and ingenuity to produce patterns on windows, having all the beauty of the real stained glass, at a very small cost. The advantages of this invention will be appreciated when it is considered that so many windows have a disagreeable outlook, which can now by means of the Patent Decoration, be shut out from view, and the beauty of the interior enhanced, while the labour of affixing the design is no more than a pleasant pastime and exercise of skill, in which ladies and children can take part. In cases where no disagreeable view exists, there may be portions of the house where there is an excess of light, and the covering of part of the glass with these designs will be found to be an improvement. Windows on stair-landings are particularly good subjects for treatment by the Glacier Decoration; while almost all windows, in whatever position, will be improved in appearance by having a portion of the glass at top or sides covered with suitable designs. Unlike many things invented for the purpose of window decoration, this cannot be rubbed off the window or defaced by cleaning.

A variety of Windows fitted with the latest Designs of Patent "Glacier" can be seen at PERRY & CO.'S Establishment, Holborn Viaduct, London.

"CURVED BORDERS,"
For Oval, Circular, and Spear-shaped Windows, &c.

No. 535 XX 5s. 6d. per dozen.

WITH THESE BORDERS WINDOWS WITH CURVED TOPS CAN BE FITTED WITH THE GREATEST EASE.

RELIGIOUS SUBJECTS.

PERRY & CO., LIMITED,
Steel Pen Makers, Sole Agents for Great Britain,
18, 19, & 20 HOLBORN VIADUCT, LONDON.

PERRY & CO.'S Viaduct Watch.
Price 21s. each.

Solid Silver Case, Keyless Action, Horizontal Movement, Jewelled.

SHIPPERS AND THE TRADE SUPPLIED.

SILVER KEYLESS Watch.
Price 21s. each.

White Enamelled Dial, Gold Hands, Sunk Seconds, Crystal Glass.

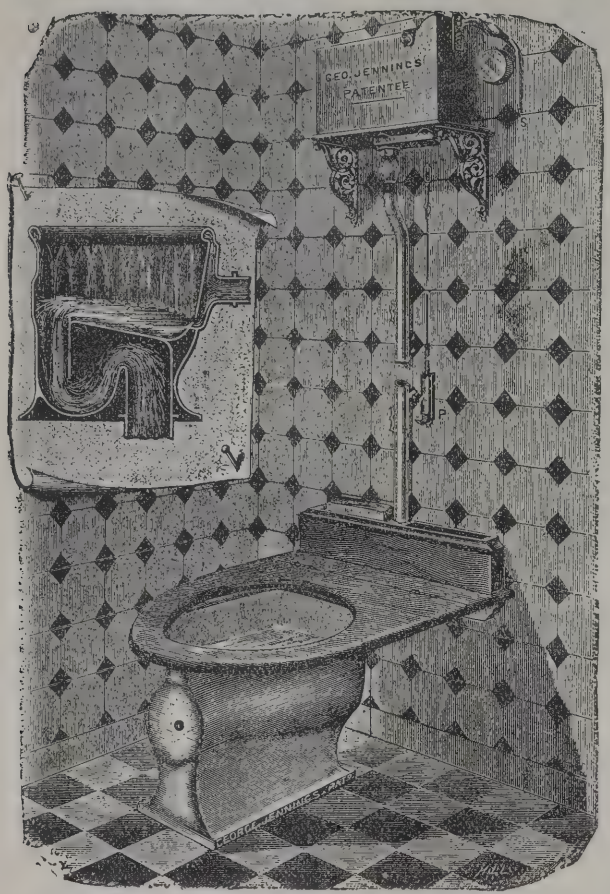
PERRY & CO.'S VIADUCT WATCH.
PRICE 10s. 6d. each.

This is the cheapest REAL Watch ever offered to the Public.

It has a Nickeled Horizontal Movement, quick-winding Keyless Action, setting hands from outside the Case, Jewelled in Four Holes, well finished throughout, Enamelled Dial, Sunk Seconds, in Stout Nickeled Cases.

Price 10/6 each.

Special terms for Watch Clubs.



Shippers and the Trade supplied.

Advantages of PERRY & CO.'S "VIADUCT" WATCH over the American Toy Watches which wind up like a clock: 1. Any watchmaker can repair it. 2. It does not require a machine to wind it. 3. The hands are set from the outside of the case, instead of being liable to be broken by turning them with the fingers. 4. It is Jewelled in Four Holes. 5. It has a hinged back, instead of being loose. 6. It has an Enamelled Dial, instead of a paper one.

PERRY & CO., LIMITED, HOLBORN VIADUCT, LONDON.

"THE PEDESTAL VASE,"
JENNINGS' IMPROVED W.C. APPARATUS

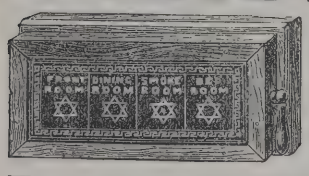
(Combination Urinal and Slop Sink).

Registered No. 16,300.

A PORCELAIN VASE set on a tiled or mosaic floor, within walls or a dado of glazed tiles. The usual wood framing, forming a storehouse for the retention and accumulation of *damp*, *dirt*, and *disease germs*, with the joints, crevices, and imperfections in work which the closet enclosure so often conceals, is entirely abolished. The seat is hinged, permitting free access for use as a *slop sink* or *urinal*, and for cleansing, so that the entire apparatus and space can be freely washed down. For this latter purpose the floor should be slightly sunk, and laid to fall to a grating, with waste carried through the external wall, and terminating in a copper flap valve to prevent draught.

☞ The suggestions as regards wall linings and floor, may, of course, be modified as best adapted to the building in which the closets are used; and in the consideration of such details, alternative schemes will readily present themselves.

At the recent **HEALTH EXHIBITION** (South Kensington, 1884), amongst a series of official tests, under the supervision of Baldwin Latham, Esq., C.E., and the Jury No. 9, Class XXIII., and successfully withstood by this closet, the following may be cited in evidence of its efficient action. Being fixed in position shown in illustration, with **"JENNINGS' PATENT SINGLE FLUSH WASTE-PREVENTING SYPHON CISTERN"** 5 feet over, with 1½ inch down pipe, ten apples (averaging 1¼ inch diameter) and a flat sponge about 4½ inch diameter were thrown into the basin. The water, as well as the whole of the exposed or dry surface, was first blackened with plumber's "smudge," and the sides covered by four pieces of thin sanitary paper, which adhered closely to the soiled surface. The handle of the cistern was then pulled, and the two-gallon flush liberated. After seven seconds (the time occupied by the discharge), a receiver placed under the trap outlet was removed, containing in the blackened water **the ten apples, the sponge, and the four pieces of paper,** no traces of the soil remaining visible upon any part of the apparatus.



GOLD MEDAL AWARDED.

THESE CLOSETS are already in use in Hospitals, Banks, Hotels, Offices, Private Residences, &c., with most satisfactory results, and, fixed in the manner described, in appearance and action leave nothing to be desired. By the novel arrangement of the supply to Basin, as shown in the sectional sketch annexed, the whole surface is well flushed and cleansed, whilst the bottom of Basin and Trap are thoroughly scoured by a concentrated rush of water which insures the **instantaneous removal** of the contents, thus overcoming the inherent defects in the many imitations recently produced of **"JENNINGS' MONKEY-CLOSET"** (the **original form of wash-out watercloset**), which was invented and patented by G. J. in 1852.

N.B.—Size and height of window no object.

TESTIMONIAL.

BANGOR, N. Wales: September 14, 1885.

Sirs,—I have pleasure in testifying that I have used Leggott's Silent Adjustments for various buildings to high skylights, fanlights, and top parts of windows, and in every case they gave satisfaction. They are secure in whatever position, whether the window is open or closed, and are quite simple and workable in their action. I prefer them to any other that I have seen or used for the above-mentioned purposes.—I remain, yours obediently, R. DAVIES, Architect.

Messrs. W. & R. LEGGOTT, Bradford.

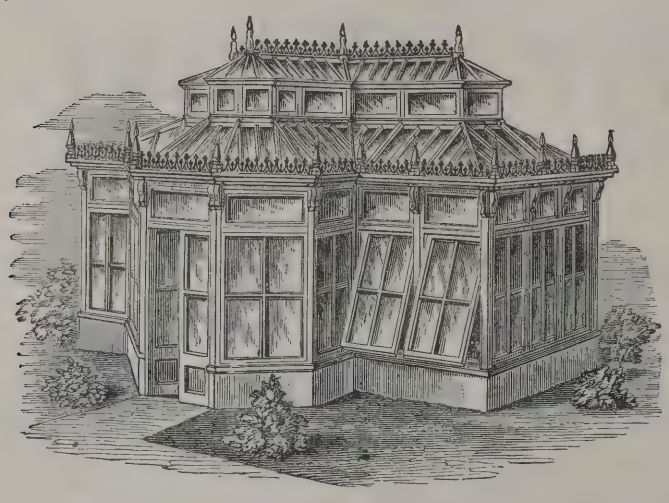
TRADE NOTES.

MESSRS. EDGAR KEELING, TEALE & CO., art-metal workers, of 14 Elm Street, Gray's Inn Road, London, W.C., have just supplied the locks and door furniture for the alterations being carried out, under the superintendence of Mr. Arthur Wells, architect, Hastings, at Sir Thomas Brassey's seat, Normanhurst, near Battle, Sussex.

WE understand that Messrs. Jameson & Co., of Dashwood House, Broad Street, are commencing the first of their periodical sales of timber by public auction on July 27 at the Baltic Sale Rooms.

THE directors of Raffety, Thornton & Co., Limited, announce an interim dividend at the rate of 7 per cent. per annum, payable on August 5 next.

THE American Elevator Company, of 38 Old Jewry, E.C., have been awarded the contract for a Standard hydraulic passenger elevator to be erected in the new offices of the New York Life Insurance Company in Berlin. The carrying out of this contract was at first prevented by an old municipal regulation prohibiting, on the ground of safety, the erection of any passenger-lift other than those of the direct-acting type. A full investigation, however, of the construction of the Standard elevator led the authorities to give the desired permission for erection.



MESSRS. COLLINSON & LOCK have fitted up a new entrance-hall at their establishment in the premises lately occupied by Messrs. Jackson & Graham. The outer vestibule is in grey Sicilian marble. The staircase, balustrade, and rail is in white enamel beautifully decorated with bas-reliefs in the style of Italian Renaissance. The dado of entrance-hall is panelled in same style, and the upper portion of the wall is in embossed leather solidly gilt. Messrs. Collinson & Lock have made a speciality of ornamental plaster-work, and some of their ceilings are the finest specimens of the kind we have seen. There are some fine specimens of carved chimneypieces, beautifully proportioned, well detailed, and executed with a perfection of workmanship that could not be surpassed.

AT the waterworks now in progress for the Corporation of Southampton, Messrs. Legrand & Sutcliffe have just completed the first artesian boring of 6 feet in diameter. We are informed that these are the largest borings in the world that have ever been made in one operation and without any pumping. During the sinking of the large shaft it was necessary to employ very powerful centrifugal pumps, as the superficial area of it is 949·875, and extensive concrete, brickwork, and masonry foundations were built by Messrs. Legrand & Sutcliffe, the greater portion of which are under water. The artesian borings will be lined for their whole depth with perforated steel tubes of 5 feet 11 inches diameter. As a contrast to this gigantic work, Messrs. Legrand & Sutcliffe have in progress one of $4\frac{3}{4}$ inches only, at East Horsley Towers, the country seat of the Earl of Lovelace, which has reached the depth of 785 feet, and is still in progress. This boring is one of special interest, as it commenced upon the base of the Thanet sand, and will penetrate and prove the whole thickness of the chalk stratum in the district. The thickness here of the chalk with flints is now known, and also that of the grey chalk. As soon as the upper greensand is touched, the thickness of the chalk marl will be demonstrated. As the leading geologists have determined by different colouring on the geological maps to show these three great divisions in the chalk, this boring possesses features of some importance, and cores are being carefully preserved for microscopical examination by experts.

TO travellers intending to visit the Continent for the Bank Holiday the Great Eastern offer very inexpensive tours *viâ* Harwich. A tour to the most picturesque parts of the Belgian Ardennes is offered at 35*s.*, *viâ* Antwerp and Brussels; and the old cities of the Zuyder Zee, the Rhine, and Switzerland can be reached at a very little increased cost. The company's new steamers, the *Ipswich* and *Adelaide*, will leave Parkeston Quay on the 31st inst., and return from Antwerp and Rotterdam early the next week.

MODEL DWELLINGS IN CLERKENWELL.

A SPECIAL meeting of the Clerkenwell Vestry was held lately to consider the refusal of the Metropolitan Board of Works to acquire the sites of the disused Coldbath Fields and Clerkenwell prisons, or either of them, for the purpose of erecting thereon blocks of artisans and labourers' dwellings, and like-

wise the desirableness of the vestry negotiating with the Home Secretary as to the terms upon which that body could purchase the eight acres covered by the former gaol, for this object or the provision of an open space for the public use and recreation upon at least a portion of the land. The vestry clerk read communications from the rate collectors of the vestry, which were to the effect that many blocks of industrial dwellings already built in the parish let very badly, and they served to deprive householders of lodgers who had enabled them to pay their rent and taxes. The secretary of the Industrial Dwellings Company wrote that 5 per cent. of that company's houses in Clerkenwell were empty, and that the supply of such abodes generally in the metropolis exceeded the demands. The City Commissioners of Sewers had not been enabled to fill more than half the dwellings recently erected by them, and even if full they would not pay more than one or two per cent. The secretary of the Metropolitan Association for the Improvement of the Dwellings of the Industrial Classes wrote that the average vacancies in the Farringdon Road block were from 15 to 18 in the last 12 months. On the other hand, the secretary of the Peabody Trustees wrote that the demand for rooms in the Clerkenwell Peabody buildings "is still very large, and the buildings are now fully occupied." It was decided to ask the Home Secretary at what price the land could be acquired for the purposes of artisans' dwellings and a recreation ground, for both or either.

LANDOWNERS AND BUILDERS.

In the Court of Appeal, before Lord Esher (Master of the Rolls), Lord Justice Bowen, and Lord Justice Fry, the case of Platt *v.* Parker has lately been heard. The case has arisen out of one of those agreements which are so common in the form of building leases, but in this instance took the form of a sale of the land for the purpose of building upon it by the purchaser. It was a case, as Lord Esher put it, of the owner of land in the neighbourhood of a populous town who desired to develop his property by building upon it, and with that view sold a quantity of the land to a builder, taking a covenant from him to build upon it, the owner making advances to him for the purpose, with a condition that if he did not complete the purchase by December 31, 1885, the owner should be at liberty to re-enter and retake possession. The purchaser did not complete at the time fixed, but the owner went on making advances, yet he afterwards re-entered and took possession of the unfinished houses, and also of all the plant and materials upon the premises. The other creditors of the builder disputed his right to take possession under these circumstances, contending that by going on to make advances the owner had waived the forfeiture. Hence an issue tried at Liverpool before Mr. Justice Denman, who decided it, however, in favour of the owner. This was an appeal from that decision. After a long argument the Court gave judgment for the appellant.

Lord Esher, in giving judgment, said it was clear enough what the case was. If it were for the benefit of the owner to do so, he would have re-entered and taken possession on the failure to complete at the time appointed, and then he would have been entitled to take the materials. But he had not done so, and had gone on making advances under the agreement; and (as doubtless he thought it would be for his benefit to do, with reference to his object to convert his land into building land) he had waived the forfeiture, and could not now go back to it, and as it was a breach by failure to complete at a particular day, which was past, it was not a "continuing" breach, so that a continuance of the default to pay did not constitute a fresh forfeiture. The issue, therefore, ought to have been decided against the owner, and judgment must be against him. Lord Justice Bowen and Lord Justice Fry concurred. Judgment accordingly.

THE BUILDERS' ACCIDENT INSURANCE, LIMITED.

The fifth annual general meeting of this Company was held at the registered offices on Wednesday, the 7th instant, Mr. Stanley G. Bird in the chair. The following report of the directors and statement of accounts for the year ending the 31st May, 1886, were presented to the meeting:—

"In presenting their fifth Annual Report the directors have great satisfaction in stating that the Company is in a sounder financial position than it has ever been in, in spite of the large number of accidents which they have had to deal with and the continued depression in trade. The directors have in the course of the year had under consideration no less than three hundred and fifty-six accidents, and they have thought it right to contest liability in ten cases, in seven of which they have been successful. In the case of one accident, involving injuries to five workmen, the Company were unsuccessful, and the amounts payable in this case, in addition to the consequent costs, con-

PRESS OPINIONS.

Messrs. Sanderson & Sons have been awarded for their Wall Decorations the only Gold Medal at the New Orleans International Exhibition. This Medal may be considered the highest ever awarded to a paper stainer, as it was not obtained, as usual, in competition with other English firms only, but with the whole world—English, French, German, and American firms being all in one class.

stitute 1,180*l.* of the total of 3,281*l.* paid during the year. The sum reserved in last year's accounts has not been affected by the claims, and the Company have at the present time a larger amount in hand than last year, with an estimated liability considerably less. The directors regret that there has not been that increase in the business which the northern committee expected would accrue from extending the Company's policy to cover sub-contractors' workmen without any increased premium; but notwithstanding this, and although there has been a falling off in the ordinary premiums, it has been more than counterbalanced by the additional premiums received for the risk to the public. The accounts show that after reserving 2,023*l.* for unsettled claims and unexpired risks, there remains a sum of 1,200*l.* for future bonus to be paid to members of the past year on renewal of their insurance, and to meet other known liabilities. It has been considered advisable to discontinue the working of the Bristol District Agency as a separate branch. During the past session of Parliament two Bills to amend the Employers' Liability Act, introduced into the House of Commons, were referred to a select committee. The chairman gave evidence before that committee, and they have now made a report to the House which recommends that 'with certain amendments the Act should be renewed and made permanent.' Should any legislation embodying its terms be introduced into Parliament it will have the careful attention of your board. The following six directors retire from the board in accordance with the Articles of Association:—Messrs. Thomas Barnsley, J. T. Chappell, J. Howard Colls, Robert Dennett, James Greenwood, and J. H. Marsden, all of whom are eligible and offer themselves for re-election."

The Chairman said:—In presenting the report of the directors for the past year, I may say that we do so with mingled feelings of regret and satisfaction; of regret that the business has not increased to the extent we were led to hope might result from the issue of the new form of policy, covering the risks for personal injuries caused to or by the workmen in the service of the insured, by or to sub-contractors' workmen engaged with them as defined in the Company's policies, and we also hoped that as the Company became better known our business would have increased, but the general depression has had such a disastrous effect upon the building trade that it has been reflected upon this Company. When I tell you that over 10 per cent. of the premium received has been returned for unexpended wages, it is a sure criterion of the great depression in trade. As every care is taken by the secretary in obtaining these returns, you may be quite satisfied that the insurers are fully justified in asking for this *bonâ fide* rebate off the amounts that have been paid for premium during the past year; still, I think we ought to be thoroughly satisfied that we have been able to hold our own, and have a balance in hand notwithstanding these bad times, and the exceptionally large amounts that the Company has had to pay for compensation and law costs. Due allowance has been made for any claims that may be made upon us either in the way of debts or liabilities. At present we only insure our own trade and those trades connected with building, and do not go into other trades where probably there might not be so many risks and which would therefore be more profitable. The building trade is usually looked upon as a risky one; we know when we insure our own lives that we all have to pay extra premium, therefore I think when we show that this Company can insure its members at equally low rates to those charged by other companies we may congratulate ourselves. As you will notice in the report we propose to pay a bonus of 10 per cent.; if you agree to pass a resolution to that effect it will bring the rate of premium that we charge on renewal to about the minimum rate charged by other companies. Considering the mutual character of this Company and the short time it has been in existence, and the great cost of working a new company, I think we may consider this a source of satisfaction. You will see by the report that during the past session two Bills were introduced into parliament for amending the Employers' Liability Act, and at the request of the Board of this Company and the Councils of the Institute of Builders and the National Association, Mr. W. H. Cowlin and myself gave evidence before the Select Committee of the House of Commons. Certain provisions we did not oppose, in fact some of them we did not think at all objectionable. We, however, opposed the Bills, but I think the result will be that the Act will be made permanent with certain amendments, and it is quite clear from the tone of the report that has been made that those amendments will not be in favour of the builder. I think therefore you should take the matter into consideration, and the chances being that the risks run will be very much intensified, it behoves all members to support their own Company by bringing to the notice of their brother builders the great risks they run, and advise them to insure with this Company, especially pointing out that it is a strictly mutual Company, and that any profit will be returned to insurers. I beg to move that the report and balance sheet as audited and presented to the meeting be

MANUFACTURERS OF PATENT
METAL CASEMENTS
AND
LEADED WINDOWS.
Our Patent Steel "SIMPLEX" Casements have the following advantages over any other Casements in the market:—
They are thoroughly weathertight.
They can be made to open inwards or outwards, hung at the sides, or head, or sill, and in all cases the PLANE OF GLASS and the SIGHT LINE are the same.
They will not SAG, or TWIST, or JAM.
The Glass being secured by metal fillets the ragged appearance of putty is avoided.
The face being moulded has a more pleasing appearance than the ordinary uncouth finish.
By the use of these Casements all difficulties of window-cleaning are overcome.
The Patent "Cottage" Casement is made for such positions where plane of glass and thorough weathertightness are not absolute requisites, and where the extent of finish is not necessary.
Prices and particulars will be gladly furnished on receipt of inquiry.

adopted. This having been seconded by Mr. F. J. Dove, the motion was carried unanimously.

Moved by Mr. H. H. Bartlett, seconded by Mr. Thomas Patrick, and resolved :—"That a bonus of 10 per cent. upon last year's premiums be paid in the form of rebate to such members as renew their insurances, and that in cases where insurances have already been renewed since May 31, 1886, the bonus be forthwith paid."

Moved by Mr. H. Densham, seconded by Mr. J. Franks, and resolved :—"That the sum of five hundred pounds be apportioned for the remuneration of directors for their services during the past year."

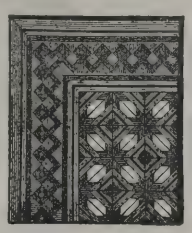
Moved by Mr. Thomas Patrick, seconded by Mr. J. S. Jones, and resolved :—"That the following six directors, who retire from the board under the Articles of Association and have signified their willingness to stand, be and they are hereby re-elected, viz. Mr. Thomas Barnsley, Mr. J. F. Chappell, Mr. J. Howard Colls, Mr. Robert Dennett, Mr. James Greenwood, and Mr. J. H. Marsden."

Moved by Mr. Thomas Patrick, seconded by Mr. Southern, and resolved :—"That Mr. Charles Fox be and is hereby re-appointed auditor."

Moved by Mr. F. J. Dove, seconded by Mr. Thomas Patrick, and resolved :—"That the thanks of the meeting be tendered to the chairman for his able services during the past year and in presiding over this meeting."

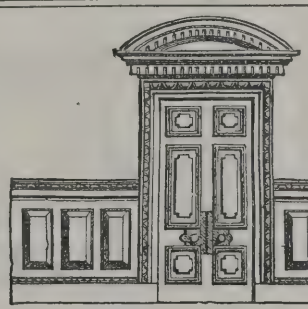
MONKS' PARK STONE.

THE case of Sumsion *v.* Pictor & Sons has been again before the Chancery Division upon an application by the plaintiff for an order to discontinue the action. The plaintiff in the action, Mr. Isaac Sumsion, carries on business at Bath as a stone merchant, and the defendants are Messrs. Pictor & Sons, Bath stone merchants, Box, Wilts. The question in dispute in the action had reference to the use of the words "Monks' Park" as a description of the Bath stone raised from the quarries of the respective parties on the Monks' Park estate, Corsham, belonging to Sir Gabriel Goldney, Bart., M.P. The plaintiff claimed in the action that he had the only quarry in Monks' Park, Corsham ; that he alone was able to supply the genuine Monks' Park stone ; that Monks' Park stone had acquired a high reputation, and was a mineral specially adapted for weight-bearing purposes and for resisting carbonic acid gas and atmospheric influences, and was in great demand for large buildings ; that he had registered a trade-mark, of which the words "Monks' Park" formed a prominent part ; that he had first adopted the words "Monks' Park" as applied to his stone ; and that the defendants had no quarry at Monks' Park ; and that they had been selling stone as Monks' Park which was in fact not Monks' Park stone ; and he claimed the exclusive right to the words "Monks' Park" as applied to Bath stone. The defendants contended they had a right to use the words "Monks' Park" ; that they had ninety-six acres of the minerals of the Monks' Park estate, whilst the plaintiff had only thirty acres ; that the plaintiff had no exclusive right to work the mineral at Monks' Park, or to use those words ; that their minerals were within 300 yards of the plaintiff's ; that they were working the same deposit of stone, and that it was in every way equal in quality to the plaintiff's. They also said they had not infringed the plaintiff's trade-mark, and that they had been selling their stone for two years under the name of Pictor's Monks' Park, with the knowledge of the plaintiff.



The plaintiff originally moved to restrain the defendants from selling or offering for sale any stone under the name "Monks' Park" or "Monks' Park Stone," other than stone obtained from the plaintiff's quarry, and to restrain them from using the words "Monks' Park" as the name or description of any of the defendants' stone, and also that the defendants might be restrained from infringing the plaintiff's registered trade-mark.

The motion was argued at considerable length, and was before Vice-Chancellor Bacon for several days, Mr. Horton Smith, Q.C., and Mr. Bradford (instructed by Messrs. Moges) then appearing for the plaintiff, and Mr. Millar, Q.C., and Mr. E. W. Byrne (instructed by Mr. B. A. Dyer) for the defendants.



Vice-Chancellor Bacon, in giving judgment, said the plaintiff's case utterly failed. The evidence of Sir Gabriel Goldney and others showed that the name of the whole estate in which both parties had quarries was Monks' Park. The defendants had as much right to use that name as the plaintiff. They were working the same deposit of stone, held of the same landlord under the same title. It was proved that the bed of stone under the Monks' Park Estate, which the plaintiff quarried as well as defendants, was of the same kind and quality, being of the same bed. A most grave and serious charge had been made against them of palming off stone as Monks' Park stone when it was not so. That charge was unsupported by any evidence, and was entirely disproved. The evidence showed

TURPIN'S PARQUET FLOOR, JOINERY & WOOD CARVING CO., LD., 22 QUEEN'S ROAD, BAYSWATER, LONDON, W.

PARQUET FLOORINGS.

that the defendants had been selling and advertising largely their stone as Monks' Park, and the plaintiff knew it. He (the Judge) refused the motion. He could not give costs at that stage, as it was an interlocutory motion, but when the costs had to be dealt with, there would be no difficulty in deciding who should pay them.

The plaintiff afterwards continued proceedings, and applied for a further affidavit of discovery by the defendants, but the application was refused by the Vice-Chancellor. The plaintiff thereupon appealed, and the matter was argued before Lords Justices Cotton and Lindley, who dismissed the appeal with costs. Upon the present application an order was made that the action be discontinued, the plaintiff not to bring another action against the defendants in respect of the same subject matter, or relief sought, and it was also ordered that the plaintiff should pay to the defendants their costs of the action.

ORNAMENTAL BRICKWORK.

MOST conclusive evidence of the large increase in the use of brick and terra-cotta enrichments, and of the great development of architectural design for this material, will be found in turning over the plates of "Brick Ornament and its Application" (Parts 1, 2, 3, and 4), which we have received from Mr. James Brown, brick merchant, of 103 Cannon Street, E.C. This work will be all the more valued from the co-operation of architects, whose assistance by way of suggestions, and also of drawings by Mr. G. Sherrin, architect, Mr. James Brown acknowledges in his preface. The four parts altogether comprise little short of one hundred plates. Among these are a few drawings of ancient brickwork, which not only show the perfection attainable in this material, but are handy, enabling one to judge of the various effects of detail when combined in a whole. Design, however good, is wasted without the material that is to receive it is also good, and we need not say a word as to the excellence of Mr. Brown's brickwork. Those who visited the late Building Exhibition will remember the porch for the church at Catford put up by Messrs. Randell, Saunders & Co. The admirable brickwork in the porch was the work of Mr. James Brown, and the effect produced by it was, it will be remembered, particularly pleasing. Mr. Brown in these plates gives us illustrations of moulded bricks—strings, panel borders, jamb bricks, architraves, chimney bricks, and copings; ornamental bricks—bands and strings, including cornice bricks, panel borders, architraves, friezes, and flat bands; pateræ and squares, diapers; shield panels, Gothic panels, and other panels of all varieties; swags, pilaster enrichments, arch bricks, key bricks, chimney divisionals, chimney-pots, balusters, air-bricks, spandrils of special designs, flower vases, &c. The sections given have the advantage of being full size. Mr. Brown must be congratulated for the wonderful amount and variety of really excellent designs, and for illustrating the application along with the materials, which gives as truthful a guide as can be arranged on paper to assist the judgment of those who consult its pages. The old work illustrated is from Layer Marney Tower, an old house at Enfield, and great Baddon Church, reproductions of excellent measured drawings of the greatest merit.

MURAL HANGINGS.

MESSRS. FISHER & CO., of 33 Southampton Street, Strand, W.C., have just arranged a sample pattern-book of artistic, sanitary, and washable wall-hangings. About fifty patterns are included, and these are not intended as a catalogue from which to select wall-hangings, but to show the style of manufacture. In other words, the whole of the colours and designs in stock are not to be considered limited to the samples before us, as they are far too numerous to come within so small a compass. In addition, it frequently happens now that clients require their own ideas in regard of colour and design carried out, which Messrs. Fisher & Co. are often called on to do, and have not failed to give satisfaction. The duro-textile is manufactured to any design or colour—the samples, indeed, are a pleasing example of what may be expected from Messrs. Fisher & Co.—as a washable, damp-proof, sanitary, indesctructible wall covering, which admits of being freely scrubbed with soap and water. More elaborate enrichments will be got by the use of another hanging, the patent embossed tapestry. A special feature of this last is that the raised or embossed figure is filled in the back with waterproof cement, rendering it indestructible. The muraline is a high-class wall covering finished in oils. It is non-absorbent, printed with non-poisonous materials, and freely washable. The jurors at the Inventions Exhibition showed their approbation by conferring a prize on these specialities. An inspection of these samples show the very beautiful wall coverings that are turned out by Messrs. Fisher & Co., and which would do credit to any firm, and, besides, are a marvel of cheapness.

BRYANT, POWIS & BRYANT LIMITED,

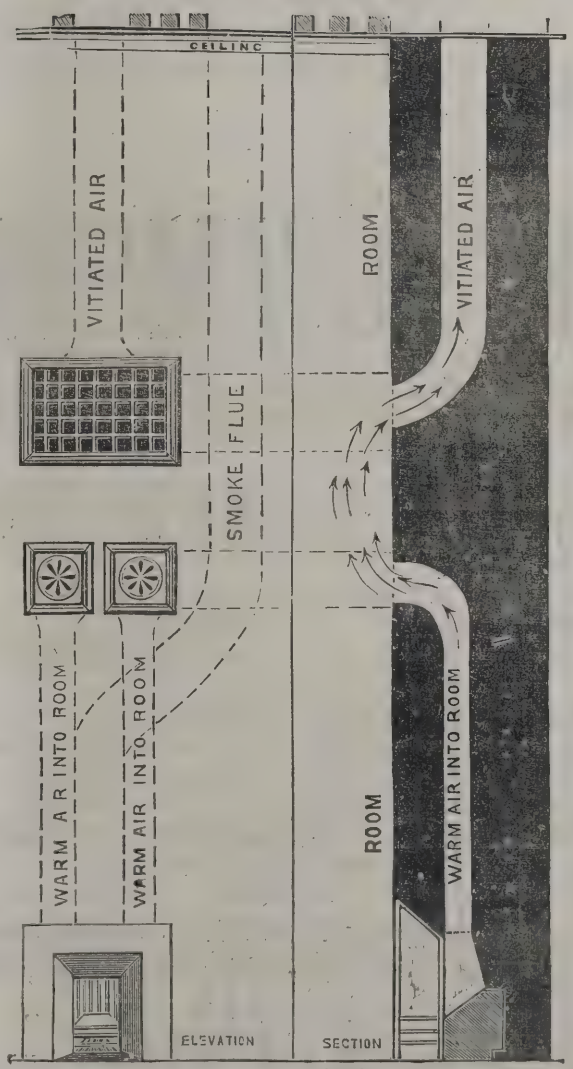
WARMING! COOLING! VENTILATING!

WHEN rooms containing from 2,000 up to 40,000 cubic feet of space, or two or three rooms, say bedrooms, in addition to that in which the fire is situate, are thoroughly warmed and ventilated by one of SHORLAND'S PATENT MANCHESTER OPEN FIRE-GRATES, which are made in every design, what more is there to be reasonably desired in connection with the Warming and Ventilating of our Schools, Colleges, and Dwellings? And to convince the most prejudiced and uninitiated that this (to them, impossible feat) is not only possible, but an accomplished fact, Illustrated Prospectus, with Testimonials confirming this statement, will be sent to anyone interested, on application to the Patentee, G. L. SHORLAND, Imperial Buildings, Ludgate Circus, E.C., or to Mr. E. H. SHORLAND, SANITARY, WARMING, AND VENTILATING ENGINEER, ST. GABRIEL'S WORKS, MANCHESTER.

ESTIMATES FOR WARMING AND VENTILATING EVERY DESCRIPTION OF BUILDINGS, AND SUCCESS GUARANTEED.

TO ARCHITECTS.



GENTLEMEN,—An erroneous impression is current that the Patent Manchester Warm-Air Generating Grate Backs, or, as they are more generally styled,

MANCHESTER GRATES,

are only suitable for School purposes, which is misleading; the fact is that the Patented Arrangement, being hermetically sealed and complete in itself, is applicable to every design of Front Grate; and being made in every size to suit Grate Fronts with from 15-inch to 25-inch Fire-bars, you have only to give, when ordering, the width of Fire-bars for which you require the

PATENT MANCHESTER FIRE GRATE BACK.

The whole of the Patent Backs are supplied with Fire-boxes lined with Fire-clay Blocks, which cause a bright Fire, and at the same time prevent the Warm Air Generated becoming burnt. These Fire-clay Blocks are easily accessible when Grates are in use, and readily replaced.

As at Leeds and some other places, which is not Shorland's System.

P.S.—(Extract.)—"I have found the **MANCHESTER GRATES** during the past ten years a great comfort in maintaining an equable and warm temperature throughout my House during the Winters. . . . The four Manchester Grates fixed on the Ground-floor Rooms Warming and Ventilating Eight Rooms and the Entrance Hall."

"The three Patent **MANCHESTER GRATES** you fixed to my order at the Croydon Workhouse, to Warm and Ventilate Seven Rooms, answer the purpose admirably, Warming them in Winter and Cooling them in Summer.—Yours truly, JOHN BERNEY, Architect, Croydon."

Another gentleman writes:—"I am so satisfied with the **MANCHESTER GRATE** that I send you an order for **Seventy more.**"

Book of Testimonials on application, from all parts of the United Kingdom, and Model sent, carriage paid.

G. L. SHORLAND, Patentee and Sole London Agent, IMPERIAL BUILDINGS, LUDGATE CIRCUS, E.C.; or to Mr. E. H. SHORLAND, St. Gabriel's Warming and Ventilating Works, MANCHESTER.

BRADSHAW'S LIMMER ASPHALTE

Messrs. BRADSHAW & CO., being Sole Agents in the United Kingdom for, and possessing proprietary rights in, the Freehold Mines of the German Asphalte Company (of which Mr. C. W. Bradshaw is also a Director), situated at Limmer, near Hanover, and Vorwohle, Brunswick, possess special facilities for reliable and prompt delivery of their celebrated "LIMMER ASPHALTE" at low rates, either for sale in its natural state or ready for laying by their own workmen in any part of the United Kingdom. EACH BLOCK supplied from these Mines, besides bearing the impress of the Company, is stamped with the words "BRADSHAW & CO." The attention of Architects, Engineers, &c., is particularly called to the fact that the "LIMMER ASPHALTE" is especially suitable for use in the construction of Reservoirs, Roofs, &c., where water-tightness is extremely essential. For such purposes **Over 2,000,000 (Two Millions) of Square Feet of "Limmer Asphalte"** have been executed by Messrs. BRADSHAW & CO.; while for Paving purposes **Over 50 Miles of "Limmer Asphalte" Footways** have been laid by them in the LONDON DISTRICT ALONE. Messrs. BRADSHAW & CO. will be happy to forward Prices, Samples, and Testimonials, and give all information on application to:—

OBSTRUCTION IN THE STRAND.

MR. J. W. PALMER, of 281 Strand, writes us as follows:—"A scene in the narrow part of the Strand is nothing unusual, for a 'horse down' will collect a mob in the best-regulated thoroughfare, and here accidents continually block the way. Still I think a protest ought to be raised against such a scene as I have just witnessed—a crowd of newspaper boys and men having gathered outside a printing-office which is just publishing a version of a recent sensational trial. A posse of police is now stationed in front of the door, and the road is to all intents and purposes blocked by the poor and offensive creatures who wish to invest their pence in this kind of stock, which is now being sold broadcast in the streets, where the traffic, however, is not affected as it is here, whatever the public morality may be." We can add our testimony to Mr. Palmer's complaint. On Monday and Tuesday last the part of the Strand to which our correspondent refers was almost completely blocked by a large number of street-pamphlet sellers, and it required the efforts of not less than nine policemen to keep the road clear. There is no probability of improvement until this part of the Strand is widened.

CONTRACTS OPEN.

ABERGAVENNY.—Aug. 3.—For Building Shop and House. Mr. Edwin Foster, Architect, Woodstock House, near Abergavenny.

ASHTON-UNDER-LYNE.—For Building 21 Houses, also 32 Houses. Messrs. J. D. & J. Lindley, Architects, Henry Square, Ashton-under-Lyne.

BATH.—Aug. 3.—For Conversion of Auckland House into Poor Law Offices. Mr. C. E. Davis, F.S.A., Architect, 55 Great Pulteney Street, Bath.

R. ADAMS,

17 BLACKMAN STREET & 7 GREAT DOVER STREET, LONDON, S.E.,

INVENTOR and PATENTEE of the

SAFETY WINDOW WITH REVERSIBLE SASHES

FOR INEXPENSIVE AND PERPETUAL CLEANLINESS,

Which has gained at the INTERNATIONAL HEALTH and SANITARY EXHIBITIONS

Two Gold, Four Silver, and Four Bronze Medals, and Sixteen Diplomas of Merit.

IMPORTANT NOTICE.

The Patentee has been advised by several of his friends to form a Company for the Manufacture of the above-mentioned Sashes in larger numbers, for the supply of the Trade and for the Home, Colonial, and Foreign Markets. Hitherto he has only supplied the Fittings, except under very special circumstances. He now proposes to manufacture the Sashes complete with Fittings.

Provisional Protection has just been granted for another Patent, whereby the Sashes will be greatly reduced in price, and, consequently, brought within the requirements of every Architect and Builder.

If any of the readers of this journal wish to receive further particulars or to take Shares in the proposed Company, they are requested to make early application to the Patentee, as it is expected that the larger number of the Shares will be privately subscribed.

Applications for Shares will be taken in the order in which they are received.

HEALEY.

For the Erection of a House at Healey, Batley, for Mr. John Oldroyd, Blanket Manufacturer, Healey. Mr. J. T. LAW, Architect, No. 64 Commercial Street, Batley.

Red or Fire Clay. Also the preparation of a Rich Blood Red Slip, which serves as a Coating for Red Bricks of inferior colour.—Address "BRICKS," "The Architect," London.

GRUNDY'S PATENT
WARM-AIR
VENTILATING FIRE GRATE.
The novelty, superiority, and advantage of this patent consist in the heating surface being greater than any other Fire-grate introduced to the public. It is very simple in construction, and is made in the form of a Stove, the back of which is semicircular in shape, with gills behind and smoke-nozzle on top, all cast in one piece. The same can be attached to any design of a Register or Stove front. It is very suitable for schools, class-rooms, waiting-rooms, hospitals, offices, dormitories, and dwelling-houses, from the cottage to the mansion. Design and specification post free on application.
TESTIMONIALS.
"9 Victoria Chambers, Westminster, S.W.: June 10, 1884.
"SIR,—I have much pleasure in testifying to the efficiency of your patent warm-air fire grate. It has been very successful, and given every satisfaction where I have used it. Yours, &c.,
JAMES WEIR, F.R.I.B.A."
"To Mr. Grundy.
"6 John Street, Bedford Row, W.C.:
"December 16, 1885.
"DEAR SIR,—I have now had an opportunity of testing your patent grate, and am glad to be able to say that I am most agreeably disappointed, because, as you are aware, I was rather sceptical about its powers when you showed it to me; but now I can say it answers admirably, and heats abundantly my porch-conservatory.—I am, yours truly,
"R. S. LANDER, F.R.I.B.A."
"To Mr. John Grundy."
From James Garry, Esq., Architect, West Hartlepool, July 1884.
'DEAR SIR,—I have very great pleasure in stating that the first stove, or patent warm-air ventilating fire grate, adopted by me in school at Seaton, and a second in a Cocoa Palace, have given such satisfaction that I now order eleven to be inserted in New Upper Grade Schools in course of erection at West Hartlepool. They are the most economical, efficient, and easily managed stove at present before the public.—Mr. John Grundy."
From Hon. and Rev. G. G. C. Talbot, M.A., Withington, Cheltenham.
"DEAR SIR,—You will be gratified to hear that the school is completely warmed by your new grate. It is the most economical and efficient that I have ever seen.—Mr. John Grundy."
Society of Architects, Architectural and Building Trades Exhibition, 1885:—"5 Great James Street, Bedford Row, May 1.—The warm-air ventilating grate shown by Mr. John Grundy at Stand 75 Floral Hall, is an admirable contrivance for utilising the heat conducted through the back and sides of the stove, for warming schools and buildings by a supply of freshly warmed external air."
Apply to JOHN GRUNDY, 30 Duncan Terrace, City Road, London.—Works: TYLDESLEY, near Manchester.
Agent for Scotland, SEPTIMUS HARPUR SMITH, 1 Upper Gilmore Place, Edinburgh.

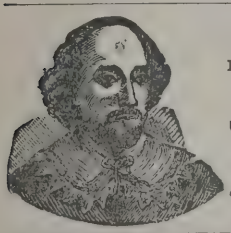
H. LOOKER, Stratton (*accepted*)	£145	0	0

TRADE NOTES.

MESSRS. STEELE & WOOD, having purchased the stock-in-trade of the Crystal Porcelain Pottery Company, have secured by public tender the entire business, and are making arrangements for prompt re-starting the works at Cobridge.

AT the meeting of the Carlisle Town Council, on Tuesday, it was stated that some of the wards of the House of Recovery were in such an unsanitary condition that it had been proposed to strip the plaster from the walls and recoat them with Robinson's cement, from the Knothill Plaster Works, near Carlisle.

MR. JOHN RAWLINGS, of Hackney Road, is now exhibiting two spiral cutter planers complete and in motion. He claims for the machine that the most curly and cross wood will require no hand-planing or scraping after once having been put through the cutter, and that from eight to ten thousand feet, including grinding, can be planed in a day of ten hours. No doubt this plane will be taken up by the trade when it becomes known to them.



MESSRS. BARRON & SON, of Nottingham, have been appointed as consultant engineers and surveyors to the Wednesbury Urban Sanitary Authority, to prepare plans and specifications for the laying out of the proposed park, with liberty to tender for carrying out the work, the commission to be merged in the contract if theirs be accepted.

THE Plumbers' Company are showing great energy in their endeavours to secure the registration of competent plumbers. It will be seen that already many members of the trade have appeared before the Company at the Guildhall, and duly received certificates. Both masters and men belonging to London and the country were represented. The efforts made by the Company are deserving of support by the trade and of approval by the public. The experiment will be watched with much interest.

THE improvement of the river Ribble is being rapidly proceeded with, under a scheme of Sir John Coode, slightly modified. There are now 1,200 men and five steam navvies employed on the work daily, under the superintendence of Mr. Walker, contractor, of Westminster. About 2,400,000 cubic yards of earth have been removed from the river diversion and the site of the dock, which will have an area of 40 acres. This is about half the work of excavation, which was commenced in September last. It is expected the diversion cut will be completed in about twelve months. Nearly 37,000 yards of concrete has been laid down for the dock. The thickness of the walls at the base is 17 feet 6 inches, and the height 40 feet.

Designs and estimates on application.

About 700 feet of the wall has been completed, with the exception of the coping, and the foundations of the dock gates are now being put in. The lock excavations are finished. Blasting and digging in the dock basin is going on with great rapidity.

THE directors of Perry & Co., of London and Birmingham, have resolved to pay on September 1, out of profits, an interim dividend on the ordinary shares for the first six months of the year, at the rate of six per cent. per annum, free of income-tax, being at the same rate as for the corresponding period last year. The half-yearly dividend on the preference shares will be paid as usual at the fixed rate of five per cent. per annum.

JAMES WATT WET DOCK, GREENOCK.

THE James Watt Wet Dock of Greenock has been completed, and will be formally opened for traffic on August 5. The cutting of the first sod dates back eight years ago. A great deal of time during the eight years has necessarily been occupied in making the extensive excavations necessary for so great an undertaking. Of 1,150,000 cubic yards of soil removed in the excavations, 320,000 cubic yards were in rock which had to be blasted, and the rest principally stony clay. In addition to this work some time was taken up in distributing the rock and soil so removed to form three tidal harbours around the dock. The last year has been taken up with cutting out the entrances to the dock, the building of sheds and warehouses, and fitting the dock with all equipments necessary.

The James Watt Wet Dock is the second completed of the several extensive undertakings in the way of the enlargement of the harbour accommodation of the port which the Harbour Trustees of Greenock entered upon some eighteen years ago on the Garvel Park estate. The dock is 2,000 feet in length, and 300 feet in breadth for about half of its length, the other half being increased to 350 feet, where a jetty 800 feet long and 50 feet broad, to be used exclusively in the shipment of coals, is constructed running down the centre of the dock from the eastern end. The water area of the dock is about 14½ acres, and the length of the quay round it is 7,000 feet, or about 1¼ miles. It has two entrances—one from the western tidal harbour and the other from the northern or Great Harbour. Each of the entrances is about 75 feet in width, with 32 feet of water on the sill at high-water ordinary spring tides. By means of Mr. Kinniple's (engineer to the Greenock Harbour Trust) patent caissons the water is retained in the dock at a uniform depth of 32 feet. Each of the caissons is run upon rollers fixed to the floor of a recess in the wall of the dock, and by means of a small hydraulic engine is carried in and out as the necessity for opening or closing of the dock may require. This recess is about 90 feet in length, and is so constructed that it can at any time be converted into a small graving dock by placing a gate across the entrance, and pumping out the water which may have accumulated in the chamber, thus also obviating the necessity of removing the caisson itself for repairs. It is expected that the dock may be opened in a few minutes at any time of the tide, and in almost any sea or weather, or during a considerable current through the entrance, by means of these caissons. Lowering or folding bridges, also of Mr. Kinniple's patent, have been fitted on the tops of the caissons, and provide roadway and, if need be, railway communication across the entrance. These bridges, by coming in contact with curved plates, automatically lower or raise themselves during the process of opening or closing, as also the hand-rails, so that one man only is required to work or control the machines for opening and closing each entrance of the dock. The dock itself is a very substantial piece of work. The walls have curved toes of brickwork and concrete, founded from 2 to 6 feet 6 inches below the bottom of the dock. From the top of these to about low water sandstone has been used, and from low water up to the underside of the coping the walls are faced with finely-dressed granite, the whole being backed with Portland cement, rubble, concrete, and finished with massive granite copestones. At the circular corners, where the tear and wear will be considerable, special granite bond stones are added. Mooring bollards are set up at distances of 46 feet apart along the coping line or face of the walls, so that the traffic along the quay line will not be obstructed by mooring chains or ropes. It is proposed to use the jetty exclusively for the shipment of coal, for which purpose a high level viaduct will be formed upon which the waggons will be run direct from the railway, and the coals tipped from shoots into the hatches of the vessels lying alongside. On the south side of the dock large sheds and warehouses, capable of storing 20,000 tons, have been erected at a cost of 7,000*l*. The sheds are 225 feet and 275 feet in length and 107 feet wide, are built of brick, supported by iron columns and girders, and have iron roofs. The warehouses are also of brick, and are 180 feet long by 107 feet wide and 96 feet in height from the quay level to the ridge of the roof. A covered way

ARTISTIC SANITARY WALL-HANGINGS.

DURO-TEXTILE, Combines all the artistic and hygienic effects of a Painted Wall, at a great saving in cost. Can be SCRUBBED with Soap and Water any number of times without injury.

And so on to any amount.

In the transaction of speculative business Messrs. C., S. & Co. make no charge for commission or brokerage whatever unless their client makes a profit, when they take 5 per cent. of the profit made as their remuneration.

All transactions advised by wire as soon as completed. Monthly Circulars and Mining Reports post-free on application.

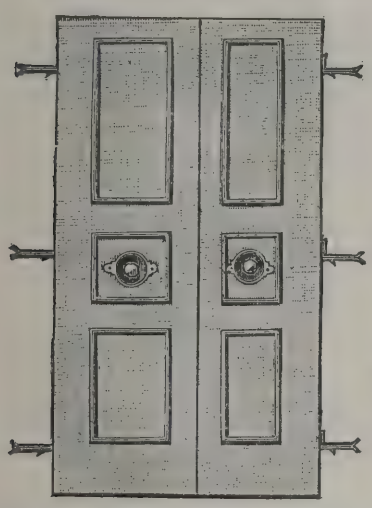
COLES, STEWART & CO., St. Stephen's Chambers, LONDON, E.C.

facing the dock runs along the entire front of the warehouses and sheds, on a level with the first floor of the warehouses. The principal use for which these are intended is for the storage of sugar, grain, and a general cargo; and for the purpose of facilitating the storage of goods a double line of railway has been run along the entire length of the sheds and warehouses. Two large travelling cranes have already been erected at the dock. A subway across the western entrance leading from the south to the north side of the dock has also been constructed for the passage of water, gas, and other pipes, and for giving communication with either side of the dock while the entrance is open.

The contract drawings and specifications were prepared by Mr. W. R. Kinniple, C.E., and the works carried out under his superintendence by Mr. John Waddell, contractor, Edinburgh. The building of the sheds and warehouses was entrusted to Messrs. J. & R. Houston, of Greenock, and Messrs. Tannett, Walker & Co., of Leeds, supplied the hydraulic machinery for the working of the entrances, as also several of the large cranes, while the caissons were made by Messrs. Kincaid & Co., engineers, Greenock.

THE BUILDING TRADE IN AMERICA.

THE industrial situation throughout the United States has, according to the Chicago *Inland Architect and Builder*, very greatly improved within two or three weeks. Stated in the fewest possible words, the volume of business is quietly swelling. Clearing House exchanges show a steady expansion, manufacturing interests are in vigorous health, demand for all kinds of manufactured products is increasing, collections are good, commercial failures have fallen off 1,000 in round numbers as against same time last year, and liabilities have decreased one-third. There is a widespread improvement in building activity; confidence has been largely restored; capital is seeking investment. The list of permits in all the larger cities show up well, and are in nearly all cases ahead of last year, east and west. The flow of capital westward and southward continues. Industrial enterprises are multiplying there, and railroads are opening up new and rich regions, and inviting capital, enterprise, and labour. There is much of interest to note in all departments of activity. Builders are pushing with vigour. Boston, New York, Philadelphia, and more western cities furnish statistics of building operations which show that whatever apprehensions were entertained earlier in the year have been dismissed. The great demand is for homes. While costly residences are going up in large numbers, the greater enterprise is shown in the erection of smaller houses, costing from 1,500 dols. to 3,000 dols. Building material continues cheap and abundant. Lumber is in liberal supply at all points, and firm in price. The South is furnishing large supplies of yellow pine in eastern markets, while Chicago and other white pine markets are shipping their usual enormous supplies east and west. The hardwoods are in quite active demand for interior finish and furniture-manufacturing purposes. Prices for all kinds will very probably remain stationary.



Brick, stone-cement, lath, plaster, &c., are in abundant supply at all points. Possibly an exception could be made in the case of bricks at two or three points where states have obstructed production for a time, but just now the yards in all sections of the country are believed to be full. Prices are stationary.

The iron trade has escaped any serious upheavals. The question of wages has been settled for another year at Pittsburgh. The nailers have agreed to resume. Prices for all kinds of iron and steel are low. Nails 2.00 dols. at mills. A strike is under way among eastern puddlers. The mills making structural iron for building purposes are running full time all through the East, and managers are assured of an active season demand. Angles are 1.90 dols. and beams and channels, 3 cents. The mills on galvanised iron are all fairly busy.

Real estate is improving in value along the lines of roads leading into the North-West. While there is much land offering, both rural and city, there is not enough to cause any serious depression in prices. Holders feel it is safe to hold, for the tide of population is in their direction.

Real estate in cities generally is firmly held. Much of it has been purchased this year for house building and manufacturing sites. Architects have felt the effects of summer strikes but for all sources of information available, it is evident tha they have recently received instructions to prosecute work to early completion. Investments in house building are profitable and encouraging.

The commercial situation is much better than a year ago. Failures are 20 per cent. less. Liabilities reach only about fifty million dollars as against about seventy-five million dollars for the first six months of last year. Money-lending institutions

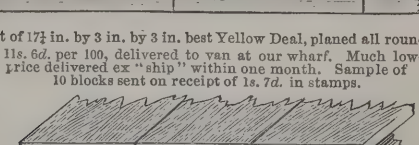
are liberal, and rates of interest are low. New opportunities are being sought, and enterprises hunting for work. Railroad building has been cautiously pushed for six months, less than 1,300 miles having been built, but from this date work will be pushed with vigour. The railroad companies have put each other under bonds to keep the peace, and they are doing so with more or less general satisfaction. Things are moving on about as well as can be expected. Fortunes are not being accumulated perhaps with the same ease, but the country at large is growing in the right direction. The manufacturing industries are thriving. Production is not deluging the channel of trade. Prices are fairly remunerative; consumption capacity is expanding. Labour troubles have been overcome. Conservative leadership has the reins. The outlook is encouraging, but the era before us is not one wherein sloths or imbecility can win. In fact, greater energy is now more imperatively demanded.



COLONIAL AND INDIAN EXHIBITION.

A PAPER on "Railway Extension in the Colonies," was read at the conference on Tuesday, July 27, by Mr. J. S. Jeans. The author began his paper by pointing out that this was a subject of almost equal interest to the colonies and the mother country—to the former because no other single influence could so materially aid their development, and to the mother country because she would for a long time be called upon to supply the greater part of the materials of construction, and because the colonies would take more of our home produce the more they were able to export themselves. The experience of the United States had shown that there was a close relation between railway facilities and the development of foreign trade, and that the more the exports were increased, the greater was the volume of imports, although the two did not exactly nor necessarily run on all fours. Britain now imports over 125 million pounds worth of food supplies, of which America furnishes fully 30 millions worth. It is of great importance to England to endeavour to assist the colonies to take the place of the United States in this regard, because the United States were a hostile nation in commercial affairs, imposing, as they did, an average duty of 45 per cent. on the whole of their imports, with a view to the exclusion of foreign commodities. The immense development of the trade of the United States within recent years was clearly traceable, in great part, to railway extension. There were now 130,000 miles of railway opened in the United States, whereas our Australian colonies had only 7,000 miles for an almost equal area; and Canada, for a larger area, excluding Alaska, had only 10,000 miles. Assuming that a railway contributed to the opening up of a country for 20 square miles on either side, the railways of the United States would be equal to opening up about 5½ millions of square miles, or nearly double the absolute area of the country, excluding Alaska, whereas the railways so far built in Canada were only equal, on the same basis of estimation, to opening up about 400,000 square miles, or very little more than one-ninth of the whole. The railways of India provided for opening up about half a million square miles, or rather over one-third of the whole; and the railways of Australia provided facilities for 280,000 square miles, or one-eleventh of the whole continent. The total mileage of railways now constructed in the British Colonies was about 30,000 miles, being an average of one mile to every 7,397 of the population, and every 269 miles of area. In the United Kingdom there is one mile of railway to every 6½ miles of area, and in the United States one mile of railway to every 25 miles of area. If our colonies had the same relation of railway mileage to area as the United States, their total railway mileage would be upwards of 330,000 miles. The freight rates of our colonies were generally higher than those of Europe, but in India and in Canada they were lower. The latter country had to arrange railway rates so as to compete for trans-Continental traffic with the United States, where, within the last ten or twelve years, the rates had been reduced on an average by one-half, and where freighters were now paying the railways a hundred million pounds per annum less than they would have had to pay for the same volume of traffic in 1872. It was of great importance to our colonial progress that the rates should be kept low, as this would develop traffic more rapidly, and better enable the colonies to compete with the United States. That they were able so to compete had been sufficiently proved by the enormous increase in their exports of bread-stuffs to Europe within recent years. With the exception of India, Queensland and New South Wales, in each of which the railways were now paying over 4 per cent., the colonial railways were not generally so remunerative as to tempt capital on their merits. Canadian railways only paid an average of 1·4 per cent.; Victorian railways, 2·91 per cent.; New Zealand railways, 2·51; and Cape Colony railways, 2·65 per cent. Railway promoters should endeavour not only to ascertain the traffic actually existing or available, but also the traffic likely to be created.

WILLIAMS & CO.,
Lillie Bridge Works, London, S.W.,
MANUFACTURERS OF PATENT
METAL CASEMENTS
AND
LEADED WINDOWS.
Our Patent Steel "SIMPLEX" Casements have the following advantages over any other Casements in the market:—
They are thoroughly weathertight.
They can be made to open inwards or outwards, hung at the sides, or head, or sill, and in all cases the PLANE OF GLASS and the SIGHT LINE are the same.
They will not SAG, or TWIST, or JAM.
The Glass being secured by metal fillets the ragged appearance of putty is avoided.
The face being moulded has a more pleasing appearance than the ordinary uncouth finish.
By the use of these Casements all difficulties of window-cleaning are overcome.
The Patent "Cottage" Casement is made for such positions where plane of glass and thorough weathertightness are not absolute requisites, and where the extent of finish is not necessary.
Prices and particulars will be gladly furnished on receipt of inquiry.

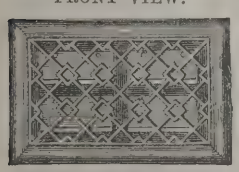
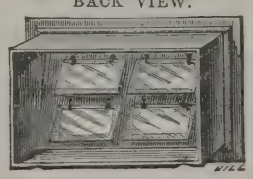
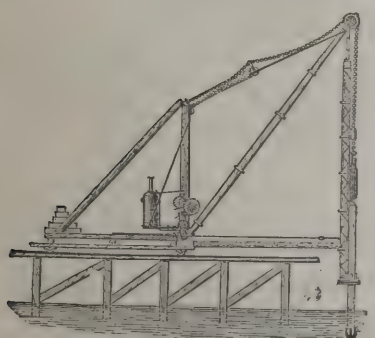
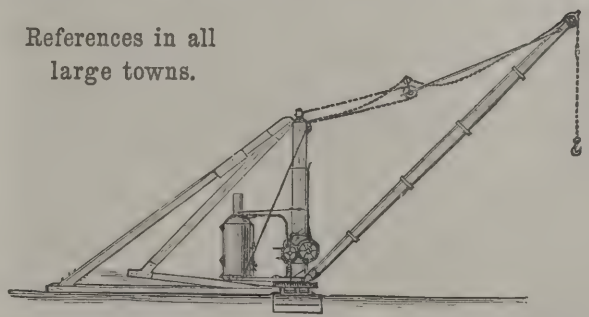
Write to Leith for Particulars.

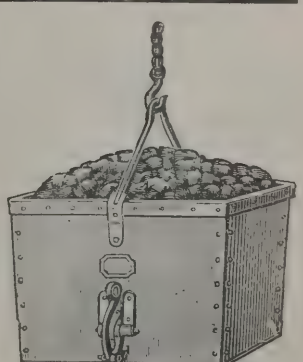




Experience had shown that in the colonies traffic developed very rapidly, and in some cases a net traffic of less than 300*l.* per mile per annum was equal to yielding a dividend of over 4 per cent., whereas it required over 1,700*l.* per annum to pay the same rate in England. It was of the greatest importance to the colonies that they should be furnished in the shortest possible time, and on the greatest attainable scale, with railway facilities, in order to transport the produce of their wheat-fields and vineyards, their sheep-runs and their cattle-ranches, to the markets of Europe, and for this purpose colonies were justified in undertaking an expenditure and incurring a debt that would not be otherwise justifiable.







MANCHESTER SHIP CANAL.

ALTHOUGH the Manchester Ship Canal is not to be commenced at present, an abstract of the arrangements made with the contractors may still have interest. Messrs. Lucas & Aird entered into a contract with the Company to construct the canal, with the docks at Manchester, Salford, and Warrington, the swing aqueduct at Barton, the various locks required along the course of the canal, the branch railways and the necessary railway deviations, and all the incidental works authorised and required by the Company's Act of Parliament, and to complete the same from their commencement for the sum of 5,750,000*l.* The contractors subjected themselves to heavy penalties in the event of their failure to complete the works within the specified period. Should the works not be completed within the four years the contractors were for such period as they extended the time to pay interest on the whole amount of the capital then called up, at the rate of 4 per cent. per annum; but, on the other hand, should the work be carried out within the four years they were to receive a corresponding allowance of 4 per cent. interest on the paid-up capital as a bonus on their contract during such period as the work should have been completed within the specified time. The next largest item of expenditure in connection with the Ship Canal project, but which was really the first that would have to be provided for, was the purchase of the Bridgewater Canal undertaking and the Mersey and Irwell undertaking, which involved an outlay of 1,710,000*l.* The other land necessary for the construction of the works, including the cost of purchase and conveyance, was put down at 802,936*l.*, and the Parliamentary expenses, being the cost of the Act, at 146,000*l.*, making a total outlay in connection with the complete carrying out of the project of 8,408,936*l.* It was estimated that in the earlier stages of the work something like 20,000 men would be required, a much-needed means of employment would be afforded, which would be a very great relief to the present depressed state of trade in the district. It was the intention of the contractors to commence operations by laying down a line of railway on each side of the route of the canal, and the working plant would require about 6,000 railway waggons and about 300 locomotives. The cutting of the canal was to be divided into sections, operations proceeding simultaneously in each section, so that the work might be completed within the shortest time possible.

COMPRESSIBLE FOUNDATIONS.

THE subsoil at Chicago, U.S., is wet clay, and yielding to an extent which has caused serious difficulties on many of the heavier buildings by the unequal settlement. One of the most prominent examples is that of the United States Government building, which was built upon a bed of concrete 3 feet in thickness; the inequality of the pressure upon the foundations has caused an uneven subsidence, and many undesirable consequences have taken place. The concrete foundation has become broken, and cracks in various portions of the masonry, even to distortion of arches, and in two instances stones are reported to have dropped from the decorative work (on April 21), to the jeopardy of persons on the sidewalks around the building. As an example of what can be accomplished by the exercise of engineering skill under similar limiting conditions, the Home Insurance Company's building in the same city is a fireproof structure of great weight, being 160 feet in height, and constructed of masonry and iron. The foundation consists of independent piers built of alternate courses of dimension stone and rubble, and the area of the bottom carefully proportioned to a surface of a square foot to each two tons of load to be supported by the pier. In this manner each basement pier and each vertical line of columns rested upon an independent foundation, which was loaded to a uniform intensity per square foot. The beams and girders were very securely anchored together at walls and at intersections, and strips of band iron built into the masonry over arches and other places where reinforcement might be desirable. The whole build-

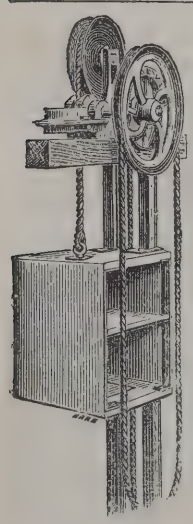
ing has subsided 2¼ inches, but owing to the care in placing loads of uniform intensity of stress upon the foundation, the maximum inequality in settlement has been only 11-16ths of an inch. In our day and generation the wise men are not limited to those who build their house upon a rock, but must include those who make the sand as stable in its resistance as a rock. The original peninsula comprising the city of Boston, U.S., has been distorted into some other geographical form, and more than doubled in area by the filling over the harbour and estuaries by about 16 feet of gravel over clay and mud forming the bottom. The large buildings constructed upon this "made land" have received the benefit of skilled engineers in regard to the distribution of the loads upon the piling which support the stone foundations, and bid fair to remain permanent without any distortion, but many of the elegant private residences on the Back Bay district of the city, being erected under the sole direction of architects who did not avail themselves of the work of engineers familiar with that special branch, have settled irregularly, and many fine buildings are marred by cracks in walls and ceilings. This criticism does not apply in so great a measure to many of the later buildings where more judicious measures have been introduced to provide for uniform settling. The architects are not alone at fault here, for the abutment piers of a highway bridge over a railway on this district were moved laterally, foundations and all, some twelve years ago by the earth pressure caused by the approaches.

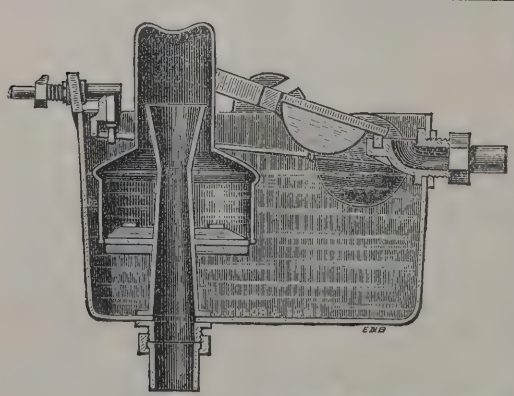
AN ENGLISH CONTRACT AT PALERMO.

IN the year 1880 the Italian Government passed a project of law to provide for the execution, within a period of ten years, of the works most urgently needed:—1. Public works; 2. Rivers; 3. Drainage of marshes; and 4. Ports. The total cost was estimated at 29,910,000 lire, or over one million sterling.



The port of Palermo had assigned to it the sum of 3,140,000 lire for rock excavation, and 230,000 lire for a wharf wall to be constructed at the Quattro Venti as a frontage to the new custom-house. The first-mentioned work for the rock excavation was let by contract at public tender to Mr. George Furness, of London, in the year 1882, and it was stipulated that the work should be completed in six years, dating from August 1883. The quantity of rock is about 100,000 cubic mètres, or 130,799 cubic yards. The price is 22 lire 12 c. per cubic mètre, or 13*s.* 6*d.* per cubic yard, measured in nature by soundings taken before the commencement and after completion. No payment is made for any excess of excavation either in area or in depth below the 7 mètres (23 feet). The nature of the rock is silicious, generally soft; some strata are hard, and a very small quantity has been found as soft as chalk.

A new plant was provided by the contractor at his own cost, consisting of a hopper dredge to hold and carry 180 cubic mètres, or 243 cubic yards; two floats of timber for the boring machines, each carrying four drills; and a workshop fitted up with forges, lathes, drills, and other machinery, and tools for keeping the plant in repair. The number of men employed is usually forty-nine for the dredge, drilling, and repairs; but, when the second float is at work, the number is then sixty, and when extraordinary repairs are going on as many as thirty additional men are put on, but this is only for a short period of time.



ECONOMIC WATER SUPPLY.

ON Saturday last several gentlemen interested in the economic water supply for towns and institutions met at the Henley Waterworks to view the working of the "Atkins' Patent Water Softening and Purifying Apparatus," which has been supplying the whole town for the last four years. This apparatus is an adaptation of the "Clark" system for softening water. The hard water is pumped into an automatic mixer, a small quantity being diverted, passed through a cylinder containing lime, whence it issues as a saturated solution of lime-water and rejoins the bulk of the hard water. The lime-water and hard water then flow through the mixer into a softening cistern. This cistern is always full, and the water travels slowly from the one end to the other in the course of an hour, by which time softening is effected; but the water has a milky appearance, owing to the presence of carbonate of lime in suspension. In this state the water is conducted to the filters, where the deposit is arrested, and the water, softened and filtered, is received by a duplicate pump and forced to the reservoir.

The whole process is automatic and continuous, and at the end of the day the filters can be cleaned in a few minutes by the aid of steam power. The special merit of this system is the small amount of labour required, which is an important item in large institutions.

ULVERSTON, LANCASHIRE.

BEAN'S PATENT DIRECT-ACTING VALVELESS WASTE-PREVENTING CISTERNS.
These Waste-Preventers are simple in construction and rapid and powerful in action. The working parts have been improved and are well balanced. The arrangements for charging the siphon are such that a slight pull by hand is all that is necessary to cause the immediate and automatic discharge of the contents of the Cistern.
THE CHIEF ADVANTAGES are—(1) the direct-acting method of charging the siphon, by which the full flush is obtained at once; (2) simplicity of construction; (3) no valve in the bottom of the cistern to cause leakage; (4) no tight-fitting parts to corrode or get out of order; (5) no waste incurred by fastening the "pull"; (6) insures a rapid and regulated flush without holding down the pull.

ACCIDENT AT THE PRINCE OF WALES'S THEATRE, BIRMINGHAM.

A RATHER remarkable accident caused by the fall of a girder occurred at Birmingham on Friday. The roof of the stage of the Prince of Wales's Theatre is being raised, to allow of additional space for scenic machinery above the top of the proscenium, and the period of closure being somewhat short a numerous body of workmen have been employed by the contractors, Messrs. Sapcote & Son. The roof span being large three girders were to be introduced for its support, and these were to lie upon piers of brickwork carried up against the walls to a height of about sixty feet. For the purpose of raising them into position a lofty derrick was arranged upon the stage, which had been previously shored up beneath, so as to sustain the weight. The first girder had been successfully placed over the proscenium, and the raising of the second was undertaken. It was about 43 feet in length by 3 feet deep, and weighed upwards of six tons. About half-past nine o'clock on Friday morning a number of men by means of pulleys had raised it clear of the position in which it was to be placed. As it was being lowered into rest one of four guy-ropes by which the derrick was held in position gave way, and the structure began to topple towards the gable end of the building, which overlooks the premises of Messrs. Lindner & Co., merchants, in King Alfred's Place. The men endeavoured to guide the girder on to its bed, to which it had only some two inches to fall, but it appears to have swung round over the end wall, and then, snapping off the top of the derrick, to have slipped over endways into a portion of Messrs. Lindner's premises, the roof of which was thirty feet below. Three rooms forming a portion of the offices were demolished. These offices rested on beams stretched over part of a yard, and the lower end of the girder, crashing through the roof, fell against the outside beam, pushing it some yards out of its place and causing the floor to give way. At the time of the accident, Mr. Lindner, Mr. Leitner, a partner in the firm, and a clerk were engaged in one of two small rooms just under the wall of the theatre. They had only just been remarking the height to which the wall had been carried, when some of the brickwork, struck by the girder, came falling through the sky-light. Mr. Lindner and the clerk retreated to the warehouse through one door, and Mr. Leitner was endeavouring to get to a place of safety through another, when the girder fell, and he found himself precipitated among a quantity of *débris* into the yard below. When he was found it was discovered that he had not sustained more serious hurt than some severe scalp wounds, and was perfectly sensible. He was extricated by some of the employés, aided by the builders' workmen, who came running from the theatre. A further cut upon the head was caused by a falling brick as he was being got out. The chair in which Mr. Leitner had been sitting only a few moments before the fall was crushed to matchwood. Fortunately, one of the demolished offices was at the time unoccupied. It is also remarkable that none of the workmen in the theatre received serious injury, although several were placed in peril by the derrick falling against some of the scaffolding. Had the girder descended inside the theatre there could hardly fail to have been loss of life.

ASSOCIATION OF MUNICIPAL AND SANITARY ENGINEERS.

THE annual meeting of the Association of Municipal and Sanitary Engineers was held lately at Hanley, under the presidency of Mr. Lobley, the local surveyor. According to the annual report twenty-five new members had joined during the past year. There are now 244 ordinary and six honorary members. It was recommended that the next meeting should be held in Leicester.

Mr. Lobley devoted his presidential address to a description of the town. The difficulty of carrying out work is suggested by the fact that almost the entire town is honeycombed by iron and coal workings to the great detriment of the buildings and pavements on the surface. Ordnance bench marks are no use at all until checked, and that must be done each time they are used. Streets between Hanley Station and the Town Hall have marks which are from 3 feet to 6 feet lower level than when taken by the Ordnance Surveyors. This subsidence causes gas, water, and sewer-pipes and branches to give way, and this in its turn causes the roadway surfaces to be continually broken into for repairs. Such pavements as may be seen in some of our large towns must not, therefore, be looked for, and even the macadamised roads cannot be expected to be as good as they should be when these excavations are so frequently made. One work was referred to in illustration, viz., the Bucknall Road canal bridge. The gradients of the road leading up to and over this canal are

very heavy, ranging from 1 in 14½, which the tram engines have to overcome between Stoke-upon-Trent and Hanley, to 1 in 12 on the Newcastle Road, and 1 in 13 on the Fenton Road, and 1 in 11 on the Bucknall Road. The soffit of the bridges must be high enough above the water to give facilities for the local traffic, and in order not to increase the gradients the road surface must be kept down to the lowest possible point. The depth, therefore, between the soffit of the bridges and the road surface on the top does not exceed 16 inches to 18 inches. The Bucknall Road bridge has been twice raised in consequence of subsidence through coal-workings. The water-level remains unaltered, but as the banks and bridges subside, so must they be lifted. The first raising took place in 1883 and the second in 1885, and it is expected to require raising again next year. The most costly part of the operation is, however, not raising the bridge, but adjusting the road levels on each side of it, and each raising makes the gradient worse. The retaining walls on each side of the road are also built thick enough to allow for several subsidences and extensions upwards.

Sewage Utilisation.

Mr. M. Ogle Tarbotton read an elaborate paper on "Some Recent Sewage Operations in Nottingham and its neighbourhood." Having described the sewage farm, which had been laid out under his direction, he said, in conclusion:—The primary object of all works of a hygienic nature is to raise the standard, physically, morally, and intellectually, of public health and happiness, and this cannot be accomplished without some corresponding expenditure. It is perfectly useless to demand large sanitary improvements, and expect the public purse to remain unmolested. This particularly applies to sewage operations, and those allied therewith. Sewage has not been found to yield an income in alleviation of the rates of either a small or a large town, and never will, and the more complicated the question is made the more will be the annual deficit. Also, whilst the compensatory value of sanitary labour and outlay is not capable of being accurately expressed in terms of money, there is always the danger of apathy, and even discontent, arising from the very success of the works undertaken, remembering that "Preventive measures are obnoxious to obloquy, for the more successful they are, the least apparent is the need of them."

Maintenance of Roads.

Mr. E. B. Ellice-Clark, in his paper on this subject, said that the cost being given per mile without further data on which to form an opinion, it is obvious that the maintenance of a wide level road, open to the weather, with little traffic, must be much less than that of a narrow road of steep and numerous changes of gradient, with an equal traffic, so that when we find a main road in one parish costs 40*l.* per mile to maintain and another costs 400*l.*, there is little to be gained by discussing the figures given in county returns, and we must rely upon general observation. He then referred to the existing authorities and the laws relating to the subject, pointing out the failure of the Highways and Locomotives Act. Of the difficulties encountered in working the Act of 1878, that relating to the accounts is not the least. A special form of account has to be kept under the provisions of the Act, by which every hour a man is employed on a main road must be entered, every load of materials, the quantity of water and the team labour all have to be separately entered and charged to the main road account. The town of which he was surveyor had 28 miles of roads and about 1½ miles of main roads. The work of maintaining the main road is inseparably mixed up with the maintenance of the other roads. Workmen pass without knowing it from ordinary roads to the main road. Machine sweepers and water-carts do the same thing, a load of water may be half distributed on a main road and half on an ordinary road. In towns employing a large number of water-carts, say thirty, it is impossible to sever the work. A main road requires a separate staff, separate carts, separate foremen, separate supervision, to keep the accounts with anything like accuracy, and if a main road is of insufficient length to provide this separate administration economically, the cost of book-keeping and dividing the cost of maintenance will amount to a large percentage upon the cost of maintenance, and the writer ventures to express the opinion that such an accurate subdivision of accounts as the Act contemplates is nowhere kept, a great many of the items being arrived at but approximately. The same objections apply to the system in rural districts, where there is no clerical staff provided to do the work. A simple, safe, and effective remedy can be obtained by grappling boldly with the subject. Sweep away all distinctions between disturnpiked roads, roads connecting large towns, and county or parish roads, and let all roads that are now repairable by the inhabitants at large be repaired by a single authority, adopting the county or division of a county as the unit of area. As an arbitrary line must be drawn somewhere between the rural and urban districts, fix a principle of demarcation, and exclude all towns of 10,000 inhabitants from the cost of a contribution to

MR. C. B. HARNESS, the Eminent Consulting Medical Electrician, has been specially retained by the Company, and may be consulted daily (without charge), on all matters relating to health and the application of Curative Electricity. Residents at a distance, and those unable to avail themselves of a personal consultation, are invited to write for a PRIVATE ADVICE FORM, which will be forwarded POST FREE, on application to THE MEDICAL BATTERY COMPANY, LIMITED, 52 OXFORD STREET, LONDON, W.

On receipt of Post Office Order or Cheque, value 21s., crossed London and County Bank, THE MEDICAL BATTERY COMPANY, LIMITED, 52 Oxford Street, London, W., undertake to forward the ELECTROPATHIC (BATTERY) BELT, as described above, for either Lady or Gentleman, free by post to any part of the United Kingdom.

"ELECTROPATHY; or HARNESS' GUIDE TO HEALTH," will be sent post free on application to the

The MEDICAL BATTERY CO., Ld., 52 OXFORD STREET, LONDON, W.

the county roads. County roads cannot be efficiently maintained without a complete change in county government. Presuming such a change, and an elected Board superseding the present justices, a scheme something on the lines of the following should be administered in the highways department:—Board for the whole or divisions of a county, having a chief engineer. The area of the county or divisions, subdivided into districts, which might be determined by (*a*) watershed considerations, or (*b*) facilities for access by railway, or (*c*) density of population (*i.e.*, proximity to large towns). Each district to have its surveyor or inspector, acting under the orders of his chief, who would be responsible to the Board, with the sewerage and other matters that do not touch the present discussion, and roads under his immediate charge. We should thus have (1) trained men, as paid officials, devoting their whole time to the duties of their office, directly responsible for the proper and economical upkeep of the roads; (2) a standard of efficient maintenance for the whole county would be set up, for which the Board would hold the chief engineer responsible; the divisional inspector would set up this standard of efficiency at comparative costs, for the books should show at a glance what a unit of roadway was costing in each division.

Economic Production of Coal-gas.

Mr. R. P. Spice, in his paper, called attention, among others, to the coal-liming process patented by Cooper, which, he said, was now thoroughly established. This method of dealing with the impurities contained in crude coal-gas had been in uninterrupted use at Tunbridge Wells for two years and eight months, and had never failed to yield to the prescribed treatment. So thoroughly were the conditions understood that the character of the coal being ascertained, the results as to the reduction of the sulphur compounds could be accurately foretold. He dwelt at great length on the advantages of this process, and he also advocated the application of the principle of gaseous firing to the carbonisation of coal initiated many years ago by the late Sir W. Siemens, but which had only recently come to the front.

Mr. Ogle Tarbotton said the process referred to was new, and, like all new matters, had to go through a number of phases. The want of appreciation of this process, he believed, was due to absolute prejudice in many parts of the country. People abused the process without trying it. Mr. Spice said there was no reason whatever why the process should not be tried, because it could be tried anywhere without one shilling extra capital being required, and he was prepared to prove anywhere that it was economical and beneficial in every way.

Watering Streets.

Mr. W. S. Crimp first described the Paris, Brown's, the hose-reel, and the tank or van methods of road-watering, and gave statistics to show that the last-mentioned was undoubtedly the cheapest. Sea-water, where available, might be used with advantage for laying the dust, as the salts which were left on the surface after the water had evaporated absorbed moisture from the atmosphere and from the subsoil, humidity thus being maintained for a period dependent on the amount of the salts and on the hygrometric conditions of the atmosphere, and consequently streets required to be watered less frequently than where ordinary water was used. Sea-water might be artificially prepared by dissolving sodic and calcic chlorides in water in the proportions of ½ lb. to 1 lb. of the mixed salts to each gallon of water, and from experiments made it had been ascertained that 1,480 gallons of such a solution were for street-watering purposes equal to 5,630 gallons of plain water. But although sodic and calcic solution rendered it unnecessary to lay the dust so frequently as when water alone was used, yet when the cost of the two was taken into consideration, it did not appear that there was any economy in substituting the solution for ordinary water where the latter could be procured at an ordinary rate.

THE LATE WILLIAM MAY.

MR. WILLIAM MAY, of Pool, Cornwall, died at the age of seventy-three last week, after a short illness, and is buried in the churchyard of Illogan, the scene of his earliest labours. The deceased had carried on business as a contractor for nearly fifty years, and executed a large quantity of work, chiefly for Mr. St. Aubyn, but also for the late Mr. Street, Mr. Hayward, of Exeter, Mr. Ewan Christian, and Mr. White. The deceased took great pleasure in his calling, and exercised it in the most honourable manner, so that he was held in the highest repute. In latter years, owing to declining health after an accident, he was obliged to refuse a great deal of work. Few men were better known in Cornwall, and his loss will there be much deplored.

A nephew of the deceased, Mr. T. F. May, is at present at Leicester, where he holds the appointment of clerk of works at the new post-office buildings.

"THE PEDESTAL VASE,"

JENNINGS' IMPROVED W.C. APPARATUS

(Combination Urinal and Slop Sink).

Registered No. 16,300.

A PORCELAIN VASE set on a tiled or mosaic floor, within walls or a dado of glazed tiles. The usual wood framing, forming a storehouse for the retention and accumulation of *damp*, *dirt*, and *disease germs*, with the joints, crevices, and imperfections in work which the closet enclosure so often conceals, is entirely abolished. The seat is hinged, permitting free access for use as a *slop sink* or *urinal*, and for cleansing, so that the entire apparatus and space can be freely washed down. For this latter purpose the floor should be slightly sunk, and laid to fall to a grating, with waste carried through the external wall, and terminating in a copper flap valve to prevent draught.

☞ The suggestions as regards wall linings and floor, may, of course, be modified as best adapted to the building in which the closets are used; and in the consideration of such details, alternative schemes will readily present themselves.

At the recent **HEALTH EXHIBITION** (South Kensington, 1884), amongst a series of official tests, under the supervision of Baldwin Latham, Esq., C.E., and the Jury No. 9, Class XXIII., and successfully withstood by this closet, the following may be cited in evidence of its efficient action. Being fixed in position shown in illustration, with **"JENNINGS' PATENT SINGLE FLUSH WASTE-PREVENTING SYPHON CISTERN"** 5 feet over, with 1½ inch down pipe, ten apples (averaging 1¼ inch diameter) and a flat sponge about 4½ inch diameter were thrown into the basin. The water, as well as the whole of the exposed or dry surface, was first blackened with plumber's "smudge," and the sides covered by four pieces of thin sanitary paper, which adhered closely to the soiled surface. The handle of the cistern was then pulled, and the two-gallon flush liberated. After seven seconds (the time occupied by the discharge), a receiver placed under the trap outlet was removed, containing in the blackened water **the ten apples, the sponge, and the four pieces of paper,** no traces of the soil remaining visible upon any part of the apparatus.

GOLD MEDAL AWARDED.

THESE CLOSETS are already in use in Hospitals, Banks, Hotels, Offices, Private Residences, &c., with most satisfactory results, and, fixed in the manner described, in appearance and action leave nothing to be desired. By the novel arrangement of the supply to Basin, as shown in the sectional sketch annexed, the whole surface is well flushed and cleansed, whilst the bottom of Basin and Trap are thoroughly scoured by a concentrated rush of water which insures the **instantaneous removal** of the contents, thus overcoming the inherent defects in the many imitations recently produced of **"JENNINGS' MONKEY-CLOSET"** (the **original form of wash-out watercloset**), which was invented and patented by G. J. in 1852.

NOTICE.

We have appointed Mr. JOHN BERGER, *of New York, our agent for the United States and British North America, for receipt of Advertisements and Subscriptions to* THE ARCHITECT AND CONTRACT REPORTER.

EDITORIAL NOTICES.

The authors of signed articles and papers read in public must necessarily be held responsible for their contents.

No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.

Correspondents are requested as much as possible to make their communications brief. The space we can devote to Correspondence will not usually permit our inserting lengthy communications.

LEGGOTT'S PATENT ADJUSTMENT,

FOR FANLIGHTS, SKYLIGHTS, &c.,
Is admitted to be the best ever put before the Public.
From 5s. each.
Write for REDUCED PRICE LIST and Testimonials to
W. & R. LEGGOTT,
70 Park Road, Bradford, Yorkshire.
N.B.—Size and height of window no object.

TESTIMONIAL.
BANGOR, N. Wales: September 14, 1885.
Sirs,—I have pleasure in testifying that I have used Leggott's Silent Adjustments for various buildings to high skylights, fanlights, and top parts of windows, and in every case they gave satisfaction. They are secure in whatever position, whether the window is open or closed, and are quite simple and workable in their action. I prefer them to any other that I have seen or used for the above-mentioned purposes.—I remain, yours obediently, R. DAVIES, Architect.
Messrs. W. & R. LEGGOTT, Bradford.

Mr. HARRY PEARCE, 125 Great Portland Street, London, W., is no longer our Agent. All direct communications shall have our prompt attention. W. & R. L.

FLAT BRICK FIRE-PROOF FLOORS.

LONDON, 1874.

LONGITUDINAL SECTION.

BRUSSELS, 1876.

THE BEST as well as the CHEAPEST Fire-proof Floors yet introduced. Their small cost makes them specially suitable for artisans' dwellings, residential flats, offices, chambers, and private houses.

They are constructed with hard-burnt bricks, laid flat, and bonded on the upper face with tough concrete 3 inches thick; and by the method of laying all iron is protected from the action of fire.

Experiments show a resistance to load and impact greater than furnished by the ordinary concrete floors. No thrust is transmitted to the walls, as in all arched construction, the walls being tied in and strengthened.

The floors are practically noiseless, the different densities of the concrete, brick and plaster, with the air space above, intercepting the sound vibrations.

The brick soffit forms a capital key for the plaster, and no laths or counterceiling are necessary, but for high-class work wood blocks are introduced in the soffit, to which the ordinary lath and plastering or fibrous plaster is fixed. This also provides a second air space, and furnishes the most perfect sound-resisting floors known.

They are not affected by water, acids, or alkalies, and they may be fixed during the progress of the building, thus dispensing with the use of internal scaffolding.

The concrete being tough instead of friable, the boarded finish may be nailed down without the use of sleeper joists. It is recommended to use an inch strip as a sleeper fillet. This will provide ventilation, and space for gas and water-pipes.

The depth of the finished floor is 6 to 9 inches only, and when the saving on this head is taken into account, the cost does not exceed that of the ordinary combustible timber floor of corresponding strength.

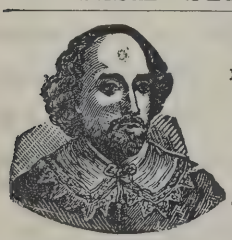
TRADE NOTES.

THE much admired windows exhibited at the Folkestone exhibition, representing the figures of *Apollo*, *Minerva*, and *Venus Astarte*, and also a splendid treatment of flowers, were the work of Messrs. Cox, Sons, Edgley & Co., the well-known workers of every description of ecclesiastical and domestic art. We may mention that, connected with this firm, is Mr. Thos. Cox, the only member of the original firm of Cox & Son now in England.

MESSRS. EDGAR KEELING, TEALE & Co., Art Metal Workers, of 14 Elm Street, Gray's Inn Road, London, W.C., have supplied the locks and door furniture for the London and County Banking Company's new premises, recently erected in High Street, South Kensington, from the designs and under the superintendence of Mr. Alfred Williams, architect, of Southampton Buildings, Chancery Lane.

MR. TALBOT B. REED has in the press an exhaustive history of "Old English Letter Foundries, with notes Bibliographical and Historical on the Rise and Progress of English Typography." The work will bring to light much curious information concerning the origin and development of type-founding in England, and will give biographies of the chief type-founders from the earliest times to the year 1830. It is to be issued by Mr. Elliot Stock.



MESSRS. WOODHOUSE & RAWSON, electric light contractors, of 11 Queen Victoria Street, have recently lighted up the New Club for the Caledonian ball and Mrs. McKenzie's ball, together with many other installations of a similar nature.

WE are authorised to state that Sir Henry Ponsonby has received Her Majesty's command to notify to the author of "Events in an Irish Country House in 1880" an acceptance of a copy.

WE learn that the authorities at the British Museum are introducing the electric light into several fresh departments.

Designs and estimates on application.

Messrs. Faraday & Son, of Berners Street, have the contract for fittings. This firm has extensions of a similar kind in hand for Messrs. Shoolbred, Tottenham Court Road, and are completing contracts for Sir Arthur Sullivan, for a theatre at Algiers, and the château of a senator of Brussels.

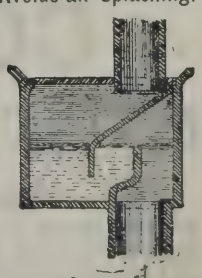
In our advertising columns will be found the prospectus of "The British Dinner Co., Limited," with a nominal capital of 25,000*l.*, divided into 25,000 shares of 1*l.* each, payable 2*s.* per share on application and 8*s.* on allotment. The company purpose providing good wholesome food, suitable for the working and other classes, at the lowest possible cost. They state that they will supply not only the same description as sold by the Aërated Bread Co. (which is paying a large dividend) and by Lockhart's Cocoa Rooms, but also a dinner comprising a soup or fish, a plate of meat and vegetables, at the minimum cost of sixpence, which is profitably done in Glasgow. We have no doubt that, if this is carried out, the undertaking should prove a financial success to the shareholders.

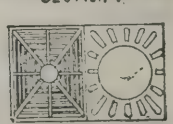
ST. GILES'S CATHEDRAL, EDINBURGH.

The Bruce memorial window has just been placed in the west end of the nave of St. Giles's Cathedral, by Cottier, of London. The subject of the window is "The Prophets"—"These are the prophets of whom our fathers spake," as is inscribed on a scroll in old English characters. The window has five lights, with a transom in the centre, giving ten compartments, in each of which the counterfeit presentment of a prophet is placed. The tracery above has been filled in with prophetic emblems—such as Ezekiel's wheel, &c. Reading from south to north, there appear in the upper compartments of the window Isaiah, Jeremiah, David, Ezekiel, and Daniel; and in the lower set, Amos, Jonah, Elijah, Zechariah, and Malachi. In the faces and habiliments of the figures something of the characteristics of the several prophets mentioned have been reproduced. The Shepherd King, attired in royal robes, plays on his harp; Jeremiah, in sombre raiment, laments over Israel; while the herdman of Tekoa appears in peasant's costume, and carries in his hand a shepherd's crook. The draping of the figures has been most successfully accomplished, the garments in which they are attired being picturesquely disposed about them in soft artistic folds. The figures, it may be said, are about 7 feet in height, and, if anything, err on the side of largeness.

BUILDERS AND BY-LAWS.

At the Poole Police Court a builder, Mr. A. S. Musgrave, of Westbourne, was summoned for erecting four dwelling-houses in Langley Road, Branksome Park, within the last two months, without giving proper notice to the Borough Surveyor before the commencement of such work. Mr. H. W. Dickinson appeared to prosecute, and stated that in May 1885 defendant submitted plans to the Town Council for the erection of ten semi-detached villas, in Langley Road, Branksome Park, but they were rejected because the by-laws had not been complied with. The plans were again presented later on, and were again rejected for the same cause. Nothing more was heard about them, and it was presumed that they had been dropped. The surveyor, however, discovered that Mr. Musgrave was building the houses upon the plans that had been rejected, without having given notice of his intention to build. He had therefore broken the by-law which required that notice should be given before the commencement of such work. John Elford, borough surveyor, stated that his attention was drawn to the buildings about a fortnight ago, when he saw several houses nearly completed and others commenced by the defendant. He had given no notice about his intention to erect the buildings. Defendant pleaded entire ignorance of the by-law requiring him to give notice to the borough surveyor before he commenced building. Mr. Pearce said there was no doubt that defendant had committed an offence, but the bench were inclined to deal leniently with builders when what they had done was in ignorance of the law. He would be fined 5*s.* and costs.





LIVERPOOL ENGINEERING SOCIETY.

On Friday last the members of the above society visited the Forth and Tay Bridge, on the invitation of the engineers and contractors of the respective undertakings. On arrival at Queen's Ferry South, the party was met by Mr. Cooper, the resident engineer of the Forth Bridge, who drew attention to the novel features of the special appliances for constructing this gigantic bridge. Having examined the various details connected with the south shore end of the work, the party embarked in the steam launch kindly placed at their disposal for the occasion, and proceeded to the north shore. Here the

PLAN.

"skew backs" which are now in position were examined with much interest. The mode of erecting the vertical members of the piers, and the skilful arrangement for raising temporary staging by hydraulic pressure, was explained by Mr. Cooper. The party were much struck with the progress made in all parts of the work since their visit last year, the whole of the foundation being now completed. The precautions taken against accident were also noted with satisfaction, riveters and others engaged on the elevated part of the work exposed to heavy winds, &c., being protected by a wire caging which also prevents tools and materials falling on the men below. The facility with which the riveting *in situ* is effected by means of the specially designed apparatus was thoroughly appreciated. At Dundee the party made an inspection of the Tay Bridge, on Monday, under the guidance of Mr. Searight, one of the assistant engineers. Here again a steam launch conveyed members to the various points of interest. One of the large bowstring girders in course of construction was seen, and the method of floating it into position in mid stream was explained. The opportunity afforded of comparing the design and execution of the old and new bridges was by no means the least instructive feature of the excursion.

COVENANTS REGARDING DRAINS.

AT the Liverpool Assizes on Wednesday, before Mr. Justice Cave, an action was brought for breach of contract in respect of the drainage of a warehouse in Hoyle Street, Liverpool, leased by Messrs. Green & Taylor to Mr. Harbord and others. The action was brought against the defendants, who are the trustees of the late Richard Harbord, a warehouse-keeper of the city, upon a covenant in a lease which plaintiffs obtained from the defendants of two warehouses in Hoyle Street, and by which the lessors were to repair, put, and maintain in order all outside drains of the warehouses in question. The question his lordship would have to determine, Mr. Bigham said in opening the case for the plaintiffs, was whether the drains were outside drains within the meaning of the covenant; while the second question would be what damages they were entitled to, having regard to the fact that they had given the defendants due notice of the defective drainage. The lease commenced in January 1884, and on September 28 of that year it was found that one of the drains had refused to act; the water came in, flooded the cellar, and very considerable damage was done to some goods stored there. On the 29th the plaintiffs' clerk notified the defendants of the occurrence, but no steps were taken to abate the nuisance. Hence the present action to recover damages. Plans of the property were produced, but his lordship expressed himself as being unable to understand that the drains were on the outside of the warehouse as meant by the covenant, and accordingly judgment was given for the defendant.

HARTLEPOOL HEADLAND.

A SCHEME long projected for the headland protection at Hartlepool was practically begun on Monday, when the mayor of the town laid the foundation-stone. The contract was signed on January 22, 1886, by Mr. T. A. Matthews, of Bolton, for the work, at a cost of 23,319*l*. Since that date Mr. Matthews has pushed forward his preparatory works with much energy, a considerable number of blocks having been already made ready for use. It is expected that the quantity of land reclaimed from the sea will exceed three acres, and will allow of a promenade 18 feet above high-water mark, with a promenade on the surface nearly three-quarters of a mile long, and varying in width from 20 feet to 130 feet. Mr. H. Main is the engineer.

AN ARCHITECT-BUILDER.

A CASE was tried at the Devon Assizes which suggests the risks of combining building with architecture. The plaintiff, Mr. W. B. Sivell, was formerly an architect and builder, but did not practise, and lived on a small property at Lympstone. The defendant, Mr. W. H. Peters, was a magistrate, and resided at Harefield. In the early part of 1884 the defendant thought it would be well to pull down a building at Lympstone known as the New Inn, and in its place put up some modern cottages. What he was going to do was talked about, and Mr. Sivell, although retired from business, taking an interest in the place, caused it to be brought to the knowledge of the defendant that he would be prepared to supply him with a sketch elevation of some very pretty cottages. Mr. Peters came and talked with plaintiff about the matter. Defendant said he could not think of accepting plaintiff's services gratuitously, but he should be glad if plaintiff would return to his old pursuits and act as

ARTISTIC SANITARY WALL-HANGINGS.

DURO-TEXTILE, Combines all the artistic and hygienic effects of a Painted Wall, at a great saving in cost. Can be SCRUBBED with Soap and Water any number of times without injury.

MURALINE, a highly-finished artistic washable Wall Paper, in beautiful designs and colourings.

EMBOSSED TAPESTRY, a high-class Wall-Hanging, fitted for superior Decorations, made in the most striking effects.

Patterns are kept by all Decorators and Upholsterers, or will be sent on application to

COLES, STEWART & CO.,
STOCK AND SHARE BROKERS.

Messrs. COLES, STEWART & CO. undertake every description of Stock Exchange business, and have special and early information on all leading Stocks; they are also continually advised by telegram from the chief Mining centres, both at home and abroad. For Investment Messrs. C., S. & Co. make only one charge of $\frac{1}{16}$ per cent. commission on all descriptions of Stocks, and open Speculative accounts with from 1 per cent. cover and upwards, without any further risk or liability to their clients whatever.

THUS, £5 commands £500 Stock; £10, £1,000 Stock; £50, £5,000 Stock;
And so on to any amount.

In the transaction of speculative business Messrs. C., S. & Co. make no charge for commission or brokerage whatever unless their client makes a profit, when they take 5 per cent. of the profit made as their remuneration.

All transactions advised by wire as soon as completed. Monthly Circulars and Mining Reports post-free on application.

COLES, STEWART & CO., St. Stephen's Chambers, LONDON, E.C.

architect on the usual terms. Plaintiff found that as soon as Mr. Peters got one scheme he wanted another. First, the ground was prepared for six cottages, then it was altered and arranged for seven; but when the advertisements for the cottages appeared it transpired that there were to be nine cottages. Only two tenders were sent—one for 1,266*l.* and the other for 1,300*l.* Mr. Peters thought that too much, and suggested that the contract should be cut down, and that plaintiff should take it himself. Nine cottages at 1,200*l.* would come to about 140*l.* apiece, but the contract was brought down to 117*l.* each. An agreement was drawn up, which the architects and surveyors employed said they could not construe. By that agreement plaintiff undertook to put up nine cottages, "as per plans and specifications, on the site of the New Inn, lessening the cost of the materials, &c., consistently with necessary requirements," for the sum of 1,050*l.* Three days afterwards Mr. Sivell set to work, and on October 12 he commenced building the nine cottages. Mr. Peters took great interest in the work, and suggested first one alteration and then another, and at last was told that if he did all this he would entirely break the contract. The defendant had pressed bricks substituted for common ones, had hollow walls built to keep out the wet, had some of the rooms enlarged, and in two cases had additional rooms built. In the autumn of 1884 defendant also told Mr. Sivell to buy Kenwood's Cottages and rebuild them. About this time Mr. Peters had the misfortune to lose his wife, and he thought it would be a nice thing to erect a memorial tower to her among these cottages. Mr. Sivell gave him a rough estimate of the cost, which he put at 350*l.* He was told to go on with the tower and four cottages, but Mr. Peters subsequently came down, said the cottages were too cramped, and that instead of four cottages there should be three. He subsequently added a clock and clock chamber to the tower, and after that he added a look-out room for the fishermen. Mr. Peters went abroad for some time, and on his return home Mr. Sivell drew up a rough statement of accounts, and put down the sums originally agreed upon, but he did not put down any extras, as the work was still going on. Afterwards they could not agree as to the extras. Mr. Peters offered 200*l.*, which was refused by the plaintiff, who, however, accepted 150*l.* on account, and expressed himself ready to abide by the decision of any two surveyors and an umpire. The plaintiff had actually paid 2,335*l.* on account of these buildings, and had only been paid 2,000*l.* He claimed 2,928*l.* 14*s.* 10*d.*, leaving a balance of 928*l.* 14*s.* 10*d.* unpaid. Alternatively he claimed, if the work was not to be valued according to measurement and value, but according to various extras, 475*l.* 15*s.* 7*d.*

Mr. Justice Manisty said he thought it was hopeless to attempt the trial of such a case, and by his lordship's direction the jury were discharged, and the case was directed to go to arbitration, the costs to remain with the arbitrator.

MODEL OF JEDBURGH ABBEY.

THE model of Jedburgh Abbey by Mr. George Aitken has been now sent off to the International Exhibition, Edinburgh. Great care has been taken to make the model as perfect as possible in all its details, and the work has been successfully accomplished. Every portion of the old fabric has been faithfully reproduced, from the elegant clustered pillars and moulded arches of the nave, and the massive tower with its grotesque figures and decorated balustrade, to the broken walls and arches of the aisles, the dilapidated arcades, and the canopied niches, long since deprived of their sacred images.

THE MOSAIC WORKS OF MESSRS. BURKE & CO. IN PARIS.

ENGLISH visitors to Paris who can take an interest in an effort by a firm of their countrymen to gain a position in the French capital, and in a line where the competition is exacting, would do well to visit the workshops of Messrs. Burke & Co., the mosaic workers of Newman Street. They will be found at the corner of the Rue St.-Luc, which is quite close to the outer boulevard, and within a few minutes' walk of the Northern railway station. That part of Paris, forming as it does the district of La Chapelle, was at one time supposed to be outside the area set forth for a tourist's inspection; but the city has grown since then, and the guide-books have to be more comprehensive. Bædeker, for example, recommends a visit to the church of St.-Bernard, erected in 1861 from the designs of M. Magne, which is a good example of modern French Gothic. It stands opposite the gate of Messrs. Burke's works. The district occupies the east side of the hill of Montmartre, and the character of the ground is evident from the way in which the streets are laid out. But the place is easily accessible from all parts of Paris, and one of the lines of tramway runs quite

close. A visitor will find much to compensate him for the journey, even if his hotel should be at the left side of the river.

The mosaic works are capacious and, it is needless to say, are well lighted. In the basement is the machinery which is employed for sawing marble slabs into thin sheets, which are afterwards cut up into tesseræ for pavements. A good deal of care has to be taken with this operation. It is necessary to have several cutters at work simultaneously, and the degree of force and motion must be regulated according to the quality of the material. The slightest jarring might destroy a valuable slab. The machine which we saw got through the work apparently with as much ease as a steam loom, although the marble was exceedingly close grained and hard.

The material obtained in this way is only intended for pavements or other work which has to be produced cheaply, and in which no attempt is made to produce a definite pattern. But so long as the marble employed is of good quality, pavements of the kind are not only well adapted for wear, but have an agreeable appearance. It is supposed very often that mosaic of this class is made up of mere chips of marble which are left from more important work. Some of the old Italian pavements have been produced in that way, and they must have needed an enormous amount of rubbing-down before a flat face was secured. In Messrs. Burke's pavements of the simplest class there is nothing that can be called *débris*. The fragments of marble are, as we have said, obtained from large blocks, and, from the uniformity of thickness which is a consequence of machine-cutting, there is not only a level surface, but, from the perfection of the bedding, there is a longer duration than is possible with any other mode of production.

It is not necessary to describe the process of forming a mosaic. There are, as in weaving, different methods of procedure, but they all resolve themselves into one. A coloured drawing has to be made, and the mosaicist, by means of infinite patience, has to imitate it by adding one little tessera to another. It is not a kind of work on which expedition is desirable. If men work in a hurry, as has to be done whenever a very low price is accepted, there must be either a want of delicacy in the graduation of the tones or the blocks will not be put well together. We have seen mosaics of this class which are no more than caricatures of the art. It should also be remembered that in mosaic there is at all times a difficulty in insuring an approach to the contours that are easily produced by the brush or pencil. It is only practicable when skilful hands are employed and sufficient time is given to them for fitting the cubes. The glory of mosaic is that it can withstand the influences of time better than sculpture and far better than painting; but if the mosaicist is compelled to drop a certain number of tesseræ every day, in order to gain a living, he cannot afford to think much about the endurance of what he is doing. Contractors and others may say that mosaic bears a resemblance to type-setting, and that a compositor works under similar conditions of relation between wages and the quantity of separate types that are taken up and set down in a day. But the compositor is not engaged in making a picture which depends for success on the harmony between the multitude of particles.

The Italians employed in Messrs. Burke's ateliers appear to be all picked artists, and when we visited their rooms we can testify that their work in all its stages was marked by very great care. Mosaics for churches, public and private buildings were in course of production, and we could observe no sign of the slip-shod manner of production which is more out of place with mosaic than with any of the industrial arts. The director of the works in the Rue St.-Luc is a master of the craft, who is eager to produce mosaics that will be worthy of the name.

Under the circumstances, it is certain that Messrs. Burke & Co. will attract a still larger amount of patronage from French architects than they have gained. Their work will sustain all the tests that are necessary. It has accuracy, fine colour, and durability. Mosaic is often used as a means of decoration throughout France, and Messrs. Burke, from the quality of their work, must overcome any prejudice which might exist against foreign contractors. The enterprise which is seen in the establishment of works of the kind is entitled to the commendation of everybody in England; for if British trade is to regain its position it will be only by showing readiness to compete with rivals on their own ground.

Messrs. Burke were instructed by the architect for the Palace of Justice, at Brussels, to submit a design for a mosaic panel to be placed over the entrance door to the Tribunal of Commerce. The design was accepted, and the full-size cartoon was prepared by an English artist, which says much for the appreciation by foreigners of artistic progress in England. The mosaic was prepared at Messrs. Burke's factory in Paris, and fixed by their Italian workmen. In the factory at Paris there are only Italians. The manager is an Italian, yet the owner is an Englishman, and the locale France.

THE BRITISH DINNER COMPANY, LIMITED.

Incorporated under the Companies' Acts, 1862 to 1883, whereby the liability of each Shareholder is limited to the amount of his Share.

CAPITAL £25,000, divided into 25,000 Shares of £1 each,

Payable 2s. per Share on Application and 8s. per Share on Allotment, after which further calls will be made as required for the development of the business. It shall be optional, however, for Shareholders to pay up in full at a reduction of 5 per cent. Where no Allotment is made the application money will be returned in full.

BANKERS.—The London and County Bank, Limited, 325 High Holborn, London, W.C.

SOLICITOR.—ARTHUR TOOVEY, Esq., 18 Orchard Street, Portman Square, London, W.
GENERAL MANAGER.—Mr. EMANUEL DURET.
AUDITOR.—HENRY NORMAN HOLE, Esq., Bond Court House, Walbrook, London, E.C.
SECRETARY.—EUSTACE A. S. HOUNSELL.
TEMPORARY OFFICES.—15, 16, 17 The Outer Temple; 222-5 Strand, London, W.C. (opposite the Royal Courts of Justice).

This Company has been formed for the purpose of establishing Depôts over the Metropolis and elsewhere to supply good, wholesome, nutritious, well-cooked food suitable for working classes and others of small means at the lowest possible cost.

On the Continent and in Scotland there are numerous establishments where substantial dinners, at low prices, are provided for the people, yielding handsome dividends to the Shareholders.

Good meat dinners, with portions of potatoes, and a second vegetable—turnips, cabbage, or other seasonable kind—and a first course of either good soup or fish and bread, can be supplied for sixpence, and yield a profit equal to 25 per cent., which is proved to demonstration in Glasgow, where similar food is supplied with a good profit at even a lower price.

It is a well-known fact that New Zealand mutton and American beef (both of first quality) can be bought on the London markets at prices ranging from 4½*d.* to 5*d.*, and 5*d.* to 5½*d.* per lb. respectively, both of which are served daily in first-class London restaurants as "prime Scotch or English meat."

All the food will be of good quality, and carefully prepared, so that the nutritive properties are retained. Families will find this the best opportunity for obtaining ready-cooked dinners at less cost than they could be prepared at home.

The Directors have secured the services for five years of Mr. Emanuel Duret as General Manager at a nominal salary and commission, *pro rata*, after the Shareholders *first receive* dividends of not less than 5 per cent. Mr. Duret has had great and varied experience, and has made the matter of "cheap food for the million" his special study for over a quarter of a century, practically and theoretically, both on the Continent and in England. He has had the greatest and most varied experiences as Manager and Caterer. He is thoroughly conversant with the management of large establishments, and well acquainted with the best markets for meat, fish, provisions, &c.

1. He managed the St. James's Hall Restaurant, Regent Street and Piccadilly.
2. Was Contractor and Caterer to the Admiralty.
3. The Directors of the North-Eastern Railway Company selected him out of about 300 candidates, and appointed him Manager of their Hotel and Refreshment Rooms at York, which he opened and conducted to the entire satisfaction of the Board.
4. He was Proprietor and Manager of the Manor House Hotel at Leamington, and holds the highest and most complimentary testimonials from those by whom he was employed, as well as from the Speaker of the House of Commons, the Earl of Camperdown, and many other distinguished noblemen and gentlemen, testifying in the strongest terms to his great ability, courtesy, and efficiency as a public caterer.

The philanthropist and economist combine when placing a cheap, nutritious, palatable meal within the reach of the working-man at a fair profit. It has been statistically proved that a working-man spends about

60	per cent.	of his wages in	Food.
15	,,	,,	Rent.
10 to 12	,,	,,	Clothing.
13 to 15	,,	,,	Gas, coals, rates, taxes, education, &c.

This enormous expenditure of 60 per cent. shows that food ranks first amongst the necessaries of life, and that the claims for food assert themselves before all others; therefore the question of a thorough food reform is of much more importance than the question of housing, and deserves the greatest attention on the part of the public. If a working man were provided with a house, rent free, the effect would only be a saving of 15 per cent., but a rational food reform would save him 30 per cent., or twice as much as the whole of his house rent.

It is well known that one of the most successful private commercial undertakings in London is Lockhart's Cocoa Rooms, now established all over London and throughout the large provincial cities and towns. The trade, however, is confined principally to tea, coffee, cocoa, cakes, &c.

The Aerated Bread Company (Limited) also supply tea, coffee, cocoa, bread, butter, cakes, eggs, and some cold or preserved meats, and, like Lockhart's, they have, and are continually opening depôts all over the metropolis, paying steadily increasing dividends, and the shares consequently are at very high premiums.

The British Dinner Company (Limited) intends to supply not only what can be obtained at the before-mentioned establishments, but also what a working man requires most—namely, a substantial dinner, consisting of a basin of good soup or fish, a plate of meat, and a portion of both potatoes and another vegetable and bread, for sixpence, well prepared; a comfortable room, tables scrupulously clean, with good and prompt attendance.

This Company will buy meat, vegetables, tea, coffee, and all other provisions in large quantities for cash, obtaining them at very much lower prices than private individuals. It is contemplated to buy provisions, potatoes, cabbages, turnips, onions, and eggs direct from the farmers, thus saving all intermediate profits.

The only contract that has been entered into is made between the Temple Syndicate and Mr. Eustace A. S. Hounsell as Trustee for and on behalf of the Company, whereby the Syndicate contracts to pay all Rent of Offices, Salaries of Secretaries and Clerks, Printing, Stationery, Postages, Advertising, and all Costs and Expenses incidental to the registration, formation and floating of the Company generally up to the date of allotment of Shares for the sum of £750 and 750 fully paid Shares in the Company.

Prospectuses and Forms of Application may be had of the Bankers, or at the offices of the Company. The agreement above referred to and the Memorandum and Articles of Association may be seen at the offices of the Company.

Applications for Shares may be made to the Bankers, or to the Secretary. All cheques should be crossed with the name of the Company's Bankers, and made payable to the Secretary.

MESSRS. DOULTON'S EXHIBITS.

There is so much of Indian and Colonial work to be seen at South Kensington, visitors are likely to overlook what has been done by Messrs. Doulton & Co. towards the embellishment of the building. Their work is well deserving of attention from its beauty and novelty.

The whole of the west wall opposite the turnstiles from Exhibition Road into the main entrance hall is faced with slabs of terra-cotta painted in the impasto process recently introduced by the firm. This process may be described as a "new departure" in ceramic decoration, the paintings being executed in coloured clays, which become incorporated with the body of the ware in the subsequent firing and glazing. The joints in these panels are made to follow the outlines or leading lines of the design, as in stained glass; and as pieces of large area can be safely used, the total number of joints in a panel of any given size is considerably reduced. Not only, therefore, is the labour of fixing less than in ordinary tile panels, but the unsightly straight jointing is altogether avoided. As compared to the usual style of painting on tiles, the impasto painting is much richer in effect, and admits of much bolder treatment and broader methods of workmanship than have hitherto been possible in permanent wall decoration.

The subjects of the panels are as follows:—Of the three lunettes (each nearly 7 feet high by 10 feet wide) above the archways, the left hand one is typical of India's native art, and represents an Indian potter working at his wheel, while a native woman is decorating the ware. The centre panel is typical of Great Britain, as represented in her manufacturing industries; the figures are those of an engineer and blacksmith. The right-hand lunette represents Australasia, as typified by a gold-miner and a farmer. The large panels on either side are typical of East and West, in allusion to the wide extent of the British Empire—the East as seen in its gorgeously plumaged peacocks and wealth of floral beauty, its marble palaces and temples glistening beneath the brilliant sky, and the West as showing in sterner aspect a family of eagles in their eyrie on some mountain peak. These two panels are each over 16 feet high by 7½ feet wide, and are probably the largest paintings ever yet executed in ceramic ware.

Between the archways are pilaster panels of conventional ornament, and above and below a frieze and dado all in coloured terra-cotta. The decorations of this wall were designed by Mr. John Eyre.

In the garden adjoining the Durbar Hall, and not far from Mr. Rowland Ward's trophy, is the façade (nearly 200 feet long) of the Indian Tea House. The construction is of wood, into which is framed a series of terra-cotta panels painted in rich tones of permanent coloured glazes. The models for the panels were executed by the Indian carvers, Jumma and Mohammed Baksh, under the superintendence of Mr. C. Purdon Clarke, from whose designs the Indian Palace has been erected. Let into the floor of the Durbar Hall is a fountain of glazed terra-cotta, a facsimile both in colour and design of an old fountain in the Mogul style.

In the West India Court is a fountain in Doulton ware, designed by Mr. George Tinworth, which is generally surrounded by a crowd, and it is to be feared is not recognised as the production of a London firm. This fountain was first exhibited at the Paris Exhibition of 1878. The various subjects which compose the pyramidal column of this work are selected from Scripture history, and have reference to water either in its natural aspects or artificial uses.

Messrs. Doulton & Co. have also supplied the whole of the sanitary and lavatory arrangements and fittings to H.R.H. the Prince of Wales's apartments, to the board-room, to the offices throughout the exhibition buildings, and for the use of the native Indian workmen engaged in the bazaar; also the fireplaces and mantelpieces in glazed pottery for the committee-room, secretary's office, and various other offices, and the patent silicon-ware treads to the nosings of stone steps at main entrance in central gallery and flight of steps adjoining Old London, &c. Some of these silicon treads have been in position during the former exhibitions on this spot, and notwithstanding the enormous traffic, show no signs of wear.

Messrs. Doulton & Co. have also contributed to the success of the other exhibitions which are now open in the provinces. In the grand hall of Edinburgh they have a large exhibit of their art pottery in its various forms, and in the central court they have a collection of pottery for domestic and manufacturing purposes. In Liverpool the Doulton trophy is placed under the dome in the central avenue. It consists of a pavilion about 30 feet by 30 feet, with four porches, surmounted by an octagonal dome of glazed tiles, with large ball of glazed terra-cotta above all, the lower portion being ornamented with Doulton-ware arches, columns, balustrades, &c. In the interiors are represented in four distinct sections, drawing-room, dining-room, boudoir, and library, each being fitted with appropriate fireplaces and

THE IMPERIAL HAND GRENADE
FIRE EXTINGUISHER.

Their Royal Highnesses the Prince and Princess of Wales and Suite witnessed a Practical Experiment in Fire Extinguishment at Norwich, during the Royal Agricultural Society Show, July 14, 1886.

"The fire extinguisher displayed in presence of the Royal party and a large company was the Imperial Hand Grenade, and the trial was conducted in a meadow next Trowse Church, under the direction of Mr. T. H. Tilton and Mr. Alfred Barnard (of Barnard, Bishop & Barnards, who are wholesale agents for the East of England). The experiments were a thorough success. A wooden chimney 14 feet in height was ignited, and the flames shot up quite 10 feet beyond; a large structure representing the section of a house and a smaller structure were also set on fire, and all were instantaneously extinguished by four grenades. The Prince and Princess both expressed their surprise and pleasure at the efficacy of this novelty in quickly putting out fire, and ordered that several might be sent on to Sandringham. The Royal party then moved off amid the cheers of the crowd."—*The Norfolk Chronicle and Norwich Gazette*, July 15, 1886.

Publishers, GILBERT WOOD & CO., 175 Strand, London, W.C.

stoves, all of pottery, and on slow-combustion principles; on the walls are landscapes in tiles, and around are placed various ornaments for mantelpieces, cabinets, &c., in the choicest art wares. An entirely new feature is the painted glass introduced in the entrances to the pavilion, consisting of designs in floral and other decorations, with appropriate borders. Most of them are done on cathedral glass by a new process patented by Messrs. Doulton, and are most effective both in colouring and design, while from the simple manner of manufacture really good artistic designs are very reasonably produced. The exterior of the trophy is ornamented with some excellent tile panels. Those on the south side represent Stephenson and Watt, and those on the north Liverpool past and present, the former being the paddle steamship, the *Royal William*, the first steam vessel that sailed from the Mersey for New York, about fifty years ago, and the latter, the *Umbria*, the last new screw Cunard liner. The trophy, with the stands at the angles, was designed by Mr. A. E. Pearce. The Doulton screen, which is 80 feet long and 25 feet high, is also in the exhibition.

At Folkestone is exhibited the dramatic panel modelled by Mr. Tinworth, called *The Preparation for the Crucifixion*, which is a marvel for design and execution.

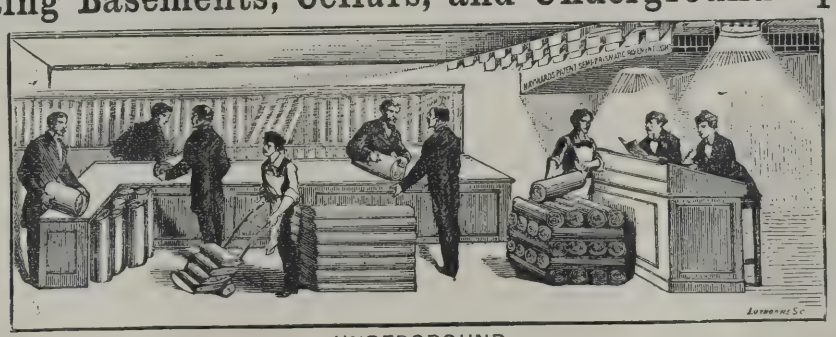
MONKS' PARK STONE.

THE following letter on the litigation in respect of Monks' Park stone arrived too late for insertion last week :—

SIR,—The notice of this case in your last issue was, I presume, communicated to you by the defendants or their agents, and, as the result of the hearing before Vice-Chancellor Bacon in July last was at the time largely circulated amongst architects and builders by means of slips sent out by the defendants, it seems hardly necessary for them now to publish in newspapers a revised edition of the Vice-Chancellor's judgment; but as they have done so, I may in fairness ask you to insert in your widely-circulated newspaper the following brief statement.

In the year 1877 I took a lease, granted by Sir G. Goldney, Bart., of thirty-six acres of stone lying under the park in which Monks' House, in the parish of Corsham, is situated, and found valuable stone. I sold the stone to a large extent under the name of Monks' Park stone, and in the year 1882 registered a trade-mark under the Act of 1875, with the name "Monks' Park" as the description of stone from my particular quarry, thinking thereby to prevent the use of this name by any other quarry-master who might after that date raise stone from the other parts of the Monks' Park estate.

In April, 1883, I for the first time saw by an advertisement in the *Stonemason* that the defendants were offering Monks' Park stone for sale. I remonstrated with them against the use by them of the term "Monks' Park" as a description of their stone, and they ceased to advertise it in newspapers under that or any similar name, but as they allege continued to advertise it by the circulation in the trade of slips and pamphlets under the name of "Pictor's Monks' Park."



This "slip" and "pamphlet" advertisement the learned Vice-Chancellor was certainly convinced, at the hearing of the motion, had come to my knowledge at the time or immediately after the ceasing of the defendants' advertisement in the *Stonemason*; but, as a matter of fact, I had no knowledge of the defendants' "slip" advertisement until shortly before I applied to the Vice-Chancellor; and as the defendants in their defence partly relied upon laches on my part for not having followed up my remonstrance in 1883 against their use of the name, probably, had I been in possession of this valuable information, the result to the defendants might have been different.

The defendants' advertisement in 1883 was concurrent with their opening a quarry on the Monks' Park Estate—not under the park in which Monks' House is situated, but under a farm known locally as "Boyd's Farm"—and the sale by them of the stone from that quarry under the name of "Pictor's Monks' Park stone."

I took proceedings against defendants for the purposes set out in their revised edition, with the result of the injunction being refused. The question as to documents merely arose out of the form of defendants' affidavit, and had nothing to do with the main question between me and the defendants. If it was proved, as stated in the "revised edition" of the case, that the stone from my quarry in "Monks' Park" and the stone from defendants' quarry at "Boyd's" was of the same kind and quality, being of the same bed, I can only ask architects and builders, before they determine this question, not to rely implicitly upon the opinion of Vice-Chancellor Bacon as to the quality of the respective stones, but to inspect the two quarries and judge for themselves before they select Bath stone to be used in valuable buildings.

I need hardly assure you that I will give every facility in my

power towards an inspection of my Monks' Park quarry at Corsham.—I am, Sir, your obedient servant,

Bath, July 28, 1886. I. SUMSION.

THE CONVALESCENT HOSPITAL, DARENTH.

A MEETING of the Metropolitan Asylums Board, the last prior to the vacation, was held on Saturday.

Captain Douglas Galton, for the general purposes committee, brought up a report upon the subject of the establishment of a hospital for convalescing smallpox patients at Darenth. The question under discussion was whether the provision to be made on the Darenth site for future epidemics should be in the form of huts or brick buildings, this question having been raised by the Local Government Board. The committee remarked that the central authority did not give an authoritative decision on the question they had raised, but confined themselves to suggesting certain points for the consideration of the Asylums Board. They based these suggestions upon the assumption that the construction of smallpox hospitals, and the number of patients whom it might be desirable to treat under one administration, were so far undecided as to render it inexpedient to expend a larger sum than was absolutely necessary on structures which further experience might show were not wholly suited to their purpose. The committee concurred in this view, but considered that the plan they were proceeding on did limit the expenditure, and was the most economical they could adopt, having regard to the efficiency of the service and to the necessity of providing for recurring epidemics. The committee stated that for various considerations, as well as on financial grounds, they were decidedly of opinion that it was not expedient, in the interests either of the patients or of the ratepayers, to depart from the plans which had been adopted after most careful consideration, both on the part of the managers and on the part of the Local Government Board, and which received the approval of that Board.

Captain Douglas Galton proposed the adoption of the recommendations. He maintained that brick buildings should be erected for the hospital on several grounds, the chief of them being that wooden huts presented a great danger from liability to fire; that they were more difficult to keep at an even and a good temperature, and were liable to become saturated with infection, while they would involve a considerable proportion of the sum of 116,000*l.* required for the building of brick huts. He concluded by moving, "That a copy of so much of the committee's report as relates to the Gore Farm Hospital be transmitted to the Local Government Board, in reply to their letter of the 4th ultimo, with an intimation that the managers concur in the various conclusions at which the Gore Farm Committee and the General Purposes Committee have arrived, and with a request that the Local Government Board will at once issue the order promised in their letter of July 12, 1884, authorising the managers to expend and raise on loan the sum of 116,000*l.*, being the amount which it is estimated will be required for the erection of the proposed Hospital for Convalescing Smallpox Patients on the managers' estate at Darenth."

Mr. Davis moved that the consideration of the entire question should be deferred for twelve months.

The Board rejected a proposal to adjourn the discussion, and eventually, upon a division, the managers rejected the amendment by 26 to 13, and the recommendations of the committee were agreed to.

THE LIVERPOOL AND BIRKENHEAD DOCKS AND WAREHOUSES.

AT the recent meeting of the Institution of Naval Architects a paper was read by Mr. G. F. Lyster, engineer to the Mersey Docks Estate, in the course of which he gave the subjoined description of the works lately executed:—

The last important Works Act was that obtained in 1873, at which time, owing to the rapid increase in the size and tonnage of steamships, it had become necessary that special dock provision should be made to meet the requirements of the port in that direction. Very comprehensive systems of docks were then designed to meet these pressing wants, and Parliamentary powers were obtained to carry out the necessary works, which consisted of the development of the northern and southern ends of the estate, previously acquired and reclaimed from the foreshore for the purpose. The Parliamentary estimate for these schemes was 4,100,000*l.* The northern development, known as the "North-end scheme," comprised the extension of the Canada Basin and the lowering of the level of its floor, the formation of the Langton Half-tide Dock or entering vestibule into the main group, two graving docks, the Langton Branch Dock, the Alexandra Dock and its three branches, and the Hornby Dock. The total area of the wet docks provided by this exten-

WILLIAMS & CO.,
Lillie Bridge Works, London, S.W.,
MANUFACTURERS OF PATENT
METAL CASEMENTS
AND
LEADED WINDOWS.
Our Patent Steel "SIMPLEX" Casements have the following advantages over any other Casements in the market:—
They are thoroughly weathertight.
They can be made to open inwards or outwards, hung at the sides, or head, or sill, and in all cases the PLANE OF GLASS and the SIGHT LINE are the same.
They will not SAG, or TWIST, or JAM.
The Glass being secured by metal fillets the ragged appearance of putty is avoided.
The face being moulded has a more pleasing appearance than the ordinary uncouth finish.
By the use of these Casements all difficulties of window-cleaning are overcome.
The Patent "Cottage" Casement is made for such positions where plane of glass and thorough weathertightness are not absolute requisites, and where the extent of finish is not necessary.
Prices and particulars will be gladly furnished on receipt of inquiry.

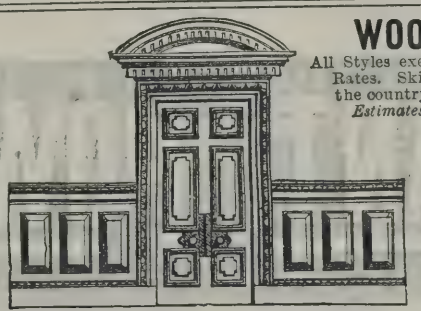
sion is 83 acres, and quayage 23,700 feet, while the length of floor of the two Langton Graving Docks is 1,900 feet. The estimate for this important section of the Parliamentary works amounted to 2,691,360*l.*, within which sum they have been carried out to completion. The greater part of the additional dock accommodation in this position was completed in 1881, and was opened for use by their Royal Highnesses the Prince and Princess of Wales on September 8 of that year. The works at the south end of the dock estate authorised by the Act of 1873, comprised the enlargement of the Herculaneum Dock, which had been built in 1868 with a special view to future extension, and the formation of a chain of docks to the northward terminating at the Brunswick Docks, and forming a complete development of the whole of the available estate in this position. The Herculaneum Dock and graving docks, and the Harrington Dock immediately to the north of the same, are finished and in full use, and the remaining docks of the group are rapidly approaching completion. The Parliamentary estimate for the South-end scheme was 1,408,640*l.*, within which they will be carried out.

In addition to the value accruing to the trade of the port by such a large and extensive increase of docks in a district of the city hitherto unprovided with this class of accommodation, it will have the further advantage of bringing some of the older docks into more prominent use than hitherto. I allude to that important group, including the Brunswick and other docks immediately to the north of it, the entrances to which are impeded by the Pluckington Bank, which extends for over a mile in length immediately in front of that portion of the estate, and forms a serious obstruction to its free working. The new South-end group will to a great extent neutralise this inconvenience by admitting vessels to enter the old dock through the new group by way of the river entrances at the Herculaneum. The total water area of the new docks at the north and south ends of the estate constructed under the Act of 1873 is 111 acres, equal to nearly half the acreage of the docks in existence previous to the date referred to. The total area of the existing dock estate at Liverpool is 1,078 acres, and the entire of this space is developed into basins, docks, quays, and premises worked in connection therewith. There are in all at Liverpool sixty docks and basins of the ordinary type, having a total water area of 368 acres, and twenty-five miles of quay berthing.



It now remains for me briefly to refer to the Birkenhead estate, which now forms an integral portion of the Liverpool estate, and is worked in complete unison therewith. The docks of which it consists are constructed on the site of a tidal creek called Wallasey Pool, which extended inland from the left bank of the river for about two miles, and which was formerly the outlet of the drainage of the lowlands of the Leasowes lying between the Dee and the Mersey. The original design for the undertaking was by the well-known and eminent engineer, the late Mr. James Meadows Rendel, F.R.S., who partially carried out the work. When in the hands of the projectors it mainly consisted of two large docks, called the East and West Float, with an aggregate area of about 120 acres, occupying a large proportion of the pool. Considerable alterations, however, were made in the design by the late Mr. John Bernard Hartley, when the docks became the property of the Board, though the East and West Floats, and also a great low-water basin and river entrances leading into smaller docks, still formed the leading features of his scheme. The connection between the docks and the river is by means of an extensive chain of docks, also a capacious half-tide dock with several locks, the sills of which are laid at a similar depth to those described for the Liverpool North-end scheme, and maintained by an extensive sluicing arrangement of a somewhat similar character. The total area of docks at Birkenhead is 164½ acres, with 9½ miles of quayage. There are also three graving docks at Birkenhead, opening from the West Float and capable of dealing with the largest class of vessels, their aggregate length being 2,430 feet. The several quays of the Birkenhead docks are surrounded by railways which are connected with the London and North-Western, Great Western, and Cheshire Lines systems, each of which have large stations upon the dock quays. On the acquisition by the Dock Board of the Birkenhead estate it became necessary to establish a means of interchanging the traffic between the two estates, and with this object in view extensive landing-stages were established by the Board on both sides of the river, alongside of which vessels of considerable size lie, on the lowest state of the tide. These stages are in communication with the quays of the river wall by means of hinged girder bridges for foot passengers and pontoon roadways for wheel traffic. The length of the Liverpool stage is 2,060 feet by a minimum width of 80 feet, and that at Woodside on the Cheshire bank of the river is 800 feet long and 80 feet wide. The passenger boats which ply between the several ferry stations on the river make use of these stages free of charge, and it is computed that no less than twenty-two million passengers annually cross to and fro.

VOLUME XXXV. OF THE ARCHITECT.
Handsomely bound in Cloth, Gilt Lettered. Price 12s. 6d.—Office: 175 Strand, London, W.C.

The sheds in connection with the newer docks more especially are of a very commodious description, occupying generally a width of quay of 100 feet. The total area of sheds on the quays of the docks at Liverpool and Birkenhead is 104½ acres, exclusive of the warehouses. Very extensive blocks of warehouses were erected about twenty years ago for the accommodation of the grain trade at the Waterloo Dock, Liverpool, and the Great Float, Birkenhead. The aggregate floor area of both sets of warehouses is 23 acres, and they are equipped with elaborate machinery for facilitating the rapid discharge of ships, and for housing and delivering the grain into railway waggons, carts, or lighters. A main feature is the transfer of grain on bands, an arrangement which at the time these warehouses were erected was entirely novel, but which has since become the recognised means of transmitting grain not only in warehouses, but from ship to quay and in other situations. Other extensive warehouses for ordinary goods, also a special warehouse for the storage and manipulation of tobacco, in which there is a very large trade, have been erected in various positions along the estate. The total floor area of the warehouses on the dock estate amounts to 93 acres. The coal trade of the port is provided for at the Bramley-Moore and Wellington Docks, Liverpool, and at the Great Float, Birkenhead. At the former position an extensive arrangement of coal sidings has been provided at a level above that of the dock quays and having connection over the streets with the Lancashire and Yorkshire Railway, which is in direct communication with the Lancashire coalfields. This arrangement gives great facilities for this class of trade, as is evidenced by the fact that above 500,000 tons of coal are here annually dealt with. On the south quay of the Great Float, Birkenhead, an extensive group of sidings and coal hoists, working in connection with the coalfields in North and South Wales, have been constructed, and add materially to the trade of these docks, an average of over 1½ million tons of coal being annually brought into Birkenhead for export, and for the use of the steamships. The timber trade has its chief centre in the Canada and Brocklebank Docks, on the quays of which extensive yards are in the occupation of the trade. The import of live cattle from abroad is a trade which has of late years assumed large proportions, and very extensive lairages, together with the necessary slaughter-houses and other adjuncts, have been provided both at Liverpool and Birkenhead. The area appropriated to this purpose at Liverpool is two acres, and at Birkenhead sixteen acres. The northern part of the Woodside Stage, and the whole of the Wallasey Stage, 350 feet by 70 feet, are made use of for landing cattle, heavy boats being able to come alongside at all states of the tide. The petroleum trade becomes more and more important, and in laying out the quays of the southernmost dock (the Herculaneum), very secure petroleum stores were provided by excavations in the face of the rock on the east side of the dock. These stores and others on the north quay of the Great Float, Birkenhead, are now in full working order. The gross total area of the estate on both sides of the river amounts to 1,583¾ acres. This is subdivided into 532¾ acres of water space in the form of docks, half-tide docks, and basins, which are surrounded by thirty-four miles of quays, also sheds and warehouses having an aggregate floor area of 181½ acres, the remainder being laid out in streets and open quays, also in timber yards, shipbuilding yards, and other business premises necessary for the working of the port, with a small residue of partly undeveloped land. The total graving dock accommodation is comprised in twenty-four docks with an aggregate length of floor of 14,920 feet. The total number of ships which entered the port and paid tonnage rates in the year ending July 1, 1885, was 21,529, having a net tonnage of 8,571,454 tons. In this figure the capacity in or out only is represented, not both. The total revenue of the estate received from all sources during the same period was about 1½ millions sterling. The affairs of the dock trust are administered by a body named the Mersey Docks and Harbour Board, with a number of members fixed by Act of Parliament at twenty-eight, twenty-four of whom are elected by the dock ratepayers, the remaining four being nominee members appointed by the Government.

IMPROVEMENT OF THE LIFFEY.

THE improvements undertaken by the Dublin Port and Docks Board are making steady progress. The object is to give a uniform depth of 26 feet of water at low tide to vessels frequenting that side of the Liffey from the Ringsend Dock up to Butt Bridge—a stretch of dock on which vessels drawing not more than 6 feet have been left high and dry at low water for many a year past. Up to Lime Street the heaviest vessels can now come alongside the wharves, and in the course of another twelvemonths the whole line of southern quays from Ringsend to Butt Bridge will be as available for heavy shipping as is the deepest portion of the northern side.

BRADSHAW'S LIMMER ASPHALTE

Messrs. BRADSHAW & CO., being Sole Agents in the United Kingdom for, and possessing proprietary rights in, the Freehold Mines of the German Asphalte Company (of which Mr. C. W. Bradshaw is also a Director), situated at Limmer, near Hanover, and Vorwohle, Brunswick, possess special facilities for reliable and prompt delivery of their celebrated "LIMMER ASPHALTE" at low rates, either for sale in its natural state or ready for laying by their own workmen in any part of the United Kingdom. EACH BLOCK supplied from these Mines, besides bearing the impress of the Company, is stamped with the words "BRADSHAW & CO." The attention of Architects, Engineers, &c., is particularly called to the fact that the "LIMMER ASPHALTE" is especially suitable for use in the construction of Reservoirs, Roofs, &c., where water-tightness is extremely essential. For such purposes **Over 2,000,000 (Two Millions) of Square Feet of "Limmer Asphalte"** have been executed by Messrs. BRADSHAW & CO.; while for Paving purposes **Over 50 Miles of "Limmer Asphalte" Footways** have been laid by them in the LONDON DISTRICT ALONE. Messrs. BRADSHAW & CO. will be happy to forward Prices, Samples, and Testimonials, and give all information on application to :—

R. ADAMS,

17 BLACKMAN STREET & 7 GREAT DOVER STREET, LONDON, S.E.,

INVENTOR and PATENTEE of the

SAFETY WINDOW WITH REVERSIBLE SASHES

FOR INEXPENSIVE AND PERPETUAL CLEANLINESS,

Which has gained at the INTERNATIONAL HEALTH and SANITARY EXHIBITIONS

Two Gold, Four Silver, and Four Bronze Medals, and Sixteen Diplomas of Merit.

IMPORTANT NOTICE.

The Patentee has been advised by several of his friends to form a Company for the Manufacture of the above-mentioned Sashes in larger numbers, for the supply of the Trade and for the Home, Colonial, and Foreign Markets. Hitherto he has only supplied the Fittings, except under very special circumstances. He now proposes to manufacture the Sashes complete with Fittings.

Provisional Protection has just been granted for another Patent, whereby the Sashes will be greatly reduced in price, and, consequently, brought within the requirements of every Architect and Builder.

If any of the readers of this journal wish to receive further particulars or to take Shares in the proposed Company, they are requested to make early application to the Patentee, as it is expected that the larger number of the Shares will be privately subscribed.

Applications for Shares will be taken in the order in which they are received.

RIPLEY.—Aug. 31.—For Building Board School, Street Lane. Mr. J. R. Naylor, Architect, Old Bank Chambers, Irongate, Derby.

STANLEY, CROOK.—Aug. 18.—For Building Sunday Schools. Mr. Robert W. Thompson, Architect, 46 North Bondgate, Bishop Auckland.

Red or Fire Clay. Also the preparation of a Rich Blood Red Slip, which serves as a Coating for Red Bricks of inferior colour.—Address "BRICKS," "The Architect," London.

GRUNDY'S PATENT
WARM-AIR
VENTILATING FIRE GRATE.
The novelty, superiority, and advantage of this patent consist in the heating surface being greater than any other Fire-grate introduced to the public. It is very simple in construction, and is made in the form of a Stove, the back of which is semicircular in shape, with gills behind and smoke-nozzle on top, all cast in one piece. The same can be attached to any design of a Register or Stove front. It is very suitable for schools, class-rooms, waiting-rooms, hospitals, offices, dormitories, and dwelling-houses, from the cottage to the mansion. Design and specification post free on application.
TESTIMONIALS.
"9 Victoria Chambers, Westminster, S.W.: June 10, 1884.
"SIR,—I have much pleasure in testifying to the efficiency of your patent warm-air fire grate. It has been very successful, and given every satisfaction where I have used it. Yours, &c.,
"To Mr. Grundy. JAMES WEIR, F.R.I.B.A."
"6 John Street, Bedford Row, W.C.:
"December 16, 1885.
"DEAR SIR,—I have now had an opportunity of testing your patent grate, and am glad to be able to say that I am most agreeably disappointed, because, as you are aware, I was rather sceptical about its powers when you showed it to me; but now I can say it answers admirably, and heats abundantly my porch-conservatory.—I am, yours truly,
"R. S. LANDER, F.R.I.B.A.
"To Mr. John Grundy."
From James Garry, Esq., Architect, West Hartlepool, July 1884.
"DEAR SIR,—I have very great pleasure in stating that the first stove, or patent warm-air ventilating fire grate, adopted by me in school at Seaton, and a second in a Cocoa Palace, have given such satisfaction that I now order eleven to be inserted in New Upper Grade Schools in course of erection at West Hartlepool. They are the most economical, efficient, and easily managed stove at present before the public.—Mr. John Grundy."
From Hon. and Rev. G. G. C. Talbot, M.A., Withington, Cheltenham.
"DEAR SIR,—You will be gratified to hear that the school is completely warmed by your new grate. It is the most economical and efficient that I have ever seen.—Mr. John Grundy."
Society of Architects, Architectural and Building Trades Exhibition, 1885:—"5 Great James Street, Bedford Row, May 1.—The warm-air ventilating grate shown by Mr. John Grundy at Stand 75 Floral Hall, is an admirable contrivance for utilising the heat conducted through the back and sides of the stove, for warming schools and buildings by a supply of freshly warmed external air."
Apply to JOHN GRUNDY, 30 Duncan Terrace, City Road, London.—Works: TYLDESLEY, near Manchester.
Agent for Scotland, SEPTIMUS HARPUR SMITH, 1 Upper Gilmore Place, Edinburgh.

NOTICE OF REMOVAL.

BELLMAN'S PATENT GULLY.

This Gully possesses the following advantages:—

Receives and disconnects one Rain-water Pipe and Three Waste Pipes.

Avoids all Splashing. | **Forms Drain for Area or Surface.**

Ventilates the Pipes and Trap. | **Is easy of Access for Clearance.**

The ordinary P or S trap to be used in connection with Gully being in a separate piece, can be placed at any angle to meet the drain exactly, thus insuring a perfect joint, the Gully being fixed at right angles. This is a great advantage over other arrangements made with the trap in one piece.

The Holes for Rain-water Pipes are made both Circular and Square and of various sizes.

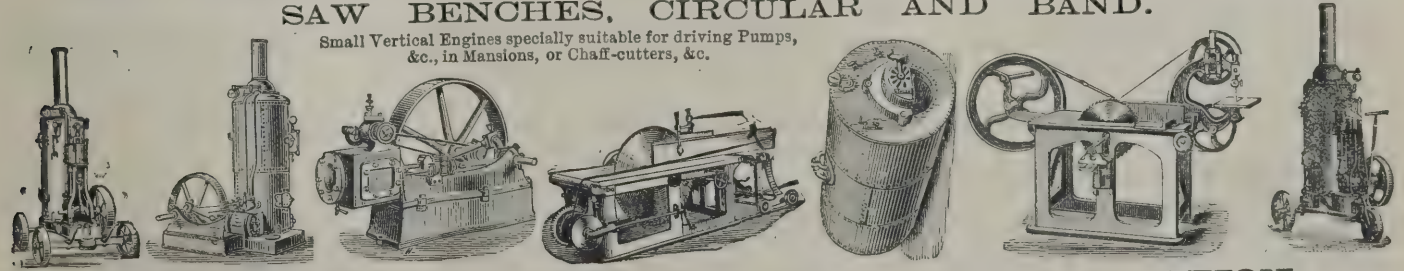
DESCRIPTIVE CIRCULAR ON APPLICATION.

THIS GULLY IS HIGHLY RECOMMENDED by Authorities on Sanitary Matters.

PRICE AT DEPOT:—EDWARD ST., DORSET SQUARE, N.W., 8s. 6d. each.

Also SINGLE GULLIES, for Sink Wastes only, price 3/9 each.

BELLMAN & IVEY,



(OFFICE ONLY) 37 PICCADILLY, LONDON, W.

E. S. HINDLEY, 11 QUEEN VICTORIA STREET.

VERTICAL STEAM ENGINES, PORTABLE OR FIXED. HORIZONTAL STEAM ENGINES } WITH OR WITHOUT VERTICAL BOILERS.

SAW BENCHES, CIRCULAR AND BAND.

Small Vertical Engines specially suitable for driving Pumps, &c., in Mansions, or Chaff-cutters, &c.

ILLUSTRATED CATALOGUES FREE ON APPLICATION.

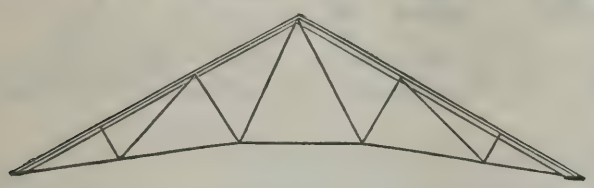
TRADE NOTES.

The Admiralty have just placed an order with the Woodhouse & Rawson Electric Manufacturing Company for over 7,000 switches, besides fusible plugs, brackets, and other articles.

Messrs. Archibald Smith & Stevens have received instructions to fix one of their patent hydraulic lifts at Mr. Pimm's warehouse, 197 Upper Thames Street. This lift will be of their latest "Reliance" type. The same firm have recently completed a second hydraulic lift for the Aërated Bread Company, Eastcheap House.



Amongst the most recent applications of the Æolus Waterspray system of heating, cooling, and ventilation, are:—The Churches of St. James, Hope, Lancashire; All Saints, Finchley Road; St. John the Evangelist, Ranmoor, Sheffield; Mr. Hill's House, Cyprus Road, Nottingham; Bible Christian Church, Plumstead; Mary Street Memorial Schools, Taunton; Christ Church, Blacklands, Hastings; Highgate Road Baptist Chapel; Heath Town Chapel, Wolverhampton; Castle Street Board Schools, Bristol, &c., &c.

Messrs. Francis & Co., Limited, cement and whiting manufacturers, have been registered as a joint-stock company, amalgamating at the same time the works of Empson, Holcombe & Co. and Francis, Donald & Johnstone, of Cliffe, both of which have hitherto been partially connected with them. The united businesses will in future be carried on under the style of Francis & Co., Limited. Shares are not offered to the public, as the whole of the interests will be retained by the present partners, their families, and friends.

Messrs. Broad & Co., of Paddington, send us a copy of the fifth edition of their illustrated catalogue. In it we find much useful information, more especially so with regard to the most recently approved methods of domestic sanitation. Messrs. Broad & Co. have shown a considerable amount of enterprise in introducing gully traps, sewer-gas interceptors, half channel pipes and bends made in white enamelled stoneware. Many of these articles are of special design, for which awards have been granted by the Health Exhibition, Sanitary Institute of Great Britain, Society of Architects, &c. This catalogue has been well arranged, and comprises a very large variety of sanitary specialities, ridge tiles, finials, bricks, &c., and forms a very useful book of reference.

The freehold building estate, known as Pleasantfield, near Brondesbury, was sold by auction by Mr. Richard J. Collier, of Finsbury Pavement, on Wednesday, for 16,000*l.* The estate is within about four miles of the Marble Arch, and is situate adjoining the Willesden Green Station of the Metropolitan Railway. It consists of sixteen acres of nicely-timbered land,

with also a good family residence, with stabling, outbuildings, and entrance lodge, and altogether is a valuable investment when open areas are becoming scarce in the immediate neighbourhood of the metropolis. Mr. Collier also recently sold by private auction for 9,000*l.* a choice freehold estate of about seven acres at Chiswick, comprising the whole of the east side of Duke's Avenue, the principal approach to Chiswick House, the Duke of Devonshire's historic villa.

WRIGHT'S FIXING BLOCKS.

MESSRS. WRIGHT & CO., 3 Westminster Chambers, Victoria Street, S.W., have sent us a catalogue they have just issued, enlarged and revised. Their patent improved fixing blocks for walls have been successfully applied to buildings of every description during the past five years by architects, contractors, H.M. War Department, &c., with the very best and most satisfactory results. These blocks are fireproof, practically as hard and lasting as brick or stone, yet of such a tough nature that not only will they take nails with facility and retain them, but the hold is firmer than if driven into wood. For walls they are made about the same size as ordinary bricks. They are built into reveals of openings, jambs, &c., without the slightest extra labour or trouble to the bricklayer, and without interfering with the bond of the brickwork.

The blocks simply require bedding in mortar; when the work is sufficiently set, they offer a superior fixing for the wood linings, architraves, &c. These in reality become fixed to the solid wall, dispensing entirely with the troublesome process of using wood pallets, strips, &c., which, among other disadvantages, invariably require "wedging up," involving thereby a loss of carpenter's time. There is no waste when using these blocks, as is the case when wood joint-pieces are employed. The driving of plugs, and consequent injury to new work, is entirely obviated—a frequent source of danger round chimney-breasts and near flues, in party walls, &c. Wright & Co.'s blocks may be safely inserted in these positions without the slightest risk of taking fire. For fixing wood chimney-pieces they are invaluable.

Another application of these blocks does away with the necessity of putting skirting chocks into, and wood grounds upon, walls. They are made for this purpose about three-quarters of an inch wider than the ordinary bricks, offering for the plastering a similar, but from the affinity of the respective materials a better, key than that obtained when using the splayed wood ground. This size block may also be used with great advantage where walls are to be boarded, as in the case of dados, matchboarding, &c., and they may be used for securing fibrous plaster slabs, or similar materials, or where walls are to be battened for slate or tile hanging, &c. By turning straight or slightly cambered arches over ordinary inside openings, and inserting in same a couple of these fireproof blocks as a fixing for the head lining, the wood or concrete lintel may be omitted, shorter arches may be employed, and a saving may thereby be effected. These blocks are applicable to either brick, stone, or concrete walls, and are guaranteed to carry any weight that can be put upon them in a building.

A special new feature for the first time illustrated appears in this catalogue, namely, Wright & Co.'s floor blocks, which, it will be seen from the diagrams, have as secure a hold as a lewis in a block of stone. The particular composition of which Wright & Co.'s blocks are formed unites readily with the

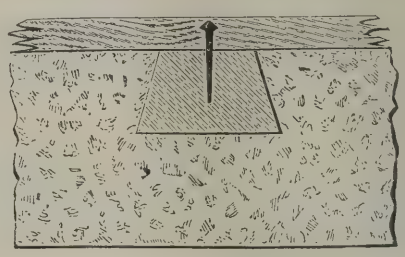

FIG. 1.

general body of the concrete when laid, and in reality it then forms part of the actual floor. A minimum thickness of floor is obtained, and therefore there is a saving of labour and materials. There is a complete absence of the undesirable wood blocks, fillets, strips, and other similar perishable material sometimes introduced into so-called fireproof systems, and which, we submit, must be an element of weakness from the first, this being by no means lessened when in course of time the wood decays, or in case of fire becomes burnt or desiccated. By keeping the blocks flush with the top of concrete (see fig. 1) no spaces

L'ART,

A COSMOPOLITAN ILLUSTRATED JOURNAL,

CONTAINING TWO VERY FINE ENGRAVINGS IN EACH NUMBER,

Will be published simultaneously in LONDON and PARIS on the 1st and 15th of each month, and will contain articles by the best French writers on Architecture, Painting, Sculpture, Art Galleries, Exhibitions, Dramatic Art, Museums, &c., &c. Reviews will also be given of all new books published on these subjects.

MESSRS. GILBERT WOOD & CO.,

OF 175 STRAND,

Being the Sole Publishers for Great Britain, all Communications should be addressed to them concerning Subscriptions, Advertisements, and Copies of Etchings, Engravings, and Medallions in Bronze, &c., &c., of the French Library of Art.

are left under the boards for the accumulation of dirt and impure air, an inexpensive, sound construction is obtained, and one well worth consideration when (as is sometimes the case) the outlay will not admit of an ordinary wood block being laid.

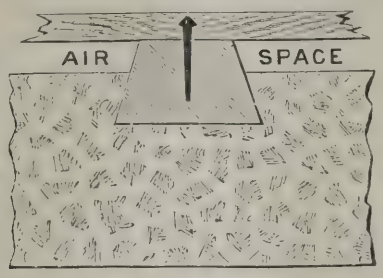

Fig. 2.

If, however, an air space under the boards is considered desirable, the blocks may be kept up as in fig. 2.

Fig. 1. shows the concrete portion of a perfectly fireproof floor, which can, by the aid of Wright & Co.'s improved blocks (and rolled iron joists), be readily constructed by any ordinary contractor; and this system may be applied to any class of

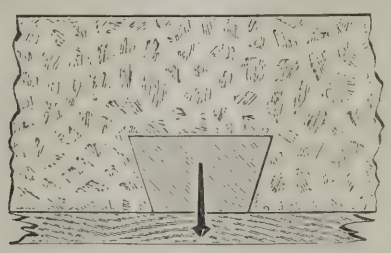

Fig. 3.

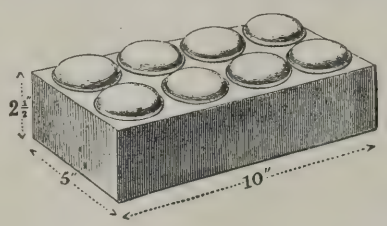
building with perfect success, and at less cost than any other method possessing equal advantages.

Fig. 3 illustrates the application of the C size blocks to soffits of floors or ceilings to receive matchboarding, fibrous plastering, or other finishings, without using any objectionable wood blocks, or other perishable material. This system has been successfully adopted in extensive works of the highest possible class.



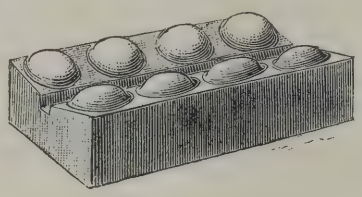
All floor blocks, unless otherwise ordered, are made 1 foot long, the only care necessary to their successful operation being that they should be laid level, with ends touching; the distance apart may vary from 14 to 18 inches, depending upon circumstances.

TORBAY PAINTS.

We have received a catalogue from the Torbay (Wolston's) and Dart Paint Co., Limited, of Dartmouth, Devon. Mr. Wolston claims to be the originator of the genuine Torbay paint, the great merit of which is its being free from any adulterant, and consisting of pure natural oxide. This firm have other works at Dartmouth, and mines at Brixham and Stoke Gabriel. We notice that the firm have a very influential connection, for amongst works completed are Lambeth Bridge, National Gallery, Zion College, Girton College; and this paint is specified in H.M. Government Contract Schedule. No higher testimony of the excellence of this speciality could be given.

TEBBUTT'S PATENT "SAFETY" BRICK.

Mr. C. G. Tebbutt, of Dashwood House, New Broad Street, E.C., has a great improvement on the ordinary stable brick in his patent "safety." Instead of the ordinary square or longitudinally grooved brick, Mr. Tebbutt's patent has a treading



surface upon knobs about 2½ inches across, ½ an inch high, and ⅜ths of an inch apart. The surface of each knob is rounded so as to guide the hoof downward against the next knob when foothold is required. Mr. Tebbutt has laid several floorings for

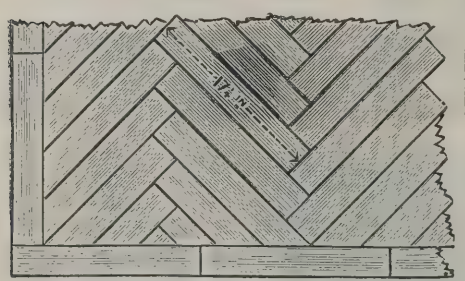
stables and markets with the object of preventing injury to horses and cattle, and in every case he has given satisfaction. Mr. Tebbutt is now supplying the establishment of His Royal Highness the Prince of Wales, at Sandringham. It is evident, too, that the patent safety brick must facilitate the drainage of stables, for the raised surface and width between each knob allow of liquid easily passing away, and the floor being easily cleaned. The "patent safety" is made of the best Staffordshire blue ware, hard, non-absorbent, and durable.

We subjoin an illustration of the "patent gutter brick," on the same principle as the "safety." Mr. Tebbutt exhibited at

the Building Exhibition in the Agricultural Hall of April last, at which he was awarded a silver medal—the highest in the class—so that to many of our readers this improvement will have been appreciated. The "patent safety" is certain to become widely adopted on the strength of its great merit.

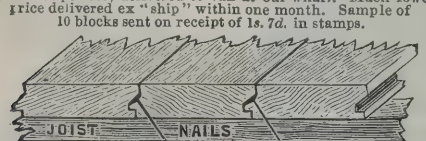
SHAND, MASON & CO.—VISIT OF THE COLONIALS.

A NUMBER of the Colonial representatives visited the works of Shand, Mason & Co., the well-known fire-engine makers, their object being to witness a trial of two new pattern steam fire-engines made for the Insurance Companies Fire Brigade, Melbourne, Australia. After inspecting the machines, the excellent workmanship and finish of which were greatly admired, steam was raised in three minutes forty seconds, the total time occupied in raising 100 pounds being eight minutes. The water was projected far over the shaft in the works to a height of about 160 feet. An improved London brigade manual fire-engine was also tested with equally satisfactory results. All present, amongst whom were Sir Graham Berry, Agent-General for Victoria; Mr. Bosisto, and Mr. Thompson, President and Secretary of the Victorian Commission; the Hon. W. Wilson, of Melbourne, expressed great satisfaction at the results obtained, and inspected, amongst others, three of the five new steam fire-engines made for the Metropolitan London Fire Brigade; also one for the Midland Railway Company, for use at Derby, and a new steel fire-escape to be drawn by horses for Buenos Ayres.



DRAINAGE OF THE HOUSES OF PARLIAMENT.

THESE works, and the ventilating works connected therewith, on the Shone Hydro-pneumatic system, as recommended by the late Committee of the House of Commons, which consisted of Sir H. Roscoe (chairman), Mr. L. H. Isaacs, Dr. Farquharson, Sir Guyer Hunter, Mr. Lyell, Mr. R. Power, Mr. Tatton Egerton, and Mr. Cyril Flower, have just been commenced, and will be carried forward with all possible speed. The engineer for the works is Mr. Isaac Shone, C.E., 4 Westminster Chambers, and the resident engineer is Mr. John Phillips, C.E., of Putney. The Commissioners of Her Majesty's Works and Public Buildings have let the works in three contracts, viz., for the general works to Messrs. John Mowlem & Co., of Westminster; for the pneumatic and hydraulic ejectors, to Messrs. Hughes & Lancaster, of Chester and Liverpool; and the gas-engine air-compressors, to the British Gas Engineering Company, Queen Victoria Street, London. The total amount of the three contracts is under 10,000*l.*



WHITWORTH SCHOLARSHIPS.

WILLIAMS & CO.,
Lillie Bridge Works, London, S.W.,
MANUFACTURERS OF PATENT
METAL CASEMENTS
AND
LEADED WINDOWS.
Our Patent Steel "SIMPLEX" Casements have the following advantages over any other Casements in the market:—
They are thoroughly weathertight.
They can be made to open inwards or outwards, hung at the sides, or head, or sill, and in all cases the PLANE OF GLASS and the SIGHT LINE are the same.
They will not SAG, or TWIST, or JAM.
The Glass being secured by metal fillets the ragged appearance of putty is avoided.
The face being moulded has a more pleasing appearance than the ordinary uncouth finish.
By the use of these Casements all difficulties of window-cleaning are overcome.
The Patent "Cottage" Casement is made for such positions where plane of glass and thorough weathertightness are not absolute requisites, and where the extent of finish is not necessary.
Prices and particulars will be gladly furnished on receipt of inquiry.

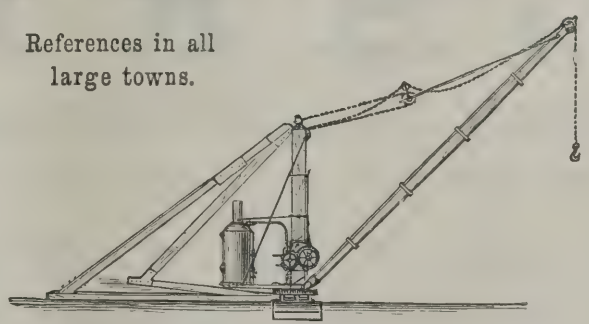
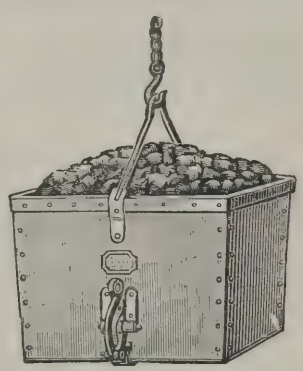
CROYDON CONCRETE.

On Tuesday Richard Moat, builder, was summoned before the Croydon magistrates, under the corporation by-laws, for using improper materials for the foundations of houses which he was about to erect in Crowther Road, South Norwood The Town Clerk, Mr. C. M. Elborough, appeared for the prosecution, and said that the defendant had sent in an application for permission to build some small houses in the above-mentioned road. Leave was given him, but there were certain regulations with with which he had not complied. The Bench knew how much the health of the people depended upon the manner in which houses were built, and, as the corporation considered this case a very bad one, he would ask the magistrates to make an example of the defendant. Mr. Thomas Walker, the borough engineer, deposed that on Thursday, the 6th inst., he was in the Crowther Road, South Norwood, and saw some men in the service of the defendant putting what should have been concrete into the trenches for the foundations of two houses. The so-called concrete was no better than farmyard manure, and was not fit for the purpose for which it was being used. Concrete should be composed of clean gravel, lime, cement, &c., properly mixed with water. When it was set it should be as hard as any stone. The stuff which he saw would not set properly. The trenches were only dug down from 9 to 12 inches. He admitted that the ground was fairly solid, but the material which was being used for the foundations was only good manure. The defendant did offer to remove the stuff and put in proper concrete. The defendant explained that the material was used by his men during his absence. Richard Jones, a sanitary inspector, stated that the concrete produced was not at all suitable to put in as footings for a wall. It would cause a settlement, and give rise to dampness, besides which it would not set. In fact, it was manure more than anything else, and would form a kind of drain under the wall and make the houses unhealthy to live in. The defendant pleaded that the material was used without his knowledge, and that he offered to substitute proper concrete for it. The chairman said it was the duty of the Bench to see that small houses were constructed in a proper manner as well as large ones, and the defendant would be fined 40*s.*, with 13*s.* costs. The money was paid.



THE ASSESSMENT OF CREWE RAILWAY WORKS.



At a full meeting of the Nantwich Board of Guardians on Saturday, Mr. J. Edwards, deputy chairman of the Assessment Committee, reported the result of the interview which the committee had had with Mr. Edmonds, rating agent of the London and North-Western Railway Company, with regard to the valuation of Crewe Locomotive Works and other railway property in the union. He said that three years ago Mr. Marshall, a professional valuer employed by the union, raised the assessment of the railway company to 95,000*l.*, being an increase of 80 per cent. The company on that occasion suggested their willingness to agree to 75,000*l.*, to which the Guardians could not assent. The company then appealed, and were successful, the result being that the whole union had been revalued. Now, however, that the union had been revalued, the company, instead of renewing their old offer, suggested 68,000*l.*, being a reduction of 7,000*l.*, and 27,000*l.* less than that arrived at by Mr. Marshall. The reason assigned for this reduction was the falling off in the traffic receipts of the company. The Assessment Committee did not care to take the responsibility of either accepting or rejecting this offer without the advice and direction of the Guardians. A lengthy discussion followed upon Mr. Edwards's statement, several of the Guardians, also members of the Assessment Committee, urging the Board to endeavour to settle the whole question without having recourse to further litigation. It was stated in answer to the allegation of the company's agent that the traffic receipts had gone down, that there was also great depression in agriculture, but that the four valuers who had revalued the agricultural portion of the Union had not taken that into account in making the reassessments. Mr. Whale, an official of the railway company, said he was there to represent the ratepayers, and he could not see that it was fair to increase the

railway property by 80 per cent. and increase the agricultural assessments by only 12½ per cent. Mr. Bateman, in reply, said that while agriculture had been at a standstill, or had declined, there had been an increase in railway work, and railway matters had developed to a great extent in that Union. Eventually four propositions were put to the meeting—1, that the Assessment Committee should take the advice of Mr. Marshall, the professional valuer, before proceeding further, and then see the company's representative; 2, that the committee be at liberty to try and come to terms with Mr. Edwards, not accepting less than 75,000*l.*; 3, that the offer of 68,000*l.* be accepted in order to avoid the expense of any further valuation or litigation; 4, that the question be referred to arbitration. The third proposition received only the votes of the proposer and seconder, both guardians being officials of the railway company; the second and fourth propositions were not largely supported, and the first proposition was carried by a majority of over twenty. The Assessment Committee afterwards decided to invite Mr. Marshall to an interview as early as possible. The matter is likely to come before the Cheshire Quarter Sessions again.

BUILDING WITHOUT AN ARCHITECT.

AT the Birmingham Assizes, on Monday, an action was tried before Mr. Justice Wills which had been brought by James Parsons, of Fazeley, builder, against Thomas Ellis, of Kingsbury, butcher, to recover 130*l.*, balance of account. By agreement the case was heard without a jury. The plaintiff contracted to rebuild a house and outbuildings for the defendant. The contract was 403*l.* The specifications on which the contract was based, according to the plaintiff, were very imperfect, and no proper architect was consulted. The result was that an unusual number of "extras" had to be done, the bill for these amounting to 47*l.* The completion of the work was delayed for some weeks beyond the specified time, according to plaintiff, entirely through the weather and the extra work. Defendant disputed the extras, and put in a counterclaim of 40*l.* for damages and 220*l.* as penalties for delay in the execution of the contract. Plaintiff and professional witnesses having given evidence as to the details of the work, his lordship gave judgment for the plaintiff on the claim, with the costs of the action, and for 10*l.* on the counterclaim, with costs on that amount.

MASONRY DAM AT THE VYRNWY WATERWORKS.

A DESCRIPTION of the great works which are in progress at Vyrnwy, for the purpose of constructing a reservoir for the supply of water to Liverpool, appears in the *Liverpool Post*, from which we take the following:—

A drive of about two hours from Llanfyllin brings one right to the foot of the valley which is eventually to become the Vyrnwy reservoir, and where what is generally spoken of as the embankment, but which is really a masonry dam, is being constructed. This dam will, when completed, block up the entire valley, and when the reservoir is filled with water it will constitute a lake five miles long, with an average width of half a mile and a maximum width of three quarters of a mile. Some conception of the vastness of this great reservoir may be gathered when we mention the fact that Bala lake is only three and three-quarters of a mile long, and that, although Loch Katrine, from which Glasgow obtains its water supply, is considerably greater in area, the Vyrnwy reservoir when completed will contain a very much larger storage of water than even Loch Katrine, which is about double the length, and will, in fact, be the largest lake in the Principality. The greatest depth of water in the lake will be 84 feet.

In the centre of the valley is the village of Llanwddyn, with a population of about three or four hundred people, with its parish church, schoolroom, and three public-houses, all of which, with several farms, and Ennant Hall—formerly a shooting box owned by Sir E. Buckley, but now utilised by the Corporation of Liverpool for the accommodation of those members of the City Council and the Water Committee who from time to time visit the works—will be submerged when the reservoir is full. The inhabitants of the village will doubtless find ample accommodation at a new village called Cynon-isaf which has sprung into existence in the neighbourhood of the dam since the works were commenced, whilst a new church and a vicarage have been erected by the Corporation of Liverpool in the same locality. It has also been necessary to make two new roads—one on each side of the reservoir—to compensate for the absorption of the existing road, which now runs through the valley towards Bala. These roads have been admirably constructed under Mr. Deacon's direction, and, with the various bridges which have had to be built at several points in each, have cost 3,500*l.* per mile, their total length being over 10 miles. When the new lake is filled in they will form one of

PRICE TWO SHILLINGS PER COPY (2 frs. 50 c.).

The Choicest Etchings of celebrated works, and **STEEL** and **COPPERPLATE ENGRAVINGS** of the works of the leading artists of Europe, as well as articles by the ablest living writers on Art and cognate subjects, appear in every number. Size of plates, 18 inches by 12 inches. May be ordered through any Newsagent or Bookseller, or at any Railway Bookstall in the United Kingdom, or from **GILBERT WOOD & CO.**, 175 Strand, London.

the finest drives to be found either in Wales or any other part of the country. The chief work in connection with the construction of the reservoir is, of course, the masonry dam, which is rapidly proceeding towards completion, and when finished the reservoir will practically be completed for the purposes of impounding. The valley itself will be left pretty much as nature has made it, though here and there something may have to be done in the way of facing the sides of the valley with stone or concrete.

The total area of the new lake will be 11,000 acres, and will be capable of containing 12,000,000,000 gallons of water available for supplying the wants of Liverpool, though, of course, the lake itself will contain a much larger quantity. If required, a supply equal to 40,000,000 gallons per day could be obtained from the lake, but at present it is proposed to take off only about one-third of that quantity. Whenever it is found necessary, however, to increase that quantity, two additional drainage areas could be drawn upon and brought into Lake Vyrnwy, namely, Marchant and Cowny, and the Act of Parliament authorises the Corporation, whenever found necessary, to construct two tunnels to bring the water from those drainage areas into the lake, those proposed tunnels being in close proximity to the embankment at the bottom of the valley.

The water for Liverpool will leave the new lake by means of a tunnel 7 feet in diameter, and 2½ miles long, and which will be sufficient to draw off not merely 13,000,000 gallons per day, as is now proposed, but 40,000,000 should it ever be found necessary to resort to that amount. After leaving the tunnel, the water will be conveyed to Prescot in iron pipes 40 inches in diameter, most of them being underground, but occasionally, where valleys intervene, they will be laid on arches. At Runcorn they will cross under the Mersey. Should it become necessary to increase the supply afterwards, two additional lines of pipes can be laid, both of which will be served with water from the existing Hirnant tunnel. The total distance between the lake and Prescot reservoir is about 76 miles, and the pipes for the greater part of this distance have already been laid.

In the construction of the dam, as everybody knows, has lain the most arduous part of the great undertaking. Mr. Hawksley was at first associated with the work as chief engineer, and both he and Mr. Deacon were understood at first to be in favour of an earth embankment, but the original scheme was eventually departed from, and a masonry dam decided upon. Before fixing the site of the dam the position of the rock beneath the beds of alluvial and glacial deposits which cover the whole valley was determined by 13 shafts and 177 borings or probings. Before the autumn of 1882 the lowest surfaces of the rock were uncovered, and it was found, as had been anticipated from previous examination of the exposed rocks on either side of the valley, that the rock foundation was continuous from side to side. Geologically, the rock belongs to the Caradoc group of the lower silurian system. It is commonly known as clay slate, is frequently interspersed with the hard volcanic ash of the Bala series, and ranges from a close-grained grit of dark bluish-grey colour to a fine slate texture.

The masonry employed in the construction of the dam may be classed with that generally known as "Cyclopean rubble," though both the materials used and the precautions taken in connection with the workmanship give this particular work a much higher value as masonry than is generally attributed to rubble work even of the best kind. The quarry is at a distance of about a mile from the masonry dam, and is connected therewith by a double line of railway of 3-feet gauge, having a gradient of about 1 in 30 downwards to the dam. The rock, like that of the foundation, belongs to the Caradoc group of the lower silurian system. The sound beds, which are alone employed, yield a hard and durable dark grey stone, weighing 2·06 tons per cubic yard, and having a specific gravity of about 2·721, from which, with great labour, even ashlar of excellent quality may be produced. The difficulty of working the rock arises from the fact that the planes of cleavage with which it abounds are neither perpendicular to the beds nor to each other, so that neither by blasting, plugging, nor wedging can stones of rectangular form be obtained. Various methods have been tried for detaching the rock, but none have proved so satisfactory as simultaneous electric blasting with powder. The quantity of powder used from the beginning of the work has been only 2·6 ounces per ton of stone quarried, and for the last year only two ounces. This is just sufficient to detach the mass, which is afterwards subdivided by plugging into the largest available blocks, subject to none of them exceeding in weight when subsequently dressed seven or eight tons each.

The greatest care is taken in preparing the stone taken from the quarry for the purposes of the dam. The lower surface is made almost smooth, with just sufficient roughness to make it grip the cement in which it is embedded, whilst every stone is carefully washed with a strong jet of water to insure that not a single particle of dirt adheres to the stone before it is put in

THE BRITISH DINNER COMPANY, LIMITED.

Incorporated under the Companies' Acts, 1862 to 1883, whereby the liability of each Shareholder is limited to the amount of his Share.

CAPITAL £25,000, divided into 25,000 Shares of £1 each,

Payable 2s. per Share on Application and 8s. per Share on Allotment, after which further calls will be made as required for the development of the business. It shall be optional, however, for Shareholders to pay up in full at a reduction of 5 per cent. Where no Allotment is made the application money will be returned in full.

TEMPORARY OFFICES.—15, 16, 17 The Outer Temple; 222-5 Strand, London, W.C. (opposite the Royal Courts of Justice).

This Company has been formed for the purpose of establishing Depôts over the Metropolis and elsewhere to supply good, wholesome, nutritious, well-cooked food suitable for working classes and others of small means at the lowest possible cost.

On the Continent and in Scotland there are numerous establishments where substantial dinners, at low prices, are provided for the people, yielding handsome dividends to the Shareholders.

Good meat dinners, with portions of potatoes, and a second vegetable—turnips, cabbage, or other seasonable kind—and a first course of either good soup or fish and bread, can be supplied for sixpence, and yield a profit equal to 25 per cent., which is proved to demonstration in Glasgow, where similar food is supplied with a good profit at even a lower price.

It is a well-known fact that New Zealand mutton and American beef (both of first quality) can be bought on the London markets at prices ranging from 4½*d.* to 5*d.*, and 5*d.* to 5½*d.* per lb. respectively, both of which are served daily in first-class London restaurants as "prime Scotch or English meat."

All the food will be of good quality, and carefully prepared, so that the nutritive properties are retained. Families will find this the best opportunity for obtaining ready-cooked dinners at less cost than they could be prepared at home.

The Directors have secured the services for five years of Mr. Emanuel Duret as General Manager at a nominal salary and commission, *pro rata*, after the Shareholders *first receive* dividends of not less than 5 per cent. Mr. Duret has had great and varied experience, and has made the matter of "cheap food for the million" his special study for over a quarter of a century, practically and theoretically, both on the Continent and in England. He has had the greatest and most varied experiences as Manager and Caterer. He is thoroughly conversant with the management of large establishments, and well acquainted with the best markets for meat, fish, provisions, &c.

1. He managed the St. James's Hall Restaurant, Regent Street and Piccadilly.
2. Was Contractor and Caterer to the Admiralty.
3. The Directors of the North-Eastern Railway Company selected him out of about 300 candidates, and appointed him Manager of their Hotel and Refreshment Rooms at York, which he opened and conducted to the entire satisfaction of the Board.
4. He was Proprietor and Manager of the Manor House Hotel at Leamington, and holds the highest and most complimentary testimonials from those by whom he was employed, as well as from the Speaker of the House of Commons, the Earl of Camperdown, and many other distinguished noblemen and gentlemen, testifying in the strongest terms to his great ability, courtesy, and efficiency as a public caterer.

The philanthropist and economist combine when placing a cheap, nutritious, palatable meal within the reach of the working-man at a fair profit. It has been statistically proved that a working-man spends about

60 per cent. of his wages in Food.
15 „ „ Rent.
10 to 12 „ „ Clothing.
13 to 15 „ „ Gas, coals, rates, taxes, education, &c.

This enormous expenditure of 60 per cent. shows that food ranks first amongst the necessaries of life, and that the claims for food assert themselves before all others; therefore the question of a thorough food reform is of much more importance than the question of housing, and deserves the greatest attention on the part of the public. If a working man were provided with a house, rent free, the effect would only be a saving of 15 per cent., but a rational food reform would save him 30 per cent., or twice as much as the whole of his house rent.

It is well known that one of the most successful private commercial undertakings in London is Lockhart's Cocoa Rooms, now established all over London and throughout the large provincial cities and towns. The trade, however, is confined principally to tea, coffee, cocoa, cakes, &c.

The Aerated Bread Company (Limited) also supply tea, coffee, cocoa, bread, butter, cakes, eggs, and some cold or preserved meats, and, like Lockhart's, they have and are continually opening depôts all over the metropolis, paying steadily increasing dividends, and the shares consequently are at very high premiums.

The British Dinner Company (Limited) intends to supply not only what can be obtained at the before-mentioned establishments, but also what a working man requires most—namely, a substantial dinner, consisting of a basin of good soup or fish, a plate of meat, and a portion of both potatoes and another vegetable and bread, for sixpence, well prepared; a comfortable room, tables scrupulously clean, with good and prompt attendance.

This Company will buy meat, vegetables, tea, coffee, and all other provisions in large quantities for cash, obtaining them at very much lower prices than private individuals. It is contemplated to buy provisions, potatoes, cabbages, turnips, onions, and eggs direct from the farmers, thus saving all intermediate profits.

The only contract that has been entered into is made between the Temple Syndicate and Mr. Eustace A. S. Hounsell as Trustee for and on behalf of the Company, whereby the Syndicate contracts to pay all Rent of Offices, Salaries of Secretaries and Clerks, Printing, Stationery, Postages, Advertising, and all Costs and Expenses incidental to the registration, formation and floating of the Company generally up to the date of allotment of Shares for the sum of £750 and 750 fully paid Shares in the Company.

Prospectuses and Forms of Application may be had of the Bankers, or at the offices of the Company. The agreement above referred to and the Memorandum and Articles of Association may be seen at the offices of the Company.

Applications for Shares may be made to the Bankers, or to the Secretary. All cheques should be crossed with the name of the Company's Bankers, and made payable to the Secretary.

position on the embankment. The particular stone used in the construction of the dam is of a specially durable character, owing to the peculiar homogeneity which characterises it, and is said to be even more durable than the hardest of granite. On the dam and at the quarry there are in all about 1,400 men employed, and on a visit to Vyrnwy on Saturday forenoon every available man was found busily at work. At the quarry the men are engaged on piecework, but, owing to the importance of attention to minute details in the construction of the dam, it is considered undesirable to give the builders any direct interest in the quantity of work done on the embankment, and they are therefore paid a weekly wage. Not only is the masonry required to be of exceptional strength, but it must be watertight, as far as that can possibly be secured.

The superintendence of the work on the embankment is of the most complete character. The men are divided into gangs, of which one man has charge, and two officials are constantly on the spot seeing that each stone is properly put down, and that every precaution is taken to insure the stability of the work, whilst the whole of the staff is under the control of Mr. Martin, the chief superintendent, who discharged similar duties at Rivington, the construction of the dam and the general arrangements being of course carried on under the direction and personal supervision of Mr. Deacon, who is now sole engineer for the new works. The stone is brought down from the quarry by wagons drawn by locomotives at the rate of 500 tons a day. The blocks are lifted upon the wall by seven steam cranes, one of which is generally in the "hospital," in other words undergoing repairs, and there are about the same number of locomotives for bringing the stone from the quarry, whilst the number of wagons engaged in this and other works is between 300 and 400. The number of horses employed in carting material to the works is very little short of a hundred, and, notwithstanding the bad roads they have to encounter, every one of them seemed in first-class condition.

At first sight the dam itself looks comparatively insignificant. This is partly due to the magnitude of the natural surroundings, and partly to the fact that 60 feet of the dam is entirely under ground, excavations to that depth having to be made before a rock foundation was found. When completed it will attain a height of 84 feet above the surface, making a total height of 144 feet. That it is in reality a much more colossal work than it at first sight appears may be gathered from the fact that when completed the wall will be half as long again as Lord Street, its length being 1,250 feet. At the base it is much broader than Lord Street, and if placed on a level with the houses in that thoroughfare it would be considerably higher. Above the dam will be a viaduct with several arches, connecting the two new roads skirting the lake. The total amount of material required to complete the wall is 536,000 tons, and our readers will be able to judge for themselves as to what stage the dam has reached when we mention that already 360,000 tons of stone and concrete have been utilised in its construction.

The Corporation, under the Act of Parliament, are bound to turn into the Vyrnwy below the dam compensation water to the Severn Commissioners at the rate of 10,000,000 gallons a day. This compensation water will be discharged through a tunnel on either side of the masonry dam, and will on an average be greatly in excess of the water which, by means of the Vyrnwy, at present finds its way into the Severn. The rainfall in the gathering ground which will feed the lake is so great—last year at the head of the proposed new lake there was a rainfall of no less than 117 inches—that at times there will most certainly be more water than the lake will be able to hold, and this flood water will make its escape over the top of the embankment and underneath the arches of the viaduct which in time is to be constructed.

Of the total number of men employed on this great undertaking, quite one-half of them are natives of that part of Wales, who had practically to be taught the work, their former occupation being that of farm labourers. The remainder are chiefly English, very few, if any, Scotch or Irish being on the job. The work has now been going on for over five years, having been practically begun early in 1881 or late in December of 1880. In two years Mr. Deacon hopes the whole work will be completed, and that by that time they will be able to begin to impound the water. Another year will probably elapse before the supply can be drawn upon, so that we may anticipate that within three years from now Liverpool will have at its disposal 13,000,000 gallons of water daily in addition to its present supply. The cost of this new supply will be 1,750,000*l.*, about a quarter of a million more than was originally estimated, but this increase is largely due to the substitution of a masonry dam for an embankment. This will probably meet all the requirements of the city and district for twenty years, but, as we have stated, this additional supply can be doubled or trebled without going elsewhere whenever the necessity arises, the total cost involved in completing the scheme so as to afford a daily supply of 40,000,000 gallons of water being 3,250,000*l.*

PUBLISHERS, GILBERT WOOD & CO., 175 STRAND, LONDON, W.C.

"THE PEDESTAL VASE,"

JENNINGS' IMPROVED W.C. APPARATUS

(Combination Urinal and Slop Sink).

Registered No. 16,300.

A PORCELAIN VASE set on a tiled or mosaic floor, within walls or a dado of glazed tiles. The usual wood framing, forming a storehouse for the retention and accumulation of *damp*, *dirt*, and *disease germs*, with the joints, crevices, and imperfections in work which the closet enclosure so often conceals, is entirely abolished. The seat is hinged, permitting free access for use as a *slop sink* or *urinal*, and for cleansing, so that the entire apparatus and space can be freely washed down. For this latter purpose the floor should be slightly sunk, and laid to fall to a grating, with waste carried through the external wall, and terminating in a copper flap valve to prevent draught.

☞ The suggestions as regards wall linings and floor, may, of course, be modified as best adapted to the building in which the closets are used; and in the consideration of such details, alternative schemes will readily present themselves.

At the recent **HEALTH EXHIBITION** (South Kensington, 1884), amongst a series of official tests, under the supervision of Baldwin Latham, Esq., C.E., and the Jury No. 9, Class XXIII., and successfully withstood by this closet, the following may be cited in evidence of its efficient action. Being fixed in position shown in illustration, with **"JENNINGS' PATENT SINGLE FLUSH WASTE-PREVENTING SYPHON CISTERN"** 5 feet over, with 1½ inch down pipe, ten apples (averaging 1¼ inch diameter) and a flat sponge about 4½ inch diameter were thrown into the basin. The water, as well as the whole of the exposed or dry surface, was first blackened with plumber's "smudge," and the sides covered by four pieces of thin sanitary paper, which adhered closely to the soiled surface. The handle of the cistern was then pulled, and the two-gallon flush liberated. After seven seconds (the time occupied by the discharge), a receiver placed under the trap outlet was removed, containing in the blackened water **the ten apples, the sponge, and the four pieces of paper,** no traces of the soil remaining visible upon any part of the apparatus.

GOLD MEDAL AWARDED.

THESE CLOSETS are already in use in Hospitals, Banks, Hotels, Offices, Private Residences, &c., with most satisfactory results, and, fixed in the manner described, in appearance and action leave nothing to be desired. By the novel arrangement of the supply to Basin, as shown in the sectional sketch annexed, the whole surface is well flushed and cleansed, whilst the bottom of Basin and Trap are thoroughly scoured by a concentrated rush of water which insures the **instantaneous removal** of the contents, thus overcoming the inherent defects in the many imitations recently produced of **"JENNINGS' MONKEY-CLOSET"** (the **original form of wash-out watercloset**), which was invented and patented by G. J. in 1852.

A Business Supplement

The Contract Reporter.

to The Architect.

LONDON, AUGUST 20, 1886.

L'ART,

Price Two Shillings, can be ordered from all newsagents, and at any railway bookstall; or through the publishers for Great Britain, Messrs. GILBERT WOOD & CO., 175 Strand, W.C.

The scale of charges for Advertisements is as follows, and Advertisements intended for insertion in the following Number must reach the Office not later than the 24th or 8th of the month:—

ADVERTISEMENT SCALE.

For Two Lines and under (nine words to the line)	£0 5 0
For every additional Line	0 1 6
Per Quarter Page	6 0 0
Per Half Page	11 0 0
For a Page	21 0 0
For 1 inch deep by 2½ wide	0 15 0

Special arrangements may be made for a series of insertions on application to the Publishers, GILBERT WOOD & Co., 175 Strand, London, W.C.

NOTICE.

We have appointed Mr. JOHN BERGER, *of New York, our agent for the United States and British North America, for receipt of Advertisements and Subscriptions to* THE ARCHITECT AND CONTRACT REPORTER.

PLUMBERS' REGISTRATION.

IT will be seen from an announcement in another column that the Plumbers' Company again invite all qualified plumbers to protect themselves (and the public as well) by having their names recorded in the register of the Company. From the constitution of the special committee, it will be impossible for any competent applicant to be rejected. Men who have belonged to the trade prior to March 1, 1886, are not, unless in exceptional cases, required to submit to any examination; and when it is considered advisable to test the candidate's qualification, the Examining Board is composed mainly of practical plumbers. The whole of the rules are inspired by a spirit of justice, and we hope masters and men will aid the Company in their efforts to enable the public to discriminate between competent and incompetent plumbers.

COMPETITIONS OPEN.

HALIFAX.—Sept. 1.—Plans for proposed Board School are invited from Architects of the Town. Mr. Robert Ostler, Clerk to the School Board, Halifax.

MAIDSTONE.—Sept. 5.—Designs for the Erection of Girls' School are invited by the Governors of the Girls' Grammar School. Mr. H. Monckton, Town Clerk's Office, Maidstone.

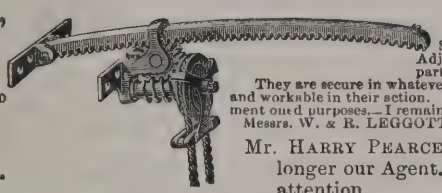
INTERNATIONAL HEALTH EXHIBITION.—MEDAL Awarded for

LEGGOTT'S PATENT ADJUSTMENT,

FOR FANLIGHTS, SKYLIGHTS, &c.,

Is admitted to be the best ever put before the Public.



From 5s. each.

Write for REDUCED PRICE LIST and Testimonials to

W. & R. LEGGOTT,

70 Park Road, Bradford, Yorkshire.

N.B.—Size and height of window no object.

TESTIMONIAL.

BANGOR, N. Wales: September 14, 1885.

Sirs,—I have pleasure in testifying that I have used Leggott's Silent Adjustments for various buildings to high skylights, fanlights, and top parts of windows, and in every case they gave satisfaction. They are secure in whatever position, whether the window is open or closed, and are quite simple and workable in their action. I prefer them to any other that I have seen or used for the above-ment oned purposes.—I remain, yours obediently, R. DAVIES, Architect.

Messrs. W. & R. LEGGOTT, Bradford.

Mr. HARRY PEARCE, 125 Great Portland Street, London, W., is no longer our Agent. All direct communications shall have our prompt attention. W. & R. L.

TRADE NOTES.

MESSRS. LEGRAND & SUTCLIFF, hydraulic engineers of London, are boring an artesian tube well at the residence of the Earl of Lovelace, East Horsley Towers, Surrey. The upper greensand has just been reached at the depth of 825 feet from the surface. The chalk was first met with at 33 feet, as the site of the boring is but a short distance from its outcrop; hence its total thickness has now been demonstrated to be 792 feet. Contrary to the general rule, very little water was found in the upper chalk, and it was not until 500 feet was reached that a good supply was obtained. Below this depth the chalk proved practically waterless. The water, when first reached, stood at 119 feet below the surface, and as the boring progressed rose to within 106 feet, or nearly 200 feet above Ordnance datum, but upon piercing the upper greensand it fell to 117 feet. The flint beds extended down to no less than 380 feet into the chalk, after passing through which the boring tool employed has been a 40-feet cylinder, which rotates automatically, and can be lowered 800 feet, and raised to the surface in the short space of thirty minutes. The total depth at present reached is 840 feet.

AN important addition has been made to Tilstock Church, Salop, by the erection of a reredos, which has been executed by Messrs. Jones & Willis, of Birmingham and London. The reredos is of oak, and contains five panels of decorated zinc, embellished with texts and sacred monograms.

THE Canadian Pacific Railway is likely to be used largely for exporting timber from the Dominion. Thirty-five hundred car-loads of square timber, representing two million square feet, arrived in Montreal within the last two months from Georgian Bay and Lake Nipissing districts. These consignments were formerly sent down by water.

MR. W. BIRKMYRE lately read a paper on "Revival of Trade by the Development of India" before the Glasgow Chamber of Commerce. It is now published in pamphlet form. The following passage will serve to explain the author's theory:—Give India adequate railway accommodation. In this you have also the key-note to improve trade for many years to come to nearly every industry in the United Kingdom. True, the iron trade would receive the largest and most immediate benefit, but as it is one of our largest industries, and the inter-dependence of trade is so linked in this country, that

SECTION.

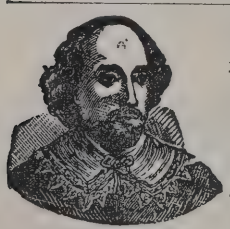
PLAN.

we do not exaggerate when we say that setting about in earnest to give India railways commensurate to the requirements of the country would mean the revival of trade to many of our industries—in short, it would be the opening out to capitalists and traders of a new industrial America, and at the same time add to the wealth of our fellow-subjects in India.

THE English Consul at Hiogo, Japan, reports that in the importation of iron machinery and plant on Japanese Government orders, a transfer of business has of late taken place from British to German firms, and probably, along with this, a transfer to some extent from articles of British to articles of Continental origin. In connection with this, there has been also a similar transfer of private business in these articles. This shows that the Germans are fighting English traders in other parts of the world as well as in Europe.

NOTES ON NOVELTIES.

MESSRS. WINCH BROS., of 24 Old Bond Street, have now on view a most attractive collection of photographic studies of Italian peasant life, taken instantaneously and printed by the platinotype process, the delicate softness and colouring of which greatly enhances the artistic effect of the grouping and the delicate play of light and shade. The series consists of some hundreds of pictures, principally landscapes, although among them will be found a goodly number of architectural studies, forming charming backgrounds to the picturesque groups of peasantry which really form the subjects of the pictures. The grace and naturalness of the posing of these figures, engaged as they are in their everyday occupations of drawing water, gathering olives, and plucking flowers, or indulging in local pastimes, leave nothing to desire—indeed, they are in many cases quite idyllic; while the innumerable details of Italian vegetation, quaint pottery, and costume, which are given with remarkable clearness and precision, should render them of the utmost value to artists and students as studies for handy reference.



X. L. MOSS LITTER.—Mr. John Bennett, of Railway Docks, Goole, seems likely to make the success of moss litter a reality. He has recently commenced the experiment of converting an extensive area of moor land to its manufacture, and claims that his genuine moss litter—as opposed to the spurious foreign stuff of that name—has decided advantages. Mr. Bennett's speciality is meeting with great favour not only for bedding purposes, but as a manure, being much less in bulk than straw, and consequently easier to remove. The price of the X. L. moss litter—manufactured at home—is, of course, cheaper than the ordinary imported article, and Mr. Bennett, being a large shipowner, with docks near the works, must have special facilities for a home and export business.

BUILDING IN BRADFORD.

THERE is much building going on at Bradford, and in this respect appearances remind one of the state of things which prevailed for some years before the staple industry became depressed. Probably there could be no better indication of the extent to which matters are returning to their former position, and certainly nothing more confirmatory of the confidence felt as to the commercial prospects of Bradford, than the activity of the building trade. A large extent of cottage property is being erected in some of the outlying parts of the town, especially in the Bradford Moor District, and in the neighbourhood of Barkerend Road, and it is surprising how quickly tenants are found for such as are completed. The same remark will apply to cottages recently built in the West Bowling and Brownroyd districts. The building trade has also received a "good lift" through the action of the School Board in deciding to have four large schools erected for the accommodation of children hitherto taught in various schools rented by the Board. These are at Fairweather Green; Thornton Lane, Little Horton; Cross Lane, Great Horton; and Drummond Road, Manningham. The latter is the most important, and its erection will cost about 10,000*l.*, exclusive of the site. It is intended to provide accommodation for about 1,200 scholars. Works of enlargement of some of the Board schools are also in progress. A large Catholic church, at the upper part of Manchester Road, is being erected, and will shortly be completed. A fine building at the junction of Cotewall Road and Manchester Road, comprising public baths and premises for a branch free library, which has been built by the Corporation, is receiving its finishing touches and will shortly be opened. The style of architecture is Gothic, the main feature of the building being an

octagonal tower. It is the first of a series of district baths which the Council sanctioned about two years since. The new post-office, at the junction of Bolton Road and Well Street, is now approaching completion; and although, in comparison with some of the surrounding warehouses, it appears dwarfish, in form and structure the building is an acquisition to the town.

STEAM FIRE-ENGINES FOR THE METROPOLITAN FIRE BRIGADE.

A NUMBER of engineers and scientific gentlemen attended the works of Shand, Mason & Co., of Blackfriars, London, to witness the trial of a steam fire-engine, made for the above brigade, being the completion of an order for five, making forty-six now in use by them, thirty-one of which have been supplied by the above firm. These engines embody all the latest improvements that have been introduced in any steam fire-engine, the principal features in these being increased size of steam cylinders, so that a higher pressure of water for the same amount of steam is obtained, and safety valves of a design which renders it impossible for the man in charge to obtain too high a pressure, and there is a very simple and effective feed water arrangement, while the axles are entirely of steel. Steam was raised in two and a half minutes from lighting the fire, cold water being used in the boiler, and at eight minutes a pressure of 100 lbs. to the square inch was indicated, and a stream of water was projected to a height of about 160 feet. High satisfaction was expressed by all present at the results obtained, and the trial was considered eminently successful.

EMPLOYERS' LIABILITY ACT.

THE Select Committee to whom the Employers' Liability Act (1880) Amendment Bill, and the Employers' Liability Act (1880) Amendment (No. 2) Bill were referred, and who were instructed to inquire into the operation of the Employers' Liability Act (1880), have considered the matters referred to them, and have agreed to the following report:—

Pursuant to the instructions of the House, your Committee have taken much evidence as to the operation of the Employers' Liability Act (1880). They have examined employers and workmen engaged in the leading industries, shipowners, seamen and fishermen, and legal witnesses of experience.

A general concurrence of opinion was expressed as to the advantages which the workmen have derived from the existing Act. The apprehensions as to its possible results in provoking litigation and imposing heavy charges upon employers have proved groundless, while a useful stimulus has been given to the establishment of provident funds and associations, in many cases liberally supported by the employers.

The following resolutions will supply the groundwork for further legislation:—

1. The operation of the Act of 1880 has been attended with no hardship to the employers, whilst it has been of great benefit to the workmen, and it is desirable that such Act should, with certain amendments, be renewed and made permanent.

2. No contract or agreement made or entered into with a workman shall be a bar or constitute any defence to an action for the recovery under this Act of compensation for any injury, unless on entering into or making such contract or agreement there was other consideration than that of such workman being taken into or continued in the employment of the defendant.

3. Such other consideration shall be—(*a*) That the employer shall have contributed to an insurance fund, for the benefit of such workman, against every accident arising in such employment. (*b*) That it has been certified by a competent authority that the employer's contribution to such fund bears a full proportion to the contribution of such workman, and that the benefit to be received by such workman from such fund is fully adequate, having regard, amongst other things, to the amounts recoverable as compensation under the Act. Provided always that if any amounts payable by such society or fund shall not be paid in accordance with the rules, the employer shall be liable to make good any deficiency so arising.

4. Wherever an employer enters into a contract, either written or verbal, with an independent contractor to do part of such employer's work, or wherever such contractor enters into a contract with a sub-contractor to do all or any part of the work comprised in such contractor's contract with the employer, such contract or sub-contract shall not bar the liability of the employer in respect of injuries sustained by any of the workmen of such contractor or sub-contractor, by reason of any defect in the condition of the ways, works, machinery, or plant, if such ways, works, machinery, or plant be the property of or furnished by the employer, and if such defect arose or had not

been discovered or remedied owing to the negligence of the employer, or of some person entrusted by him with the duty of seeing that the ways, works, machinery, or plant were in proper condition. Provision should be made to reserve any right of action which any workman may have against his immediate employer, or any right of action which the principal employer may have against his contractor or sub-contractor.

5. So much of Section 8 of the Act as defines the expression "person who has superintendence entrusted to him" as "a person whose sole or principal duty is that of superintendence, and who is not ordinarily engaged in manual labour," should be repealed.

6. The court should have power to allow an action for compensation to proceed, though no notice of injury should have been given, or, notwithstanding any insufficiency in the notice actually given, if the court should be of opinion that there was reasonable excuse for such want of notice or defective notice.

7. Where a workman is injured, and in the opinion of the judge who tries the action, or if the action is tried by a jury, in the opinion of the jury the amount of three years' wages, calculated as directed by section 3 of the principal Act, is an inadequate compensation for the injury in respect of which the action is brought, then upon an express finding to this effect, compensation may be awarded by such judge or jury to the extent of a sum not exceeding 150*l*.

8. Provision should be made enabling the judge before whom the case is to be tried, upon good cause shown, to order that the action should be tried before a special jury. In Scotland the parties should have the same rights as to trial by jury as exist in England.

9. The term "workman" shall include, besides the persons included in the definition in the eighth section of the principal Act, seamen, and all persons, including omnibus and tramway servants, who have entered into or work under a contract of service made with the employer, either verbal or in writing, and whether the work be performed in the employer's workshop, or elsewhere, and whether involving manual labour or not. The benefits of the Act should be extended to seamen in cases of accidents arising in home ports. As regards accidents occurring elsewhere than in home ports, the operations of the Act should be limited to those arising from defective equipment.

Your Committee do not consider it necessary under existing circumstances to amend the bills which have been referred to them, and have therefore agreed to report them without amendment.

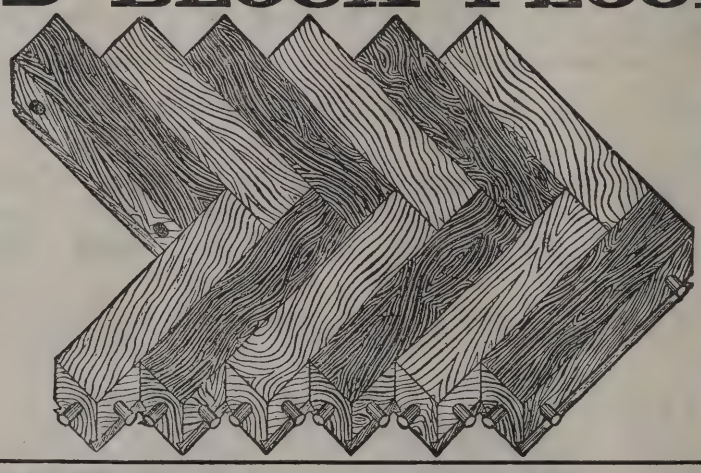
GERMAN COMPETITION ON THE CONTINENT.

THE report on the condition of trade in Spain, by Mr. Audley Gosling, which was issued last week by the Foreign Office, gives another instance of the efforts which are being made by Germany to monopolise the trade which at one time belonged to this country.

One of the most remarkable features in the commercial movement in this country during the last five years, he says, is the impetus given to the German export trade to Spain. As will be seen from the following figures, it has bounded from 2,052,752*l*. in 1881 to 3,547,169*l*. in 1884, and that in spite of universal depression of trade. Were reliable statistics forthcoming, the increase up to date (May 1886) would be equally suggestive of the German struggle for commercial supremacy in the Peninsula.

German Exports to Spain.

1881	£2,052,752
1882	3,309,661
1883	3,466,603
1884	3,547,169



Spanish Exports to Germany.

1881	£348,717
1882	283,865
1883	403,947
1884	302,634

Spanish economists are alarmed at the abnormal disproportion between the imports and exports, the latter falling short of the former by over nine-tenths. In 1865 the whole export and import trade with Prussia and the German States amounted to only 147,063*l*., so that in twenty years it has actually increased over twenty-six fold. There is said to be a growing anti-German feeling in Spain in respect to that country's too successful commercial competition in the Peninsula. The German commercial traveller is indefatigable throughout the Peninsula, and being well backed and supported, makes considerable headway against his English and French rivals.

Mr. Gosling is assured that a practice obtains, which, if true, is highly reprehensible. *A* enters a shop and asks for English goods. The shop assistant produces articles which *A* perceives are not of British manufacture, and, on saying so, the assistant points to the trade label written in English. A

THE IMPERIAL HAND GRENADE FIRE EXTINGUISHER.

Their Royal Highnesses the Prince and Princess of Wales and Suite witnessed a Practical Experiment in Fire Extinguishment at Norwich, during the Royal Agricultural Society Show, July 14, 1886.

"The fire extinguisher displayed in presence of the Royal party and a large company was the Imperial Hand Grenade, and the trial was conducted in a meadow next Trowse Church, under the direction of Mr. T. H. Tilton and Mr. Alfred Barnard (of Barnard, Bishop & Barnards, who are wholesale agents for the East of England). The experiments were a thorough success. A wooden chimney 14 feet in height was ignited, and the flames shot up quite 10 feet beyond; a large structure representing the section of a house and a smaller structure were also set on fire, and all were instantaneously extinguished by four grenades. The Prince and Princess both expressed their surprise and pleasure at the efficacy of this novelty in quickly putting out fire, and ordered that several might be sent on to Sandringham. The Royal party then moved off amid the cheers of the crowd."—*The Norfolk Chronicle and Norwich Gazette*, July 15, 1886.

BARNARD, BISHOP & BARNARDS,
WHOLESALE and RETAIL AGENTS, 91, 93 & 95 Queen Victoria St., E.C.; and Norwich.

case of this kind occurred recently to a gentleman, who protested that the goods were palpably of German make. The shopkeeper admitted that this was so, adding that the deception was practised to insure a ready sale at enhanced prices.

Now that a commercial *modus vivendi* has been arrived at between Great Britain and Spain, it is to be hoped that our trade with the Peninsula and the Colonies will be rapidly extended. A leaf might, however, be advantageously taken out of the books of German commercial travellers and agents in this country. Numbers of young men destined for business careers are sent over to Spain and placed in Spanish houses to learn the language and to study the tastes of the people—a task of easy accomplishment attainable with an ordinary share of intelligence within a twelvemonth. It stands to reason that a commercial traveller or agent enjoying these advantages is more than a match for one who can only recommend his wares through the medium of an interpreter or by the mere exposure of his price-list, and if we hope to fight Germany successfully on the field of commerce we must adopt her excellent and intelligible plan of educating foreign commercial agents.

At Malaga there is quite a German colony of young business men, who, after a year or two's residence there, return home well prepared for entering into the employ of firms having commercial relations with Spain.

THE NEWCASTLE JUBILEE EXHIBITION.

THE plans prepared by Mr. William Glover, vice-president of the Northern Architectural Association, and the architect for the Jubilee Exhibition at Newcastle, have been submitted to the Town Improvement Committee, and after explanation and commendation they were passed. It appears from the adopted plans that the main entrance in the North Court, to be constructed of three 50 feet spans, will be on the North Road, just beyond the end of the Bull Park wall. The height of the centre span will be 40 feet, and the two side spans will be 35 feet to the apex. The two side courts will each have a central avenue 50 feet wide and two side avenues 20 feet. The South Court will be similar, and the whole will thus form a square, enclosing an area of about 2¼ acres, which will be laid out as a garden and recreation ground, with a bandstand in the centre. At the four angles there will be refreshment buffets and dining-rooms, concert and art saloons will be placed south of the South Court. About three acres to the north of the exhibition buildings are reserved for mining operations and exposed exhibits, the grounds being connected with the ornamental lake. It is expected that the buildings will be in the hands of the contractors within a month. The date fixed for the opening is Her Majesty's birthday, May 24, 1887. The land occupied by the exhibition, mining operations, and exposed exhibits contains about 11 acres, and the covered area, including the main buildings, concert and art saloons, dining-rooms, offices, &c., will contain about 226,500 superficial feet. The reservoir at the south-west corner will be preserved for marine models, hydraulic, life-saving, and fire-extinguishing apparatus. The trees on the eastern boundary next the Bull Park wall will be preserved. In the North Court provision is made for a bandstand under cover.

SCOTTISH ARBORICULTURAL SOCIETY'S EXCURSION.

THE members of the Scottish Arboricultural Society lately undertook their annual excursion, the forests of the Marquis of Bute at Rothesay, and of the Duke of Argyll at Inverary, being selected for the occasion. The excursion occupied three days.

At Rothesay the party was met by Mr. Kay, wood manager on the Bute estates. After visiting the ruined castle of Rothesay, and measuring the old thorn tree near the chapel, the party drove to Mountstuart House, and spent the remainder of the day in inspecting the house policies and woods, and in taking measurements of the more remarkable trees. The grounds of Mountstuart have long enjoyed a reputation for great natural beauty, but they were a good deal devastated by storms in December 1883 and January 1884. On these occasions no fewer than 2,000 trees were blown down, and damage otherwise done which it will take a lifetime fully to repair. The bulk of the fallen timber, however, has now been removed, and already the signs of the wreck have been greatly covered over by a luxuriant crop of bracken. Among other trees which were measured, the tape being passed in all cases round the trunk at a height of 5 feet, were a Douglas fir, 5 feet 3 inches in circumference, and 63 feet high; a Menzies fir, 39½ feet high, and 2 feet 7½ inches in girth; a beech, 14 feet in girth, with a spread of branches of 66 feet; a cedar of Lebanon, 6 feet 11 inches in circumference, with a straight bole up to 25 feet; a Californian hemlock spruce, 48 feet high and 4 feet in girth; a Spanish chestnut, 8 feet 5 inches in girth; a *pinus insignus*, 3 feet

10 inches in girth; four Scots firs, from 8 feet to 8 feet 11 inches in girth. The trees seen were, perhaps, not so large as have been measured on other occasions, but one feature about them was the luxuriant way in which they were furnished with foliage. Several beautiful avenues of limes and beeches were traversed, and in the gardens the company was very much struck to see plants and shrubs growing in the open air which only do so in such climates as that of the South of France or Spain. One feature which gave great pleasure was to view the "nursery park," which was laid out from the Marquis of Bute's own designs in 1871, and is in its way a perfect picture.

On the following morning the members went by steamer to Inverary, where Mr. Wyllie represented the Duke of Argyll. The policies are very heavily timbered, many of the hard woods and firs alike being well-grown, handsome trees. A striking character of the trees on the lawn was their splendid foliage, which extended from the topmost to the very ground. Many of those examined could not have been less than 300 years old, and were of great height and girth. Some of the measurements obtained were considered worthy of special note. An old ash on the castle lawn girthed 15 feet 2 inches, a beech by the side of the river was 18 feet 6 inches in circumference, and upwards of 100 feet high, and a grand plane at the narrowest part of its bole gave 14 feet 5 inches. Oaks and Spanish chestnuts so heavy as those examined are not often seen in so great abundance on this side of the border. Out of quite a large number of oaks around which the tape was passed, one measured 12 feet 11 inches in circumference, another 12 feet, a third 11 feet 7 inches; while of the Spanish chestnuts, one was 17 feet 8½ inches in girth, a second, near the farm offices, measured 19 feet 9 inches. The stem of this tree was twisted like a rope and not a few of its gnarled boughs were covered with the hard fern. The soil, especially on the slopes of Dun, seems particularly well suited to the growth of coniferous trees, the woods in that respect recalling to mind some of the best timber districts of Perthshire. There is a tradition that the Scots firs on Inverary were planted by Atholl men, and it can be said for them that they do credit to themselves and to the estate. They are of the genuine Scottish family, with grand, scaly bark, and they have grown to a great size. One of the largest which was measured was 13 feet in girth and 116 feet high, and there were many others little inferior in bulk. A larch which was taped was 10 feet 5 inches in girth and 136 feet high, the height in all cases being determined by dendrometer measurement. A great many magnificent silver firs were met with on Duniquaich. One of these turned out to be the talles tree measured. Its height was 144 feet, and its girth 13 feet 8 inches. One adjoining was 15 feet 3 inches in circumference, but not quite so high. The spruces in the same locality were growing splendidly. One, which was planted fifty years ago, is now 80 feet in height, and girths 8 feet 4 inches.

The third day's excursion was devoted to the woods along the northern shore at Inverary. Taking their way by the famous beech avenue which opens into the town, several trees were there taped. One of the beeches girthed 18 feet 6 inches, and there were not a few not far short of that measurement. The avenue has suffered a good deal of late by violent storms; but it was noted with satisfaction that the gaps were nearly all filled up with the same kind of trees. In the Kilbride, Clonary, and Barrvrack woods the company had frequent occasion to admire the great size and quality of the silver firs, growing for the most part on the hillsides upon rocky soil. One of these is quite a historical tree, having been planted by the present duke's grandfather, who commanded the Argyleshire Highlanders at Culloden. It is now a grand tree, running up 45 or 50 feet as straight as an arrow before "forking," and girthing at 5 feet up 16 feet 4 inches. Mr. Kay's dendrometer was tried upon it, and gave it a height of 121 feet. Another great silver (in the Barrvrack wood) girthed 16 feet 10 inches, had a height of 134½ feet, and by the usual calculations was estimated to contain 750 feet of serviceable timber. Among other trees around which the tape was passed in the course of the drive was what is known as the marriage tree, in the avenue, where a curious ingraft between two great limbs of a beech has taken place. At the narrowest part of the bole the girth was 15 feet 4 inches, and at 5 feet up it was 16 feet 2 inches. A very fine plane was also measured, it being, however, less remarkable for its size than for its beautiful head. Its girth, however, was by no means contemptible, the measurement giving 12 feet 8 inches. A remarkably fine lot of oaks and Scots firs were also met with on the journey, which included a visit to an old Roman bridge on the Douglas water still in a remarkably good state of preservation. In returning to town an opportunity was given to the party by Mr. Stewart, the forester, to see a number of his young mixed plantations. By violent gales within the past few years the Inverary woods, which extend to about 4,000 acres, suffered very severely. Most of the blown timber has been removed, and to supply the gaps made, a good deal of Douglas fir—which seems to thrive here remarkably well—has been planted out.

MANUFACTURERS OF PATENT
METAL CASEMENTS
AND
LEADED WINDOWS.
Our Patent Steel "SIMPLEX" Casements have the following advantages over any other Casements in the market:—
They are thoroughly weathertight.
They can be made to open inwards or outwards, hung at the sides, or head, or sill, and in all cases the PLANE OF GLASS and the SIGHT LINE are the same.
They will not SAG, or TWIST, or JAM.
The Glass being secured by metal fillets the ragged appearance of putty is avoided.
The face being moulded has a more pleasing appearance than the ordinary uncouth finish.
By the use of these Casements all difficulties of window-cleaning are overcome.
The Patent "Cottage" Casement is made for such positions where plane of glass and thorough weathertightness are not absolute requisites, and where the extent of finish is not necessary.
Prices and particulars will be gladly furnished on receipt of inquiry.

VOLUME XXXV. OF THE ARCHITECT.
handsomely bound in Cloth, Gilt Lettered, price 12s. 6d.
Office 175 Strand, London, W.C.

THE MANCHESTER EXHIBITION OF 1877.

It was announced last week in *The Architect* that the design by Messrs. Maxwell & Tuke, of 29 Princess Street, Manchester, had been selected by the Council of Guarantors for the Jubilee Exhibition which is to be held next year. The remaining prizemen were Messrs. Salomons & Ely, Mr. Alfred Darbyshire, and Messrs. Pennington & Bridgen.

The new exhibition building is divided into five sections. The general plan of the main building consists of a lofty nave and transepts arranged in the form of a Latin cross, with low buildings supporting it on each side. These low buildings or courts are each 30 feet wide, and this division has been preferred above the usually greater width, as it allows in each court side exhibits and a central gangway. In the art portions of the buildings this method of spacing is of manifest advantage. Section No. 2 (machinery in motion and processes) is divided into three sub-sections—one for motive power, electrical machines, and machinery in motion of a hazardous description; one for machinery in motion not hazardous; and the south-west angle (separated from the rest by the nave), for processes not requiring power and not hazardous. The floors of two of these sub-sections in the north-west angle are 4 feet 6 inches below the level of the rest of the floors. Section No. 4 occupies the portions comprising "Old Manchester and Salford," and is partly used as a screen, so that the whole of the front towards the Botanical Gardens will be faced with ancient buildings representing portions of "Old Manchester and Salford" or historic buildings in the neighbourhood. Section 6 (fine arts) is separated from the rest of the building by fireproof screens. The doorways are deeply recessed to prevent the spread of fire. In Section 7 is a music-room, 150 feet by 100 feet, divided from the rest of the building with fireproof screens. This hall is accessible from the gardens or from the central nave. In addition to this room the architects provide a band gallery at the end of the north transept, so arranged with movable shutters that the band can be heard either in the building or in the gardens. The refreshment department is said to be very ample, and has been arranged with special reference to the public convenience and its facilities for service and kitchen accommodation. The gallery of approach from Chester Road will be filled with statuary, interspersed with shrubs and flowers, so as to form a striking *coup d'œil* upon entering. The entrance from Talbot Road is marked by a carriage porch, the whole width of the street. The old 60 feet gallery, it is added, will in all probability be retained after the exhibition as a permanent exhibition, and for this purpose the designers propose to encase it almost entirely with glass. The purlins would need a little strengthening, but otherwise the building was in their opinion strong enough for its purpose. The curved portion of the top would be covered with corrugated iron bent to the sweep. Considering the valuable collection that would be housed within the building, and the enormous charges made for insurance, which in this case would for building and contents, if fully covered, amount at least to 4,000*l.*, they had used nothing inflammable in the building except the windows, the skylights, and the outside cornice and the doors. Always bearing the above consideration in mind, and after a careful study of the strongest materials and searching calculations as to the first cost, the ease and economy of erection, the value of the materials if broken up and resold, and the value of the building if sold for re-erection, they had decided to recommend the use of gas or water pipes as the material of which to construct the framework of the building. The Corporation of Manchester used every year an enormous quantity of gas-tubing of the sizes specified, and as this tubing would be improved by the coat of paint it would receive in the building, the cost of the building by its use would be greatly reduced—(*a*) by the resale value of the materials, and (*b*) the ease with which the same could be constructed and taken down. According to the plan, the whole of the framework of the building, except the roof of the nave and the dome, would be constructed either of cast or wrought tubes, including the pillars, principals, and purlins. The architects furnish details showing the method of construction, and state that these, if taken in conjunction, more fully explain themselves than anything that could be said in a written report. The gutters throughout are strong cast iron, sufficiently capacious to carry off the water of the heaviest floods. The portions of the roof and sides where glass will be glazed with one-eighth rolled sheet, without putty. The rest of the roofs will be covered with corrugated sheet iron. All divisions in the building where not shown brick will be made with Johnson's patent wire and plaster studding. The outer casing to the building where not glass will also be made of this material, but the exposed surface will be cemented. The question of a fireproof floor being of paramount importance, it is proposed to use cement slabs 4 inches thick. With regard to protection from fire, the architects state that that question has been para-

REGENERATIVE GAS LAMPS
(WENHAM'S PATENTS).

Whereas it has recently come to the notice of the WENHAM COMPANY, Limited, Sole Proprietors of the above Patents, that REGENERATIVE GAS LAMPS are being manufactured and offered for Sale in infringement of the above Patents: Notice is hereby given that Legal Proceedings will, without further notice, be taken against all Persons manufacturing, selling, or using REGENERATIVE GAS LAMPS so made in infringement of the said Patents.

April 20, 1886. J. HENRY JOHNSON, 47 Lincoln's Inn Fields, W.C., Solicitor.

mount with them, and not only have they designed the use of fireproof materials wherever the cost would permit, but have so divided and separated the buildings that the risk of fire has been reduced to a minimum. The central portion of the building has been divided by four 14-inch brick walls from the sections on either side, so as to prevent a spread of fire. A fire occurring in one of the art galleries, for instance, could not possibly spread to another gallery or to the main building. They recommend, in addition to these and other precautions, that wire curtains be hung between the brick walls below the door to within 7 feet of the floor, and that these should be dropped down to the floor after the exhibition closes at night. On the subject of reduction of loss by resale, the architects state that the framework of the building being made of iron tubes, nothing but the special couplings would be waste or scrap. Looking at the building's capacity for sale or re-erection, the nave would form an excellent workshop, or it could be sold in sections. In the provisional committee's report reference was made to the cost per yard of the exhibitions at Liverpool and Edinburgh, which they feared might prove a little misleading. In Liverpool the building, although largely of iron, was a second-hand erection, and they believed that a large amount had been spent on the foundations which did not appear in the cost of 17*s.* per yard. In Edinburgh the cost in the authorised catalogue was given at 22*s.* 7*d.* per yard, and not at 16*s.* per yard. While it was true this cost included the area of and expenditure upon the permanent building, it was to be considered that the whole of their nave, transepts, and dome were built in as solid a manner as the most permanent portion of the Edinburgh building. The framework of the proposed building would be constructed of iron throughout, and the floor would be of solid concrete. The schedule of areas and prices per yard—pillars of cast iron, and all other ironwork of wrought iron—shows a total of 37,305 superficial yards, at an average cost per yard of 17*s.* 6*d.*, making 32,653*l.* 14*s.*, which is given as the amount of the estimated cost of buildings, exclusive of "Old Manchester and Salford."

The architects, in dealing with the subject of the valuation of the building at the close of the exhibition, state that it is of course always possible that the building or portions of it might be sold for re-erection as workshops, railway stations, or warehouses; but they consider that the only safe way is to anticipate waste and to estimate the resale at breaking-up prices. They consider that it should realise 50 per cent. on the original cost.

PROPOSED FEVER HOSPITAL AT HANWELL.

AT the monthly meeting of the managers of the Central London School District, held on Monday last, tenders received for the proposed alterations and additions to the probationary ward at Hanwell, with a view of converting it into a hospital for infectious cases, and the formation of a new laundry, were opened. Mr. E. Clarke, chairman of the Board, presided, and there was a full attendance of managers. The contract (terms of which were recently advertised in the columns of *The Architect*) was divided into two parts, the first being to provide the alterations and additions specified in the plans prepared by Mr. Langdon, the architect, and the second for plastering the same.

Mr. Mann said, prior to the tenders being opened, he should like to know in what papers the advertisements inviting them had been inserted.

The clerk (Mr. G. E. East) replied *The Architect*, the *Builder*, *Building News*, the *Standard*, and a local newspaper published in the vicinity of Hanwell.

Mr. Parrett moved that the tenders be referred to the special committee for examination, with the plans and specification, and that they should report to the managers at their next meeting.

The Chairman thought they did not want any consideration, as the specification had been thoroughly gone into by the committee. The unfortunate part of the matter was that they had not got sufficient money to carry out the work.

Mr. Mann had been rather taken aback by the large amounts of the tenders. They could buy the land and the mansion for the money, and to expend so large a sum was a serious matter for the ratepayers.

In reply to a question, the Chairman said the surveyor's estimate for the whole of the work was 2,200*l.*

Mr. Tattersall agreed with a previous speaker that the whole matter should be sent back to the committee for reconsideration.

Mr. Parrett did not want to delay the work, but thought the house committee should make a further investigation into the entire subject.

The Chairman pointed out that the matter had already been thoroughly considered and decided upon, and the drawings had been submitted to the committee in every way.

Mr. Hart said the tenders were before them, and must be disposed of at once.

SPECIFICATIONS AND PRICES ON APPLICATION. ORDERS BY POST PROMPTLY ATTENDED TO.

BRYANT, POWIS & BRYANT LIMITED,

Mr. Parrett: But we do not know what the tenders are for.

The Chairman: You attended the committees, who took a great deal of trouble in going through the drawings and plans, which were approved.

Mr. Tattersall argued that there were a few infectious cases existing, perhaps three or four, but sometimes there were none. To expend 3,000*l.* in altering their probationary wards was absurd, although that would be preferable to laying out 6,000*l.* or 7,000*l.* in the erection of a new hospital. He moved that none of the tenders be accepted, but that they be referred to a committee to see if some other arrangement could not be made. He did not see that because the plans had been gone into and approved the Board was, therefore, necessarily tied to them.

The Chairman said the work had to be done, and they had received the assent of the Local Government Board. They had, moreover, borrowed money for the purpose, and he did not see how they could help themselves.

Mr. Mann rejoined that they were still in this difficulty—they had not borrowed enough money. [The Chairman: We shall have to get more.] They had been misled by the approximate estimate of their architect; and, having already waited three years, they could wait until next spring. He hoped this Board would not receive the tenders, for he was astonished that this large expenditure had been forced upon the ratepayers.

Mr. Hart had always been of opinion that there was no necessity for this infectious hospital, but now they had invited and received twenty tenders, one of which was as low as 2,700*l.*, he did not see how they could abandon the matter. The only reason why he voted for the alterations was from what their medical officer said. To reject the tenders seemed to be a very wretched conclusion to come to after waiting three years.

Mr. Colegrave remarked that the Local Government Board had urged the provision of this hospital for many years.

Mr. Day did not know whether it was possible to eliminate anything from these tenders, and so to effect a reduction in the prices quoted. Estimates given by architects were seldom below the mark. He thought it would be a good plan for these tenders to go back to the committee, to see whether the prices could be reduced.

The Chairman did not think he could put the motion that the tenders should be sent back to the committee. It would stultify all that they had done.

Mr. Colegrave seconded Mr. Day's amendment.

Mr. Hawkins moved that the matter be adjourned for two months, and that in the meantime the house committee consider the whole question with the architect, with a view to seeing what reductions could be made.

Mr. Hart: Then we shall have to advertise for new tenders.

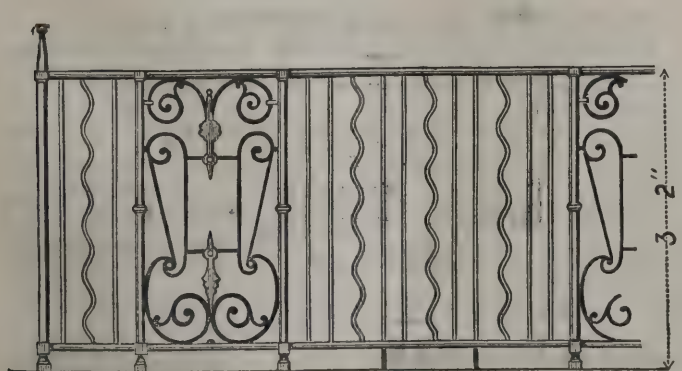
The Chairman: You would then have to put it off until next year.

Mr. Tattersall: And a good job, too.

The Chairman: Better leave it to the new Board, which will be appointed in two months' time.

Mr. Wagstaff seconded Mr. Hawkins's amendment, which, after an animated though desultory conversation, was ultimately carried, so that the matter stands adjourned for two months.

THE MESSINA TUNNEL.



THERE appears to be a great probability that the proposed tunnel under the Straits of Messina will be constructed, the Italian Minister of Public Works having instructed the engineer, Carlo Navone, to carry on investigations on the basis of the plans prepared by the engineer Gabelli. The latter brought the subject before the Italian Parliament as early as 1879, and in 1882 he delivered a lecture at Rome, in which he dwelt upon the necessity of joining the railways of Sicily and Southern Italy both for commercial and military reasons, and demonstrated the practicability of the undertaking from a scientific point of view. According to Professor Seguenza, of Messina, a geologist, the formation of the strata under the straits is favourable to the construction of a tunnel. Its cost is estimated by Gabelli at 2,840,000*l.*, and the time of construction at from four and a half to six and a half years. The tunnel would have to be made about 500 feet below the level of the sea, this depth to be reached by spiral approaches from the land ends. Its total length would be about eight and a half miles. There is an alternative proposal for joining the island of Sicily with the Italian mainland by means of a bridge thrown across the Straits of Messina, which is about eight miles wide at its narrowest part. Whichever scheme is adopted, there seems to be no doubt that the closer connection of the island with Italy is much wanted. Sicily has made great economical progress since its union with the Italian kingdom, its several railways having now reached a length of over five hundred miles, while its population, according to the last census, is about three millions.

BRADSHAW'S LIMMER ASPHALTE

Messrs. BRADSHAW & CO., being Sole Agents in the United Kingdom for, and possessing proprietary rights in, the Freehold Mines of the German Asphalte Company (of which Mr. C. W. Bradshaw is also a Director), situated at Limmer, near Hanover, and Vorwohle, Brunswick, possess special facilities for reliable and prompt delivery of their celebrated "LIMMER ASPHALTE" at low rates, either for sale in its natural state or ready for laying by their own workmen in any part of the United Kingdom. EACH BLOCK supplied from these Mines, besides bearing the impress of the Company, is stamped with the words "BRADSHAW & CO." The attention of Architects, Engineers, &c., is particularly called to the fact that the "LIMMER ASPHALTE" is especially suitable for use in the construction of Reservoirs, Roofs, &c., where water-tightness is extremely essential. For such purposes **Over 2,000,000 (Two Millions) of Square Feet of "Limmer Asphalte"** have been executed by Messrs. BRADSHAW & CO.; while for Paving purposes **Over 50 Miles of "Limmer Asphalte" Footways** have been laid by them in the LONDON DISTRICT ALONE. Messrs. BRADSHAW & CO. will be happy to forward Prices, Samples, and Testimonials, and give all information on application to:—

R. ADAMS,

17 BLACKMAN STREET & 7 GREAT DOVER STREET, LONDON, S.E.,

INVENTOR and PATENTEE of the

SAFETY WINDOW WITH REVERSIBLE SASHES

FOR INEXPENSIVE AND PERPETUAL CLEANLINESS,

Which has gained at the INTERNATIONAL HEALTH and SANITARY EXHIBITIONS

Two Gold, Four Silver, and Four Bronze Medals, and Sixteen Diplomas of Merit.

IMPORTANT NOTICE.

The Patentee has been advised by several of his friends to form a Company for the Manufacture of the above-mentioned Sashes in larger numbers, for the supply of the Trade and for the Home, Colonial, and Foreign Markets. Hitherto he has only supplied the Fittings, except under very special circumstances. He now proposes to manufacture the Sashes complete with Fittings.

Provisional Protection has just been granted for another Patent, whereby the Sashes will be greatly reduced in price, and, consequently, brought within the requirements of every Architect and Builder.

If any of the readers of this journal wish to receive further particulars or to take Shares in the proposed Company, they are requested to make early application to the Patentee, as it is expected that the larger number of the Shares will be privately subscribed.

Applications for Shares will be taken in the order in which they are received.

BRADFORD.

GRUNDY'S PATENT
WARM-AIR
VENTILATING FIRE GRATE.
The novelty, superiority, and advantage of this patent consist in the heating surface being greater than any other Fire-grate introduced to the public. It is very simple in construction, and is made in the form of a Stove, the back of which is semicircular in shape, with gills behind and smoke-nozzle on top, all cast in one piece. The same can be attached to any design of a Register or Stove front. It is very suitable for schools, class-rooms, waiting-rooms, hospitals, offices, dormitories, and dwelling-houses, from the cottage to the mansion. Design and specification post free on application.
TESTIMONIALS.
"9 Victoria Chambers, Westminster, S.W.: June 10, 1884.
"SIR,—I have much pleasure in testifying to the efficiency of your patent warm-air fire grate. It has been very successful, and given every satisfaction where I have used it. Yours, &c.,
"To Mr. Grundy. JAMES WEIR, F.R.I.B.A."
"6 John Street, Bedford Row, W.C.:
"December 16, 1885.
"DEAR SIR,—I have now had an opportunity of testing your patent grate, and am glad to be able to say that I am most agreeably disappointed, because, as you are aware, I was rather sceptical about its powers when you showed it to me; but now I can say it answers admirably, and heats abundantly my porch-conservatory.—I am, yours truly,
"R. S. LANDER, F.R.I.B.A.
"To Mr. John Grundy."
From James Garry, Esq., Architect, West Hartlepool, July 1884.
"DEAR SIR,—I have very great pleasure in stating that the first stove, or patent warm-air ventilating fire grate, adopted by me in school at Seaton, and a second in a Cocoa Palace, have given such satisfaction that I now order eleven to be inserted in New Upper Grade Schools in course of erection at West Hartlepool. They are the most economical, efficient, and easily managed stove at present before the public.—Mr. John Grundy."
From Hon. and Rev. G. G. C. Talbot, M.A., Withington, Cheltenham.
"DEAR SIR,—You will be gratified to hear that the school is completely warmed by your new grate. It is the most economical and efficient that I have ever seen.—Mr. John Grundy."
Society of Architects, Architectural and Building Trades Exhibition, 1885:—"5 Great James Street, Bedford Row, May 1.—The warm-air ventilating grate shown by Mr. John Grundy at Stand 75 Floral Hall, is an admirable contrivance for utilising the heat conducted through the back and sides of the stove, for warming schools and buildings by a supply of freshly warmed external air."
Apply to JOHN GRUNDY, 30 Duncan Terrace, City Road, London.—Works: TYLDESLEY, near Manchester.
Agent for Scotland, SEPTIMUS HARPUR SMITH, 1 Upper Gilmore Place, Edinburgh.

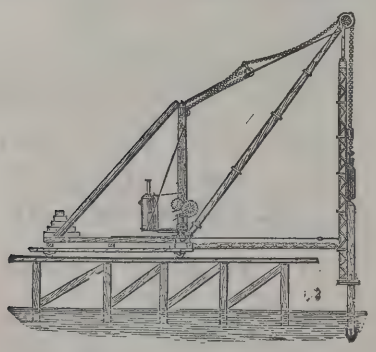
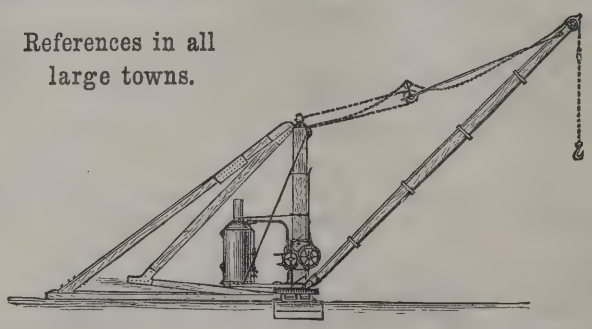
TRADE NOTES.



A VERY large mosaic picture, representing *The Last Supper*, after Leonardo da Vinci, has been put up by Messrs. Dr. Salviati & Co., of Regent Street, in St. Bridget's Church, Wavertree, Liverpool. It is said to be the largest representation of the Last Supper ever done in mosaic, measuring 17½ feet long and 9½ feet wide.

MR. MATTHEW T. SHAW, of Cannon Street, died suddenly on the 14th inst. The business of the iron trade will continue to be carried on by the remaining partners—Mr. Harry T. Shaw and Mr. Charles Chittick.

THE Æolus Waterspray General Ventilating and Electrical Engineering Company, 235 High Holborn, have received instructions to apply their complete system of heating, cooling, and ventilating to the library and reading-room of the Four Courts, Dublin.



COOKING by gas is now daily becoming more frequently adopted. At the present low price of gas it is even more economical than coal, which has the great disadvantage of causing dirt, dust, and smoke, whilst gas is cleanly, at all times ready for use, and always under control; the heat is more rapid and more uniform. Mr. Leoni, of the Adamas Works, Islington, is justly acknowledged to be the pioneer of scientific gas-cooking apparata. He fitted up the kitchens of the London Hospital more than a year ago, where they cook daily for upwards of 1,000 persons. The results have proved so satisfactory that a testimonial has been sent by the chairman, Sir Edmund Hay Currie, testifying to the merits of Leoni's

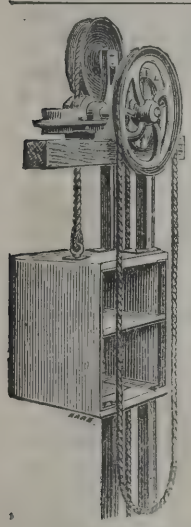
R. HOWARD,
Horticultural Works,
DONCASTER.

HORTICULTURAL BUILDINGS erected, with hot-water apparatus complete, in any part of the Kingdom, by experienced workmen. All the newest improvements in machinery for ventilation.

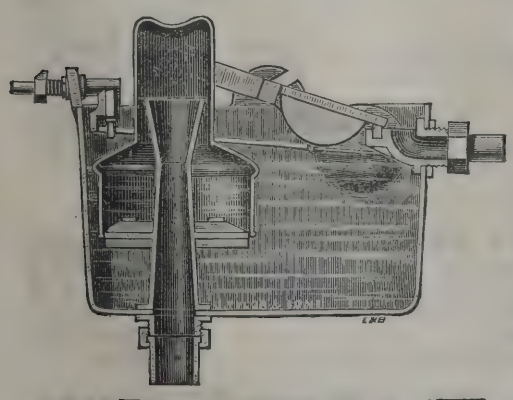
SILVER MEDAL awarded by the Society of Architects at the Architectural and Building Trades Exhibition, Sheffield, February 1886.

Also PRIZE MEDAL and CERTIFICATE, the highest and only award for excellency of Horticultural Buildings and Machinery for Ventilation, at the International Architectural Trades Exhibition, London April 1886.



apparatus. The cost of gas consumed is only about 7*s.* per day, and the saving in meat in consequence of the reduced waste during cooking is proportionately great. Mr. Leoni has also fitted up an apparatus for Mr. Whiteley, of Westbourne Grove, to cook by gas and steam for 3,000 persons daily, and received a testimonial stating the saving per annum to be over 800*l.* Mr. Leoni has received favourable testimonials from Guy's Hospital, St. Luke's Hospital, Darenth Asylum, Poplar and Stepney Sick Asylum, Lambeth Infirmary, Paddington Infirmary, St. Saviour's Union, and numerous hospitals, infirmaries, &c., throughout Great Britain and on the Continent, as well as from several of the most important hotels, restaurants, and clubs, and from many of the Government and public offices. We have great pleasure in bringing before our readers so much useful work by one man, who must be well known to many of the most distinguished members of the profession who recommended him on important occasions, and who have seen his manufactures at the various exhibitions, where he generally carries the highest awards. Mr. Leoni has received gold or silver medals from upwards of thirty exhibitions in Europe and America.

NOTES ON NOVELTIES.



A GREAT improvement on the ordinary method of wood-planing machinery has been introduced to the trade by Mr. John Rawlings, of Hackney Road, London. It is called the spiral cutter, and in a treatise on the subject Mr. Rawlings tersely describes its advantages. After attributing to the straight blade in general use the inability to plane smoothly on account of the "simultaneous chop" peculiar to it, which makes the work uneven and unfinished, he says, "The spiral cutter is designed to obviate the foregoing difficulties. It cuts only a small portion of the wood, but is cutting that small portion continuously during the whole revolution of the blade. It cuts at an angle of twenty-two and a half degrees, and gently drawing into its work takes off the finest shaving, shearing a small portion from side to side of the work. When a blade has worked to 7½ inches from one side of the wood another blade commences cutting, so that, with a 30-inch cutter, all the blades will be working at the same time, and that continuously, working smoothly and evenly, and causing no vibration or shock whatever to the work or the cutter." These are the essential advantages claimed by the patentee, which we insert because they seem to us correct. We attended a test given at Mr. Rawlings's establishment in the Hackney Road, with most satisfactory results. The patentee has had the enterprise to fit up two machines—a hand-feed surfacer and a roller-feed thicknesser—in a commodious building, surrounded with various specimens of wood for use in the tests, and a visitor can see any piece planed. Some of the roughest possible wood was put in the machine, and came out perfectly smooth and unchipped. The knots were made as smooth as any other part of the wood, and in figured specimens the level method brought out the figuring admirably; indeed, the work is in a finished condition and ready for use after leaving the machine, thus dispensing with the usual amount of extra hand labour. We saw several difficult specimens that had been passed through the machines and polished direct from the planers, without any other preparation whatever, the surfaces appearing equal, if not superior, to carefully prepared hand-work. The spiral cutter is fed at about the rate of 15 feet per minute, a rate that is kept up without any stoppages. There is a receptacle for the

shavings in the shape of a pillar-box, thus preventing impediment to the working of the machine. The spiral cutter is peculiarly adapted for resisting strain, each blade being *drawn* diagonally through the cut. The four blades are twisted completely round the cutter shaft, and are bolted on all sides to it, thus firmly guarding against the blade being thrown, as is not unusual in ordinary machines running at a high speed. Mr. Rawlings claims that "cutting at an angle is the only scientific mode of cutting wood, and that this particular treatment is more adapted to the planing of valuable woods requiring special attention." The difficulty of grinding the blades has been met by the patentee with a grinding machine, called the "Spiral Grinder." This is made either on a separate stand for grinding any number of machines, spiral or otherwise, and the other is erected on the top of the planer, there to grind the blades in position. The grinder consists of an emery wheel mounted on a swing carriage, which works with mechanical accuracy, and, from an inspection, we can say that it answers the purpose admirably. There is no doubt that it is only a matter of

20 BUCKLERSBURY, E.C.
ULVERSTON, LANCASHIRE.

BEAN'S PATENT DIRECT-ACTING VALVELESS WASTE-PREVENTING CISTERNS.
These Waste-Preventers are simple in construction and rapid and powerful in action. The working parts have been improved and are well balanced. The arrangements for charging the siphon are such that a slight pull by hand is all that is necessary to cause the immediate and automatic discharge of the contents of the Cistern.
THE CHIEF ADVANTAGES are—(1) the direct-acting method of charging the siphon, by which the full flush is obtained at once; (2) simplicity of construction; (3) no valve in the bottom of the cistern to cause leakage; (4) no tight-fitting parts to corrode or get out of order; (5) no waste incurred by fastening the "pull"; (6) insures a rapid and regulated flush without holding down the pull.
PRICES AND PARTICULARS ON APPLICATION.

time for this improvement in wood-cutting to become generally adopted, for it is based on doing work better, easier, and cheaper than heretofore.

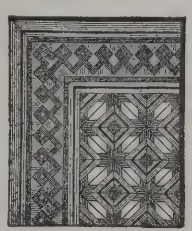
A Patent Interchangeable Rubber Tread.—A long-felt want in this direction has just been brought out on the market by Messrs. Hendrad Gooding, of North Road, Holloway. The special feature of this patent tread is that it consists of a metallic keeper, fitted with pieces of india-rubber or other material, which project above the metal and form the wearing surface, affording a safe footing under all circumstances and in all weathers. They can be adapted to any staircase, iron, stone, or wood, spiral or otherwise, and are especially of advantage for gangways and bridges of vessels, invaluable for entrances to railway and other carriages, and station steps, &c. Hitherto in entrances to places where there is continual foot-traffic one could perceive the centre of the steps worn away, even to the hardest material, such as stone, concrete, &c. By this invention, which is cheap and durable, one at the onset can apply these treads, and having seen the set that are fixed to one of the cars of the London Street Tramway Co. running from Euston Road to the Archway Tavern, Highgate, we can safely say that they are of the utmost utility. In the case of iron staircases, a plate is simply screwed down and a tread inserted in the groove, being easy to change at will. The idea is a good one, and we can safely say that if they are once used they will continue to be in great demand.

A Simple Cure for Smoky Chimneys.—His Grace the Duke of Northumberland recently consulted with Messrs. Verity Bros., of Regent Works, Regent Street, London, relative to the smoke proceeding from the chimneys of the laundry portion of the domestic offices at his residence, at Syon House, Isleworth. This portion of the premises is situate against the main building, but being of a lower elevation, the smoke from the chimneys in question (which is of great volume, comprising, as it does, the combined products from two boilers, a steam-engine, a large ironing stove) was, with certain winds, directed against the windows of the chief apartments, and also seriously interfered with clothes drying, carried on immediately around. The difficulty was to get rid of this smoke without attaching any appliance that would deteriorate from the architectural aspect of the mansion. The problem was overcome in the following manner:—To the offending chimneys were fitted a syphon, which was continued with a 15-inch galvanised iron tube down the side of the building, where it was connected to the drains. By the aid of two of the patent annular water-spray jets (manufactured by this firm) fixed, one near the syphon and the other some distance below, they were enabled to direct the smoke down this shaft, and by the action of the water-spray, to precipitate all the floating particles of soot, leaving only the lighter portions of the smoke to be disposed of. This courses along the main drain, and what remains is finally extracted by one of Messrs. Verity's 24-inch patent exhaust heads (worked by a fine jet of water) placed at the outfall of the sewer, which is a quarter of a mile from the house. It will be noted that this continuous passage of smoke through the drains has a deodorising effect on the sewage matter contained in them. The drain under consideration was very large for the purpose of a private mansion, being 3 feet by 2 feet 4 inches, and, as this depends upon the storm water alone for flushing, it was more or less charged with matter; but since this novel system has been in action a noticeable improvement in the absence of sewer-gas is acknowledged, owing also, doubtless, to the increased ventilation. This method of treating nuisances of this character is, therefore, a practical one, and at the same time affords a means for the continuous deodorising of sewers. We may remark that the entire arrangement is self-acting, is not liable to get out of order, and a very important item is that it does not require the slightest attention when once fixed.

EXAMINATION QUESTIONS IN GENERAL CONSTRUCTION.

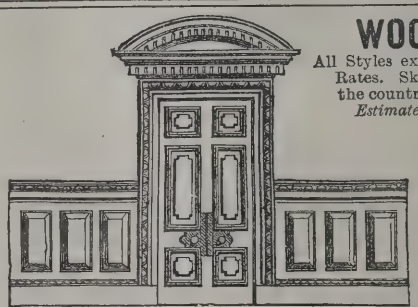
THE following is a copy of the last examination paper given to candidates who are desirous of employment in the constructive departments of the Municipality of New York:—

N.B. In case candidate does not remember formula or method of solving any problem submitted to him, let him name any work upon the subject where such formula or method may be found.



1. What is Civil Engineering?

2. Have you ever pursued a course of study in any educational institution, or with any civil engineer, which would fit you for the position of assistant engineer? If so, state when and with whom; state also, in detail, what experience you have had.



3. Have you ever had responsible charge of any public work? If so, state particulars.

VOLUME XXXV. OF THE ARCHITECT.
Handsomely bound in Cloth Gilt Lettered. Price 12*s.* 6*d.*—Office: 175 Strand, London, W.C.

4. Solve the following according to the algebraic signs :—

$$\sqrt{\frac{(6\frac{2}{7}-4\frac{5}{9})\times 8\frac{7}{16}}{4\frac{4}{12}}} \times 67873{\cdot}367,$$ and show your work.

5. The population of a certain town in 1880 was 7,095 ; it having increased 25 per cent. in ten years, what was it in 1870? Show your work.

6. How many feet, board measure, in the flooring of a room 20 feet by 30 feet and 2½ inches thick?

7. Find value of x and y in the following equations :—

$$2x+3y=33$$
$$4x-y=17.$$

8. Find value of x in equation $x^2-x-40=170$?

9. Find value of x in equation $\frac{a}{b}+\sqrt{\frac{a^2-x^2}{x^2}}=\frac{x}{b}$.

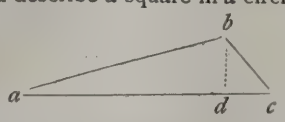
10. Explain the meaning of the expression $a\frac{1}{2}\times b\frac{3}{4}$.

11. What is a logarithm?

12. What is the base of the common system?

13. In making what calculations are logarithms useful?

14. How do you find the logarithm of a number in a table of logarithms?



15. What are similar triangles?

16. How are similar triangles proportioned to each other?

17. The sides of a polygon being prolonged, what is the sum of all the exterior angles equal to?

18. How do you pass the circumference of a circle through three given points not in the same straight line?

19. How do you describe a square in a circle?

20. In the triangle b being a right angle, what proportion does $d\,b$ bear to $a\,d$ and $d\,c$?

21. How do you inscribe a regular hexagon in a circle?

22. What proportion do circumference and areas of circles bear to their radii?

23. How do you find the area of a regular polygon? 24. Of an irregular polygon? 25. Of a circle? 26. How do you find the solid contents of a cylinder? 27. Of a wedge? 28. Of a pyramid?

29. Find the contents of the wedge, base 20 feet by 30 feet, height 10 feet, edge 15 feet.

30. State the prismoidal formula; would you use it in calculating earthwork?

31. Is a simple question in calculating areas.—Ed. *Eng. News.*

32. How many and what parts of a plane triangle must be given to find the rest?

33. Define the terms sine, co-sine, tangent and co-tangent.

34. What are natural sines, co-sines, &c.?

35. What is a table of logarithmic sines, co-sines, &c.?

36. Two sides and two angles of a plane triangle being given, how do you find the other parts?

37. When two sides of a plane triangle and their included angles are given, how do you find the other parts?

38. In the right-angled triangle $A\,B\,H$ express algebraically the value of the sine, co-sine, tangent, and co-tangent of angle A in terms of a, b and h, they being the altitude, base and hypothenuse of the triangle?

39. What is the law of gravitation?

40. Do you understand that there is any difference in the meaning of the terms gravitation and gravity?

41. What is the law of falling bodies?

42. Express algebraically this law, taking v = velocity of falling body ; g = acceleration of gravity ; and h = height.

43. What is the centre of gravity of a body?

44. How is it found?

45. Where is the centre of gravity of a homogeneous body whose sides are all rectangles?

46. What is the specific gravity of a body?

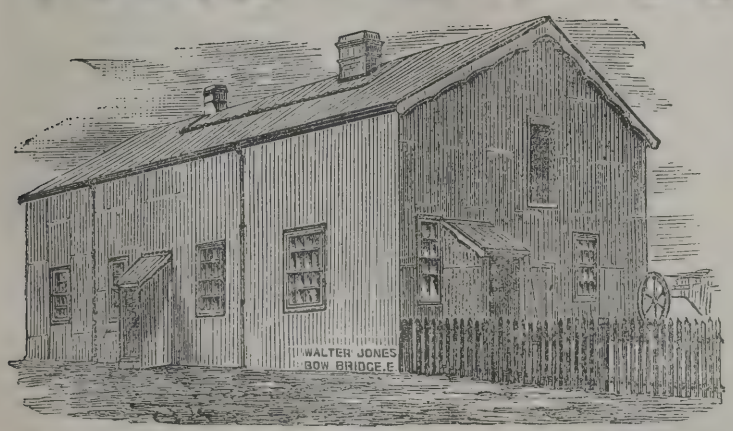
47. What is the standard for solids and liquids?

48. What for gases?

49. What laws govern the pressure of liquids at rest?

50. How do you find the number of gallons of water to the cubic foot?

51. What is the weight of a gallon of water?



52. What is the pressure per square inch on the side of a vessel at the depth of 10 feet below the surface of the water?

53. What will be the theoretical volume of discharge per second from a reservoir through a pipe 1 foot in diameter discharging at a depth of 100 feet below the surface of the water?

54. How many gallons of water will be discharged through a pipe 1 foot in diameter, 328 feet long, head 13½ feet, coefficient of flow = ·007?

55. State how many men are needed to make up a full party for a survey of a preliminary line or location of a public work, such as a railroad or aqueduct.

CONSTANTINE'S
PATENT TREASURE
COOKING RANGE,

With the Patent Rising Fire Grating for reducing or enlarging the Fire.

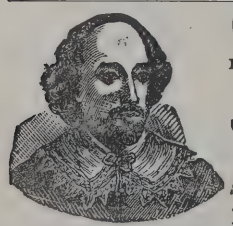
THE FIRST PRIZE

Was awarded to the Patentee, after nearly one thousand tests of a variety of Ranges, by the Smoke Abatement Exhibition, Ladies' Committee, South Kensington, as well as the Grand Prize by the Exhibition, First Silver Medal. Vide *Times*, July 18 and 19, 1882. Also received Highest Awards at the Medical and Sanitary, the Fisheries, the Health, and the Inventions Exhibitions.

DISTINCTIVE MERITS.

Perfection in Cookery.
Economy in Fuel.
Smoky Chimneys effectually Cured.
Unsurpassed for Durability.
May be placed anywhere.

Illustrated Price Books, with Testimonials, Post Free.



A. R. CONSTANTINE, 61 Fleet Street, E.C.

N.B.—Judges have conferred Greatest Honours, Highest Awards, Gold and Silver Medals at all Competitive Exhibitions.

56. State also their several duties.
57. For what purpose is the magnetic needle used in surveying land?
58. What is a traverse table and for what used?
59. How do you set out a circular curved line upon the ground?
60. If an obstacle occurs to alignment, state how you would overcome it upon straight lines; also upon curves.
61. The radius of a curve being given and angle of intersection of the two tangents, how do you find the length of the tangent from their intersection to the beginning of the curve?
62. Describe an engineer's transit, and name its adjustments?
63. Describe a Y level, and name its adjustments.
64. How many kinds of levelling rods do you know of?
65. State how they are graduated, and how they can be read to the $\frac{1}{1000}$ of a foot.
66. Show a form of field-book for transit notes used when "running" curves, and place thereon notes of a 5 deg. curve for 1,000, with two intermediate "set-ups."
67. Show a form of level-book, and place therein sufficient figures to show your method.
68. What are cross-sections?
69. How do you set slope stakes for excavation and embankment?
70. What is a grade line?
71. What proportion of the breaking weight of a beam would you consider a safe load?
72. With the load uniformly distributed, what fractional part of the whole weight may be considered, in all calculations, as being carried at the centre?
73. Suppose a beam supported at both ends, and take w = weight, l = length of beam, b = breadth, d = depth, s = breaking weight. Express algebraically the value of s in terms of the other quantities.
74. Sectional area being 36 square inches, which would be the stronger section, 6 by 6 or 4 by 9?
75. Make a design for a pair of rafters, connected by a tie-beam, for a roof 30 feet span, showing the dimensions of the several parts and the manner of connecting them. State in detail your method of obtaining the several dimensions.
76. How do you apply the principle of the parallelogram of forces in determining the strain on the various members of a structure? Illustrate graphically.
77. What should be the thickness at the top and base of a retaining wall 15 feet high, built to retain ordinary earth? Show your method of obtaining the required dimensions; also a sketch of the wall, showing how it should be founded.
78. A reservoir is to be built, depth of water 10 feet. If the walls are built of masonry, find the thickness of the same, and state how they should be built. Show your work.
79. What is an arch, of how many forms, and of what may it be constructed?
80. Can you state how you would find the thickness of an arch of stone, span and rise being given?
81. Define the intrados and extrados of an arch.
82. Where should the line of resistance to pressure be found in an arch in order to retain its stability?
83. Can you find the thickness of the abutments, the rise and span of the arch being given?
84. In a semicircular arch, where is the horizontal thrust greatest and where least?
85. Name the common kinds of stone used in building.
86. Define the terms "quarry-faced," "rough-pointed," "fine-axed," "bush-hammered," as applied to the dressing of stone.
87. Describe "rubble" masonry, "ashlar" masonry, and "broken ashlar" masonry.
88. What are "headers" and "stretchers"?
89. What should be the proportion of "headers" to "stretchers"?
90. How would you prepare the foundation for a heavy wall, and how deep should it be excavated?
91. How are walls founded on soft or yielding materials?
92. Describe a good quality of bricks, and state how you would know a good brick from a poor one.
93. In how many ways is brickwork "bonded" to make good work in heavy walls?
94. What is hydraulic cement, and how many kinds do you know of?
95. Which do you consider the better quality, Rosendale or Portland, and why?
96. What is mortar composed of, and how mixed?
97. What kind of sand should be used, and how do you test its quality?
98. What is the meaning of the term "setting," as applied to cement?
99. How would you test cement?
100. What is concrete; of what composed, and in what proportion should its ingredients be mixed?

101. Name the common kinds of wood used in building?
102. What kind of timber resists decay longest under ground?
103. How may timber be preserved from decay?
104. What do you understand by limit of elasticity as applied to a beam under strain or pressure; what is meant by the neutral axis of a beam?
105. What is the tensile strength of a good quality of wrought iron per square inch?
106. For what parts of a structure may cast and wrought iron be used in reference to tension and compression?
107. Make a sketch of the form of cast-iron beam best adapted to resist a transverse strain.

MARBLE QUARRIES AT CARRARA.

A CORRESPONDENT of the *Scotsman* gives the following account of a visit to the marble quarries at Carrara:—Arrived at Ravaccione, we found ourselves in the midst of a wild and busy scene. Marble *débris* from the quarries above covered the hill sides, and filled up to a great depth the dip of the valley. Huge glittering blocks of marble lay scattered around, or were being rolled by men, as best they could, on to carts. The oxen standing all about were fortifying themselves with weedy hay against a fresh long pull, and enjoying what repose the flies permitted them to take. The blowing of a horn, followed by a loud report that went echoing amongst the rocks, and the rumbling noise of tons of falling marble, made us start. We turned to see what was happening, when another sharp blast of horn and of powder caused us to wheel round again. A glance was sufficient to show us that the sides of the mountains up to the very top of Crestola, which blocks this valley, and whose white peak look like a lighthouse from the sea, were alive with men, blasting, hammering, sawing, chiselling, or, most dangerous work of all, lowering blocks of marble from great heights and distances to where we stood. This last is accomplished by means of what are called "lizze," and is an exceedingly difficult, as well as perilous, operation. An arduous climb took us to where a "lizza" was being laden, so that we were enabled to examine it closely. It consists of the trunks of two young trees sharpened and curved upwards at one end, and bound together by cross bars, forming thus a kind of sledge, 16 or 18 feet long, and from 4 to 5 feet broad. This is placed on soaped sleepers at the edge of the quarry, ready like a ship on its stocks to be launched. Half a dozen blocks of marble, weighing fifty or sixty tons, are then securely bound upon it with chains. A number of men are now told off for its escort. One goes in front, one behind, one at either side, and two on the top. Other men have charge of long, stout ropes, which are attached one to each side of the lizza. At intervals on alternate sides of the steep, twisting, uneven path down which it has to go, are firmly planted into the rock short stout marble pillars, like mooring posts along a quay. The ropes are hitched round the first of these, and away the lizza glides. Now the escort men find their work in watching its exciting progress, and in making the few sleepers on which it stands do duty all down the hill; for as soon as it has passed over one sleeper it is picked up by the man behind, who hands it to the men on the top, by whom it is re-soaped and passed on to the one in front, and he, again, lays it before the ponderous lizza. In this way the road is fabricated to the progress of the mountain car, much as a path is made for a boat that is being pulled up a shingly beach. For its progress the rope-holders are responsible. They pay out their cables slowly and steadily, and in lengths proportioned to the intervals between the mooring-posts. As each of these is reached the lizza is stopped, so as to allow the men alternately to descend and make it a fresh lowering point. The whole descent is perilous in the extreme. The friction and strain are so great that deep hollows are worn in these marble posts. The ropes fray out, and have to be repaired on the way, although, being made of many scores of cords only loosely twisted together, they seldom cut or snap The marble projecting across the lizza swings at times dangerously from side to side. Turning the curves at a gradient of 1 in 20, we held our breath, as the whole affair seemed about to capsize and spread death and ruin down the valley. With the greatest care accidents do happen, and not a week passes without some disaster. We were told that there were not less than two workmen killed and five or six hurt per month.

We were anxious to pass over the mountain that here separates this valley from the "Canale Grande," so that we might return by it to Carrara. We made the attempt, but our progress was slow, as we had frequently to get out of the way of the gliding "lizze" or seek safety behind blocks of marble during blasting operations. The quarrymen, whom we met at different heights, advised us to turn back, as the further we went the more dangerous we should find it, because it was near

ARTISTIC SANITARY WALL-HANGINGS.

DURO-TEXTILE, Combines all the artistic and hygienic effects of a Painted Wall, at a great saving in cost. Can be SCRUBBED with Soap and Water any number of times without injury.

MURALINE, a highly-finished artistic washable Wall Paper, in beautiful designs and colourings.

EMBOSSED TAPESTRY, a high-class Wall-Hanging, fitted for superior Decorations, made in the most striking effects.

Patterns are kept by all Decorators and Upholsterers, or will be sent on application to

COLES, STEWART & CO.,
STOCK AND SHARE BROKERS.

Messrs. COLES, STEWART & CO. undertake every description of Stock Exchange business, and have special and early information on all leading Stocks; they are also continually advised by telegram from the chief Mining centres, both at home and abroad. For Investment Messrs. C., S. & Co. make only one charge of $\frac{1}{16}$ per cent. commission on all descriptions of Stocks, and open Speculative accounts with from 1 per cent. cover and upwards, without any further risk or liability to their clients whatever.

THUS, £5 commands £500 Stock; £10, £1,000 Stock; £50, £5,000 Stock;
And so on to any amount.

In the transaction of speculative business Messrs. C., S. & Co. make no charge for commission or brokerage whatever unless their client makes a profit, when they take 5 per cent. of the profit made as their remuneration.

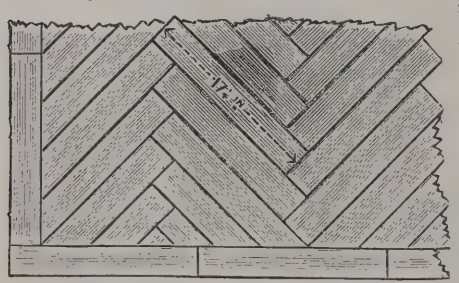
All transactions advised by wire as soon as completed. Monthly Circulars and Mining Reports post-free on application.

COLES, STEWART & CO., St. Stephen's Chambers. LONDON, E.C.

time to knock off work, when all blastings ready would be fired, and there would be immense quantities of falling marble. At last we took their advice, reserving thus the Canale Grande, with its old Roman roads and quarries, for another day's excursion.

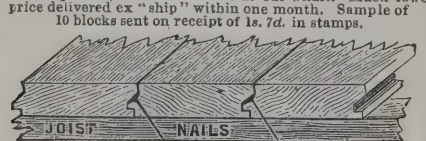
On our return journey to Carrara we had the good company of many of the quarrymen, who gave us details about their work and earnings. The poorest paid are the oxen drivers, who receive 2 frs. (*1s. 7d.*) per day. The men who lay mines get 3 frs. (*2s. 4½d.*). Those who cut marble and work the lizza are paid by the piece, and the former earn generally from 3 to 4 frs., and the latter, whose work is best paid because most dangerous, earn 8 or 9 frs. per day. They start work generally as soon as it is light, and continue during eight of the coolest hours of the day. But as Ravaccione is about five miles from Carrara, and its quarries from one to two thousand feet high, many workmen have two and a half hours' walk and climb before they can start their day's labour.

However, we found all polite, contented, happy, and ready to talk and to give information. They seemed to be proud of their "White Valley," which, though not yielding the largest blocks, yet gives the finest statuary marble in the world; and prouder still they were of their mountains, whose supplies of this precious stone show no sign of diminution, although 6,000 men cut yearly 200,000 tons from their giant breasts, but are as able now as they were long centuries ago to meet the requirements of mankind in the four quarters of the globe.



FIRES IN THEATRES.

AT an exhibition of lighting appliances now being held at the Brussels Bourse, M. Léon Lenaerts, of Brussels, shows in action an apparatus for use in cases of fire in theatres. By means of the arrangement, in which electricity aids and supplements gas, anyone is able, on an alarm of fire being raised, to shut off the supply of gas at the meter, thus preventing an explosion, and at the same time lighting up some incandescent electric lamps which direct the way to the exit doors. Thus an audience seized with panic would be reassured on seeing the safety lamps illuminated, which would inform them that the gas was shut off, and, instead of being left in total darkness, would be shown the nearest way out. Moreover, if a fire should break out without attracting notice, electrical contact would be made by the insulating substance being consumed from double wires disposed about the building, thus producing the same results automatically.



LIVERPOOL EXHIBITION.

IN our previous notices of the Liverpool Exhibition we omitted to mention a very interesting exhibit by Mr. John Wilson, of Erskine Street, Manchester. An entirely new form of portable parallel bars is shown, fitted with patent castors for easily moving about. The uprights rise from the base in pairs, and the whole apparatus can be taken in pieces and put together again in a very few minutes, and can be removed easily from one room to another. The sliding uprights are of a new pattern, being of iron tubes, and the bars are provided with steel cores and are adjustable to any height. One end also of the bars can be raised, making the bars oblique. The next notable exhibit is a new pattern jumping-stand. The pins are fixed in a loose slip of wood a foot long, and it can be raised foot by foot. By this arrangement loose pegs are dispensed with, and also pins the whole length of the stands. There are also various patterns of polished beech clubs, and some of pitch pine for ladies and children's use. Another exhibit is a plain climbing and also a ladder plank with a first-class portable horizontal bar, having steel core and iron uprights and stays. The bar is adjustable in height. A speciality in horizontal bars is one to sell at *2l.*, with a steel core and wooden uprights, with stays complete. A lighter bar is made in a similar way for *30s.* Ropes and rings, with a swivel joint and leather-covered, are shown, provided with sliders, so that the rings can be adjusted in height. A trapeze bar, with similar ropes and sliders, is also shown. The trapeze bar has a steel core and brass ends. A useful gymnasium for private use is an apparatus which can be fixed to any ceiling with a floor above it. It is made in three qualities, the better one with silk webbing and plated mountings. It consists of a pair of large wooden rings, trapeze bar, sitting and standing swings, with pair of stirrups; and a baby's swing can also be attached. A very large number of exercises can be performed on it. The prices range from *1l. 1s.* for a pair of rings with adjustable sliders, to *4l.* with silk webbing and extras as described, with the exception of baby swing, which is *15s.* extra. A good collection of dumb-bells (from very good patterns), at the very low price of *1½d.* per lb., is also

LONDON BOARD SCHOOL FLOORING BLOCKS.
The only Prize Medal at Health Exhibition.

Out of 17½ in. by 3 in. by 3 in. best Yellow Deal, planed all round. At 11*s.* 6*d.* per 100, delivered to van at our wharf. Much lower price delivered ex "ship" within one month. Sample of 10 blocks sent on receipt of 1*s.* 7*d.* in stamps.

Dry Figured Wainscot Flooring, with above special joint to conceal nails, at following very low prices:—1¼ × 4½ Dry Wainscot Oak, 54*s.* 9*d.* per square; 1 × 4½ ditto, 45*s.*; 1¼ × 4 Pitch Pine, 26*s.* 6*d.*; × 4 ditto, 22*s.* 9*d.* IMPORTERS—

Established upwards of a Century.

BY HER MAJESTY'S ROYAL LETTERS PATENT.
ESTABLISHED A.D. 1774.
AUSTIN'S
NEW IMPERIAL PATENT
SUPERFINE FLAX LINE.
The above article is now being manufactured and sold in large quantities for Greenhouse Sashes, Public-house Shutters, and other heavy work. The Manufacturers would recommend it for its strength, and the large amount of wear in it, consequent on its peculiar manufacture.
AUSTIN'S IMPERIAL PATENT FLAX SASH AND BLIND LINES (two Prize Medals awarded). The manufacturers of the above articles particularly wish to draw the attention of the trade to their Imperial Patent Flax Sash Lines, of which they are now making six qualities, all of which they can strongly recommend, as they have given unqualified satisfaction to the trade for now over One Hundred Years; and the Proprietors continue to give their personal attention to the manufacture of these goods.
They also invite the particular attention of the trade to their IMPERIAL PATENT BLIND LINES, which are very superior to anything yet offered.
They can be obtained of all Ropemakers, Ironmongers, Merchants, Factors, and Wholesale Houses in town and country.
N.B.—Please note that all our goods as advertised above are labelled, either inside or outside, with our Trade Mark—The "Anchor."

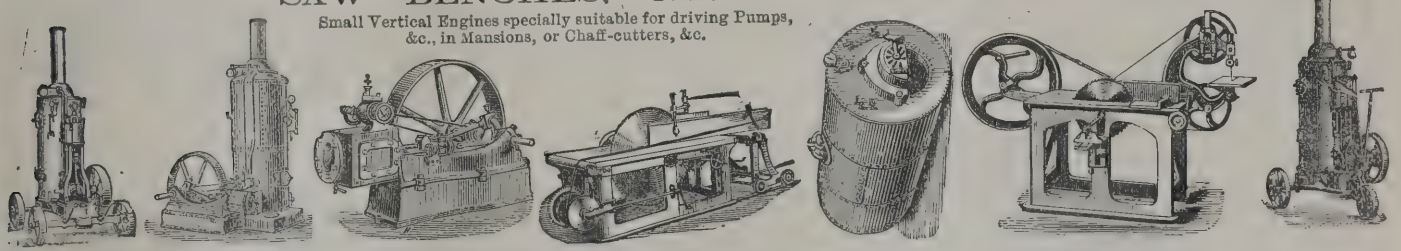
shown, together with boxing-gloves, wands, wood rings, foils, and other apparatus used in gymnasia and gymnastic exercises. A wand is shown with bells at the ends, which is very pleasing when in use. Mr. Wilson is the gymnastic fitting contractor to the army, and is at present fitting up the riding schools at Regent's Park, Knightsbridge, Hounslow, Leeds, Norwich, Birmingham, and Hulme; also Clonmel, Dundalk, and Newbridge, Ireland.

THE PLUMBERS' COMPANY.



The Court of the Worshipful Company of Plumbers have taken a step which promises not only to benefit the particular craft in which they are interested, but still more largely the public. Of late years, from various causes, the plumbers' trade has risen in importance. The modern system of water supply and drainage, based on the principles of sanitary science, requires both high skill and trustworthy workmanship on the part of the artisans who have to carry it out. Plumbers ought to take rank among the highest class of skilled artisans, and earn wages calculated in proportion to the importance of their work. Yet, as every householder knows, instances of defective workmanship in pipes and cisterns are amongst the most frequent causes of expense and trouble; and, as the doctors tell us, a no less frequent cause of dangerous disease. The Worshipful Company of Plumbers some two years ago determined to exert their influence as a corporation, and to organise in a thoroughly practical fashion the important branch of industry of which they are the natural guardians. Their first move was to hold a conference of metropolitan and provincial plumbers in October 1884; and one of the results of this was the establishment of a general council to give practical effect to the resolutions passed by the representatives of the trade. A glance at the list of the members of this general council will show that it has been established on the most open and liberal basis. Side by side with members of the court of the company, the general council includes men like the chairman of the Metropolitan Board of Works, the chairman of the Sanitary Institute, the Lord Mayors of London and York, Lord Fortescue, Sir Robert Fowler, and a large number of other gentlemen who, though not directly connected with the trade in question, have taken interest in matters of sanitation. Moreover, it contains twelve members nominated in the interest of the workmen by the plumbing trade of London. The object of the movement is to enrol all efficient plumbers in a kind of society, to which they will not be admitted without proof of character and skill in their craft. As a first step towards this a register for plumbers of the City of London has been opened, on which all properly qualified plumbers are invited to enrol themselves. All applications are considered by a special committee of registration, largely composed of practical plumbers, and selected with a view to secure absolute impartiality. This committee by admitting a man to the register bestow on him a credential of skill in his craft, and thereby give the public a reasonable certainty of securing good workmanship. More than two hundred plumbers have already been registered, and a still larger number of candidates are awaiting enrolment. Useful as this scheme of registration will obviously be, it does not represent the whole design of the company. They desire not only to exercise a general and salutary supervision over the trade in all its branches, but intend also to carry out one of the most important functions of their position by providing means of technical education for the younger members of the craft; and a further item in their programme is to press on architects and other authorities the necessity for more closely watching and examining plumbers' work, especially in new houses. Now, to secure these objects, it has been suggested that legislation is necessary in order that the Plumbers' Company may be constituted an examining and certifying body, in a position similar, for instance, to that occupied by the authorities of Apothecaries' Hall. But if such legislation can be avoided—and we believe it can—the good work taken in hand by the company will, in our opinion, make more satisfactory and probably more rapid progress. When it is once understood that certain plumbers hold a certificate of efficiency from the registration committee of the company, there is no doubt whatever that such men will gain an advantage in the competition for employment. This will quickly increase the list of candidates for registration, and will tend to draw a line between the properly qualified and the unqualified plumber, which will make it practically imperative on architects and builders, for their own sake, to secure the services of men who are registered. But whether the desired end be attained by the aid of legislation or without it, the action of the Plumbers' Company deserves all support, both from the public and from the members of the trade. It is a praiseworthy effort to fulfil the duties which the founders of the great London companies intended that they should fulfil. Under the care of the company the working plumbers would find their interests much

more judiciously safeguarded than under the control—too often both foolish and despotic—of any of the trade associations which artisans have established for themselves, never to the advantage of the best class of workmen, and often to the serious disadvantage of the general body.—*Morning Post.*

COMMERCIAL MUSEUMS IN FRANCE.

THE following scheme for the organisation of commercial museums is put forward by the French Government as a guide to chambers of commerce desirous of creating a commercial museum, or giving support to an institution of the kind. The chambers may alter or enlarge it at their pleasure, according to the means at their disposal or the requirements of the locality.

I. *Object of the Commercial Museums.*

The commercial museum is intended to be an exhibition of foreign materials and foreign manufactured products interesting to the region; should the chamber think fit, it can also be an exhibition of home products of the region. This exhibition will be most interesting as regards technical education and import and export business. The purpose for which it is promoted is to communicate knowledge and information:—(*a*) To mercantile men as to raw materials which may be imported with advantage from abroad. (*b*) To manufacturers and working-men as to foreign modes of manufacture. (*c*) To exporters as to foreign goods in demand on the markets of the world. These museums will facilitate for French manufacturers the imitation of or improvement on products manufactured abroad, and they will enable our nationals to compete with foreigners by making them acquainted with the tastes and wants of the customer.

II. *Site of the Museum.*

An establishment of this kind must be formed in a locality close to business centres, *ex. gr.*, near commercial exchanges, or in the buildings occupied by chambers of commerce. It may with advantage be placed in the neighbourhood of professional schools of commerce and industry.

III. *Administration of the Museum.*

The museums are managed by the chambers of commerce in accordance with their expressed wish. But as several municipalities and industrial societies in towns have taken measures to found similar institutions, the character of a commercial museum will be conceded to any establishment of the kind to which a chamber of commerce shall have given support.

IV. *Supply of the Museum.*

Museums will be supplied as follows:—1. Samples gratuitously furnished to the Ministry of Commerce will be gratuitously distributed from thence to all commercial museums, according to the interests of the regions to which the museums belong.

2. The samples for which the museums may apply to the Minister of Commerce will be got for them at their expense through the consular agents of France abroad. The Ministry of Commerce will communicate to the authorities of the museums such information as it may have received respecting the nature and selection of interesting samples.

3. Museums will also be free to exhibit samples obtained from other sources than those above enumerated, such as foreign commission agents, merchants, or makers.

V. *Internal Arrangements and Classifications.*

The products exhibited in commercial museums shall be divided into four great classes as follows:—

1. Imported articles, comprising raw materials from abroad, likely to be purchased with advantage by French commercial classes; the same if suited in certain cases to lead, when used, to a reduction in the cost price of manufactured articles, or the same again if well fitted to cause the establishment of a new manufacture.

2. Export articles, including those manufactured abroad, which are imported into markets where similar French goods may compete.

3. Packings and preparations connected with the mode in which merchandise should be made up for particular places at particular points of the globe's surface.

4. Local products, comprising those of the soil and those of the manufactures of the region. Samples of these must, as much as possible, be displayed in classes and geographical divisions, the latter depending on the place of origin as regards imports, and on markets as regards exports, packings, and make up. The aim to be attained in such classifications should be the laying out of a synoptical exhibition, which shall enable visitors easily to find the articles which interest them.

A place may be reserved for the display of advertisements, relative to adjudications of great public works abroad.

RUPTURES! RUPTURES!!

HARNESS' GOLD MEDAL ELECTROPATHIC XYLONITE TRUSS.

ADVICE FREE.

Price 21s. POST FREE.

Guaranteed to Last a Lifetime!

SELF-ADJUSTING, Light, Comfortable, Washable, Non-irritating. Can be worn by any person, under all circumstances, in any climate. Manufactured of the best Sheffield Steel, covered with XYLONITE (Flesh-coloured Artificial Ivory). It is absolutely free from Rubber, Leather, and other objectionable material, and is admitted by the most distinguished Surgeons to possess all the advantages and none of the disadvantages of every other Truss in the Market. PATIENTS SUFFERING from any form of Hernia are thus supplied with the *most perfect remedial appliances* at moderate prices. THE SKILLED ADVICE (free of charge) of a gentleman who has had *extensive experience* in the treatment of Hernia is at the disposal of those who can call at 52 Oxford Street, London, W.

ORDERS BY POST should state the nature of the displacement. Measurement required—circumference of the body one inch below the hips.

HARNESS' XYLONITE TRUSS.

Combines COMFORT, SUPPORT, ELEGANCE, AND CLEANLINESS.

RUPTURES! RUPTURES!

A NEW TRUSS—AN IMPORTANT INVENTION.—MR. C. B. HARNESS, the well-known Inventor of Electropathic Belts and other Curative Electrical Appliances, has lately introduced a new ELECTROPATHIC XYLONITE TRUSS, which has already been highly approved of and adopted by the highest Scientific and Medical authorities. It has a beautifully smooth, flesh-coloured surface of a washable and durable material. It is cheap, will last a lifetime, and the healing influences of its mild electric action renders it a boon to the afflicted patient. No sufferer should be without one of these *perfect trusses*. SKILLED ADVICE FREE OF CHARGE. Note address and call without delay on The MEDICAL BATTERY COMPANY (Limited), 52 OXFORD STREET, LONDON, W.

Note the Address:

THE MEDICAL BATTERY COMPANY, LD.

52 OXFORD STREET, LONDON, W.

VI. *Labels, Index, and Publicity.*

Every sample in a museum shall be labelled, the label to be filled up with a description of the nature and origin of the goods which it covers. Each label is to be furnished with a special number, establishing the date of entry of the article in the class to which it belongs, and a general number of reference to an index or alphabetical *repertorium* on checks (*répertoire à fiches mobiles*), which shall be open to the visiting public.

The checks (*fiches*) of this catalogue, when filled up, shall comprise the following information :—Nature and origin of the article catalogued, the market in which it is sold, the method of its manufacture, materials out of which it is made, dimensions, sale price, cost price, and conditions of transport. Eventually the cards shall also include the number of another series of cards, relating to class of packing and make up, so that the visitor shall be informed as to the dressing or fashion (*façon*) required for certain articles of export. Moreover, it will be interesting in certain cases to give a reference to the letters of the Ministry of Commerce, the Consuls, or the correspondents who sent the samples to the museums, a reference also to any number of the *Moniteur Officiel du Commerce*, or other commercial paper containing information in respect of the articles exhibited in the museum.

The index on checks is to be kept regularly up to date. Advertisements published by the *Moniteur Officiel du Commerce*, by the newspapers of the locality, or by posters in exchanges or other public places, or on the doors of the museum, shall keep the public informed as to any newly-exhibited samples, and state to what class they belong.

VII. *Entrance into Museums, Communications to the Public, and Distribution of Samples.*

1. Museums are to be open without charge.

2. Information will be supplied as far as possible by the officer in charge of the preservation and classification of the things exhibited. Neither the managers of museums nor other administrators or persons who shall have procured samples are responsible for the information furnished through commercial museums.

3. When samples are large enough to allow of it, pieces of them may be cut of and disposed of at a charge which shall be determined by the managers of the museums. The samples so distributed to the public shall, if possible, be accompanied by a note describing the place from whence the article came, its sale market, mode of manufacture, the materials of which it is composed, its dimensions, cost price, and conditions of carriage. Samples of articles out of fashion are to be preserved in order to form a retrospective museum. For this purpose the managers must always keep a specimen of the sample which they distribute to the public.

VIII. *Library—Special Archives.*

1. Side by side with collections of samples, there shall be in each museum a library of books and publications. It would be of advantage that the commercial museums should bring together in the localities at their disposal such technical works as refer to commerce and industry. The *Moniteur Officiel du Commerce* will be furnished by the Minister for the use of the museum. The managers of museums will find in this publication reports from French and from foreign consuls, giving details not otherwise easily accessible as to foreign manufactures, by a reference to which they may give orders for samples. Mercantile men, too, will find in these libraries—

1. The rates of customs duties payable in the foreign countries with which the merchants of the region of the museum are in the habit of trading.

2. Rates of dues levied in the chief foreign ports to which the same traders have goods to send.

3. Tariffs of carriage rates on French and foreign railways ; in fact, every species of document of a kind interesting to commerce and industry.

The office for commercial information at the Ministry of Commerce will be the natural correspondent of the museums, and will furnish them with such of the documents as they have not got.

It might be advantageous if chambers of commerce, professional schools, and industrial societies, already in possession of the nucleus of industrial and commercial libraries, should combine their resources of this kind with those which commercial museums are in future to bring together.

The officials of museums are bound to class with the greatest care all letters enclosing or accompanying parcels of samples. The correspondence so entered will form the chief bulk of the special archives of the museums. It will contain information as to the business in, or the manufacture of, the products exhibited in the museums, which it would be difficult to confine entirely or completely in the cards of the *repertorium* or the leaves of a catalogue.

"THE PEDESTAL VASE,"

JENNINGS' IMPROVED W.C. APPARATUS

(Combination Urinal and Slop Sink).

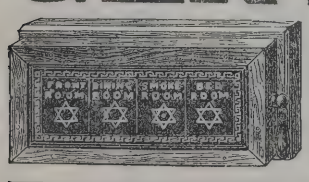
Registered No. 16,300.

A PORCELAIN VASE set on a tiled or mosaic floor, within walls or a dado of glazed tiles. The usual wood framing, forming a storehouse for the retention and accumulation of *damp*, *dirt*, and *disease germs*, with the joints, crevices, and imperfections in work which the closet enclosure so often conceals, is entirely abolished. The seat is hinged, permitting free access for use as a *slop sink* or *urinal*, and for cleansing, so that the entire apparatus and space can be freely washed down. For this latter purpose the floor should be slightly sunk, and laid to fall to a grating, with waste carried through the external wall, and terminating in a copper flap valve to prevent draught.

☞ The suggestions as regards wall linings and floor, may, of course, be modified as best adapted to the building in which the closets are used; and in the consideration of such details, alternative schemes will readily present themselves.

At the recent **HEALTH EXHIBITION** (South Kensington, 1884), amongst a series of official tests, under the supervision of Baldwin Latham, Esq., C.E., and the Jury No. 9, Class XXIII., and successfully withstood by this closet, the following may be cited in evidence of its efficient action. Being fixed in position shown in illustration, with **"JENNINGS' PATENT SINGLE FLUSH WASTE-PREVENTING SYPHON CISTERN"** 5 feet over, with 1½ inch down pipe, ten apples (averaging 1¼ inch diameter) and a flat sponge about 4½ inch diameter were thrown into the basin. The water, as well as the whole of the exposed or dry surface, was first blackened with plumber's "smudge," and the sides covered by four pieces of thin sanitary paper, which adhered closely to the soiled surface. The handle of the cistern was then pulled, and the two-gallon flush liberated. After seven seconds (the time occupied by the discharge), a receiver placed under the trap outlet was removed, containing in the blackened water **the ten apples, the sponge, and the four pieces of paper,** no traces of the soil remaining visible upon any part of the apparatus.

GOLD MEDAL AWARDED.



THESE CLOSETS are already in use in Hospitals, Banks, Hotels, Offices, Private Residences, &c., with most satisfactory results, and, fixed in the manner described, in appearance and action leave nothing to be desired. By the novel arrangement of the supply to Basin, as shown in the sectional sketch annexed, the whole surface is well flushed and cleansed, whilst the bottom of Basin and Trap are thoroughly scoured by a concentrated rush of water which insures the **instantaneous removal** of the contents, thus overcoming the inherent defects in the many imitations recently produced of **"JENNINGS' MONKEY-CLOSET"** (the **original form of wash-out watercloset**), which was invented and patented by G. J. in 1852.

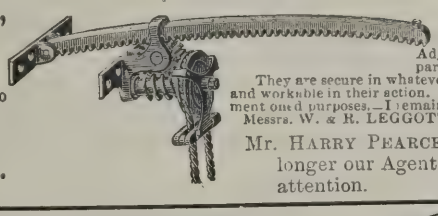
INTERNATIONAL HEALTH EXHIBITION.—MEDAL Awarded for

LEGGOTT'S PATENT ADJUSTMENT,

FOR FANLIGHTS, SKYLIGHTS, &c.,

Is admitted to be the best ever put before the Public.



From 5s. each.

Write for REDUCED PRICE LIST and Testimonials to

W. & R. LEGGOTT,

70 Park Road, Bradford, Yorkshire.

N.B.—Size and height of window no object.

TESTIMONIAL.

BANGOR, N. Wales: September 14, 1885.

Sirs,—I have pleasure in testifying that I have used Leggott's Silen Adjustments for various buildings to high skylights, fanlights, and top parts of windows, and in every case they gave satisfaction.

They are secure in whatever position, whether the window is open or closed, and are quite simple and workable in their action. I prefer them to any other that I have seen or used for the above-ment oned purposes.—I remain, yours obediently, R. DAVIES, Architect.

Messrs. W. & R. LEGGOTT, Bradford.

Mr. HARRY PEARCE, 125 Great Portland Street, London, W., is no longer our Agent. All direct communications shall have our prompt attention. W. & R. L.

TRADE NOTES.

THE Government have ordered four of Atkinson's patent "Differential" gas-engines, with patent air-compressors combined, to work in connection with Shone's system of pneumatic drainage, which is being applied to the Houses of Parliament for dealing with the sewage. The engines are to be fixed in the basement under the Chambers. This, we believe, is the only form of gas-engine which has been successfully used in connection with the "Shone" system of drainage.

MESSRS. HENDRA & GOODING, of North Road, Holloway, the patentees of the "Interchangeable Rubber Tread," have written asking us to correct an error which occurred in our last issue on page 8. Kindly read "Hendra & Gooding," not "Hendrad Gooding."

WE are informed Messrs. Woodhouse & Rawson, of 11 Queen Victoria Street, E.C., have made arrangements with the Edison & Swan United Electric Light Company to pay a royalty upon lamps sold by them pending the appeal, the royalty to be returned in case the appeal is successful. The result of this will be that, should Messrs. Rawson be unsuccessful in the appeal, the Edison & Swan Company will have no claim on the purchasers of these lamps.

THE new number of *L'Art* contains an etching by M. Mordant after the painting by Gerard Ter Borch, for which permission to publish was given by the owner, the Princess Demidoff. There is also a reproduction of a drawing by Millet. Among the articles is one of a series on the works of Rubens in Austria by Herr Berggruen, the director of the Society of Engravers in Vienna, and an elaborate article on Verrochio by M. Eugene Muntz, both being amply illustrated. M. Paul Leroi has the first part of a criticism on a work by Signor Venturi, describing the Gallery at Modena.

MESSRS. H. & C. DAVIS & CO., of the Metropolitan Gas Stove Works, Camberwell Road, S.E., have obtained the contract for a range of three large gas roasters, with enamelled interiors, to cook for 800 people, for the Guardians of St.

FLAT BRICK FIRE-PROOF FLOORS.

LONDON, 1874.

LONGITUDINAL SECTION.

BRUSSELS, 1876.

THE BEST as well as the CHEAPEST Fire-proof Floors yet introduced. Their small cost makes them specially suitable for artisans dwellings, residential flats, offices, chambers, and private houses.

They are constructed with hard-burnt bricks, laid flat, and bonded on the upper face with tough concrete 3 inches thick; and by the method of laying all iron is protected from the action of fire.

Experiments show a resistance to load and impact greater than furnished by the ordinary concrete floors. No thrust is transmitted to the walls, as in all arched construction, the walls being tied in and strengthened.

The floors are practically noiseless, the different densities of the concrete, brick and plaster, with the air space above, intercepting the sound vibrations.

The brick soffit forms a capital key for the plaster, and no laths or counterceiling are necessary, but for high-class work wood blocks are introduced in the soffit, to which the ordinary lath and plastering or fibrous plaster is fixed. This also provides a second air space, and furnishes the most perfect sound-resisting floors known.

They are not affected by water, acids, or alkalies, and they may be fixed during the progress of the building, thus dispensing with the use of internal scaffolding.

The concrete being tough instead of friable, the boarded finish may be nailed down without the use of sleeper joists. It is recommended to use an inch strip as a sleeper fillet. This will provide ventilation, and space for gas and water-pipes.

The depth of the finished floor is 6 to 9 inches only, and when the saving on this head is taken into account, the cost does not exceed that of the ordinary combustible timber floor of corresponding strength.

HOMAN & RODGERS,

Engineers and Patentees,

17 GRACECHURCH ST., LONDON, E.C., & 13 DAWSON ST., MANCHESTER.

WORKS: RATCLIFF, LONDON, E., & HULME IRONWORKS, MANCHESTER.

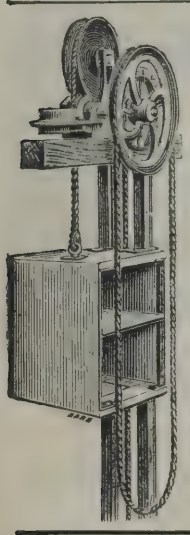
London Telephone, No. 1,026. Registered Telegraphic Address—"HOMAN RODGERS, London"; "NAMOH, Manchester."



Olave's, Bermondsey. They are also constructing a large gas roaster and hot-plate for the Guardians of St. George's, Hanover Square, for the union in Fulham Road. In addition to the above they have an order in hand for a large gas roaster, hot-plate, gas steam boiler, &c., for King's College Hospital, similar to the arrangement supplied by them about two years since for King's College, Strand.

THE REAFFORESTING OF IRELAND.

THE proposal to plant forests on a grand scale in Ireland originated with Dr. Lyons, a physician in Dublin. In a recent communication, he gives the following information on the subject :—

The industrial and other operations referred to by the Chancellor of the Exchequer, raise again the question of reafforesting Ireland. Since I had the honour to address you last on the subject the recognition of forestry as an agent in industries has assumed very large proportions in Europe and America, including Canada. In Ireland, to which I wish to confine my observations chiefly on this occasion, a considerable advance has been made in our knowledge of the subject, and its adaptability to the wants and conditions of this country. Last autumn I had the good fortune to induce Dr. William Schliel, the head of the Indian Forest Department, now in Europe with a view to a final arrangement of the question of the Foresting School at Cooper's Hill College, to visit Ireland. He followed in a general way the route already traversed at my suggestion by Mr. D. Howitz, of Copenhagen, whose able report was published on my motion as a Parliamentary Paper, No. 30 Session of 1884. Dr. Schliel was introduced to the then Lord Lieutenant, the Earl of Carnarvon, who invited him to put his views in form of a report, which was subsequently printed by Thom & Co., 1886, but not published in the ordinary sense. As I believe that Dr. Schliel's able paper contains matter of the highest moment to the best interests of Ireland, and as I am the person mainly responsible for his visit to this country, I take it on myself to give to the Irish public the following important extracts. Ireland is thus indebted to two volunteers, Mr. Howitz and Dr. Schliel, for most able and valuable services in the initiation of her future forests.

After some preliminary observations, Dr. Schliel, from the most recent and reliable data furnished by myself and others, Foreign Office reports, Canadian ditto, per Colonial officers, states 18 millions sterling per annum to be the value of the wood imported into Great Britain and Ireland, while the minor forest products, as barks, dye-woods, wood-pulp, galls, turpentine, pitch and tar, resin, lac, gum, caoutchouc, gutta-percha, fibres, &c., equal 14 millions sterling per annum—total, 32 millions sterling a year, or about one pound per head of the population. Stated otherwise, the annual imports of timber amount to 6,447,211 loads, of which Sweden sent 1,600,000 loads; Russia, 1,350,000; Norway, 750,000; Germany, 430,000; United States of America, 400,000; and Canada, 1,540,000 loads. So far as the available information goes, says Dr. Schliel, it seems almost certain that the supply from the United States will die away rapidly at an early date. Of the foregoing European countries a sustained yield is only secured from Germany, where the bulk of the forests is under systematic management and control; indeed, it is believed the imports can easily be increased, especially from the forests of East Prussia. In Sweden, Norway, and Russia the forest conservancy measures so far introduced do not, if I am correctly informed, insure a sustained yield of the quantities removed of late years, though the falling off in the supplies may not be so rapid as has been assumed. These sources, then, cannot be relied on to furnish for any length of time 3,700,000 loads annually, or more than one-half of the total imports, even if the supplies from Germany should somewhat increase. None of the larger European countries will materially help to cover the deficiency, any surplus material in Austria-Hungary being required by France and other countries. Canada has sent about one and a half million loads annually, but the reports obtained through the Governor-General by Dr. Lyons show conclusively what inroads have been made on the Canadian source of supply. On the whole, says Dr. Schliel, although I am far from joining those who would create a panic on the timber supply question, there is every prospect that any woods now planted in Great Britain and Ireland will yield a fine return by the time they are ripe for the axe. At present prices are very low, but that should not induce the present generation to disregard the future. Wood is an article that requires a long time to mature and forethought as regards to future supplies of it more than in respect of any other article. He then deals with the question of the waste lands of Great Britain and Ireland probably available, and of 41,809 square miles of waste assumes that probably one-half, or 20,000 square miles, are available for reafforestation. He next discusses forests as an object of industry, and shows that a

great variety of occupations depend on the products of forests as their prime materials, not only as regards construction, manufacture, furniture-making, &c., and the industries using minor forest products, but also as regards special industries which cannot spring into existence except in and around large forests with a sustained and regular yield. The articles produced by the latter are now mostly imported, but they could be to a considerable extent made by local labour if Great Britain and Ireland had extensive forests.

For Great Britain and Ireland, Dr. Schliel assumes that about one adult labourer will be required for every 100 acres after the forests have been created; while its initial work is going on, about 15 to 20 acres would supply work for one labourer throughout the year in preparation of the soil, draining, nursery work, planting, sowing, fencing, &c., &c. Assuming that the forest area of Great Britain and Ireland were during the next twenty years increased from 4,000 to 20,000 square miles, it would be necessary to plant annually some 500,000 acres, which would fully occupy at least 25,000 labourers, corresponding to a population of 125,000 people. After the forests had been created, they would give employment to about 100,000 labourers, corresponding to a population of half a million.

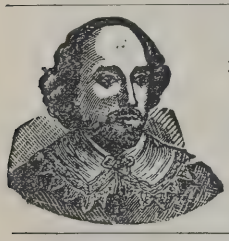
Before leaving this branch of the subject, Dr. Schliel cites the following important facts:—Prussia, Bavaria, Saxony, Wurtemburg, Baden, and Alsace-Lorraine have a combined population of 40,644,763 people. The labour connected with the forests of these countries has been estimated to be worth—Labour in the forests, 4,550,000*l.*; carriage of wood, &c., 3,900,000*l.*; collection of minor products, 1,000,000*l.* These earnings, 9,450,000*l.* in all, suffice for the maintenance of about 300,000 families, or 1,500,000 people. It has been further estimated that the prime material yielded by a forest occupies about four millions of people, so that the forests and industries dependent on them provide work for some seven millions of people, or one-sixth of the total population of the above-mentioned countries. A corps of nearly 10,000 men was furnished to the army by the forest guards of France in 1870.

It is needless to point the application of the data set forth in these examples to the case of a country like Ireland, where labour abounds, and where the area for reafforesting operations is estimated by so cautious and careful an observer as Dr. Schliel at a minimum of two million acres. My own estimate is five million acres, the old rule of 1 in 4 of forested to unforested land.

Dr. Schliel discusses the subject of forest revenue, but not in such detail as would be requisite. He has a special edition on the afforestation of Ireland, which will be read with great interest by all who earnestly address themselves to the subject. He discusses the general topography and drainage of the country, and after considering the mountain groups which enclose the central plains of Ireland, and the means which perform the drainage of the whole, he somewhat hastily, as I conceive, enters on a subject which the great French Forest Conservators have studied more profoundly and successfully than any other authorities in Europe, of which witnesses the great works are Surell and Cezanne on the torrents of Les Hautes Alpes, and the triumphs of forestry over the destructive torrents of the Duranee, on which ordinary engineering skill had laboured in vain for years. In conclusion, Dr. Schliel is kind enough to speak in terms of commendation of the organisation for dealing with the reafforesting of Ireland proposed in my bill of 1884.

CANALS v. RAILWAYS.

THE following letter by Mr. George Lester, of Llangollen, explains the way in which canal navigation is sacrificed to the interests of railways, and in consequence the interests of producers and consumers are likewise sacrificed:—



A few years ago it was customary when poor dividends were declared by the North Staffordshire Railway Company to lay the fault to the "said to be" non-paying canal, and it was not until Mr. Wedgwood made representations to the late chairman (Mr. Campbell) that careless and untrue statements ceased to be made in the half-yearly reports.

It has been stated since the North Stafford line has been constructed, the dividend has varied from ½ to 4½ per cent., and had it not been for the canal contributing some thousands per year over and above the 5 per cent. guaranteed (or 45 per cent. on the original capital), the railway dividends would have been still less, and had the canal been in other hands the railway would have collapsed.

Mr. Moore, as chairman of the London and North-Western Company, has thought well to make a scapegoat of the Birmingham canal; but it should be borne in mind forty-three times the original value has been given by the London and North-Western Company—4 per cent. on this amount guaranteed, equalising 172 per cent. Is not Mr. Moore's state-

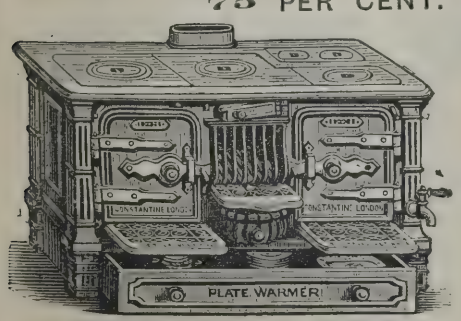
ment misleading and untrue—"that the earnings of the canal were absorbed in its maintenance," whereas it is to maintain the dividend on the enormous price paid (to obtain a monopoly), which is the real cause of bad trade in Birmingham, and materially injures the coal, iron, and potting interests of North Staffordshire? What railway in the kingdom could stand even twice its original value being given? It is a fact, railway maintenance absorbs 50 per cent., while maintenance of canals only absorbs 5 per cent.

This question of monopoly in transit affects not only the trade, the well-being and doing of England, but of the whole world. A speculative ring of 900,000,000*l.* has boycotted the trade of this country. This ring has nearly two hundred of its representatives in our Parliament. The Chairmen of Committees in both Houses are railway men. It can be proved that members of Parliament have received considerations not to oppose railway bills. But some members fly to perpetual pensions, tithes, oppressive rents; but the real plague spot is the railway monopoly, both in and out of our legislature. Two recently returned manufacturers state that English china clay, stone, flints, &c., are delivered at American potteries cheaper than in Staffordshire. With 40 per cent. to 50 per cent. duty, can it be wondered at that the state of our trade is so unsatisfactory? In railway monopoly we have before us what united capitalists can do. There are only two courses open. Either for chambers of commerce to be universally supported by the trading community (each district to have a large reserve fund); or, for the people of this country to unite as one man to break up a monopoly which is ruining us socially, commercially, and politically.

THE SETTLED LAND ACT IN RELATION TO LIGHT AND AIR.

ON Wednesday an important case was brought before Mr. Justice Stirling, as vacation judge, in which the application of the Settled Land Act, 1882, was involved. It was a motion on behalf of Adolph Fass, lessee of No. 23 Courtfield Gardens, South Kensington, to restrain the defendants Colonel Gunter, the lessor, and James Whitaker, builder, from obstructing the light at the back of the plaintiff's house. On July 20, 1880, Colonel Gunter, the owner in fee, leased the premises to Mr. Radford, together with all ways, rights, and appurtenances for 99 years from March 25, 1875. On March 27, 1883, Mr. Radford leased the house and premises to the plaintiff for twenty-one years from December 25, 1882. Colonel Gunter was also tenant for life under the will of Robert Gunter of the land at the back of Courtfield Gardens. On January 21, 1886, a building agreement was entered into between Colonel Gunter as tenant for life under the Settled Land Act, 1882, and James Whitaker with respect to the land at the back of Courtfield Gardens. Mr. Whitaker then began to build houses 53 feet high in place of a wall 7 feet 10 inches high at a distance of from 10 feet 8 inches to 13 feet 8 inches from plaintiff's house. The plaintiff now moved for an injunction.



Counsel for the plaintiff said that under the old law Colonel Gunter, as owner in fee of the plaintiff's house, had granted the light to the plaintiff, and as tenant for life of the adjoining premises he could not derogate from his own grant, and take the light away. Before the passing of the Settled Land Act, 1882, Colonel Gunter could not block out the light, and that Act had not taken away the plaintiff's right.

Counsel for defendants said that Colonel Gunter was, under the Settled Land Act, a trustee for the whole estate, and had power to grant a lease free from the plaintiff's easement.

Mr. Justice Stirling said that the question was one of legal right. The title of the plaintiff rested on a grant alleged to be made by Gunter to Radford, and passed from Radford to the plaintiff, and also on the principle that a grantor cannot derogate from his own grant. It was contended on behalf of the defendant that, as tenant for life under the Settled Land Act, 1882, he was trustee for all parties, and could grant the lease to Whitaker discharged from the interests of the plaintiff. The intention of the legislature was not so clear as he would have wished, but he had come to the conclusion that under section 20 of the Act a lease might be made to override all the estates and interests subsisting or to arise under the settlement, except easements otherwise binding on the tenant for life or his successors. Now this easement was not binding on the successors of Colonel Gunter. Then under section 50 of the Act the consent of the plaintiff as assignee for value was not required, unless he was in possession of the settled land or part thereof. In his lordship's opinion the Act clearly distinguished between settled land and easements, and the plaintiff could not be considered in possession of settled land. The defendant, Colonel Gunter, therefore, was not bound to obtain the consent of the plaintiff in granting a lease, and the motion failed and must be dismissed.

BUILDING ORGANISATION IN FRANCE.

THE greatest difference between the building organisation of England and that of France is in respect of the sub-contractor. In England he is sometimes the employé of the builder: sometimes he is thrust on the job—as happens with specialists—to the annoyance of the general contractor, who always believes he could find a better substitute. One of the builders' societies would hardly care to recognise him, and, however able he might be in construction or in art, the Institute of Architects keeps him at as a remote a distance as if he were a hodman and wore dusty clothes. No matter what kind of trade or calling he may follow, he is sure to be isolated.

The French sub-contractor, on the contrary, is not afraid that the general contractor can hamper him, for he and men like him divide the work between them. The general contractor may be said to be unknown in France, and the architect has to deal not with one man or with one firm, but with several, even when his building is not of much importance. Here in England, any one who wants to have a house or a factory or a palace erected can easily find a builder who will supply him with plans and carry them into execution. That Frenchman must have an exceptional power of government who dispenses with an architect, and trusts himself to the representatives of the various trades.

A body of English sub-contractors would be created with difficulty. Where is the society which represents glass-painters, tile-makers, ventilating engineers, carvers, concrete-workers, or one of the makers of the numerous specialities which are specified by the architects? In France, and more especially in Paris, there are almost as many *chambres syndicales*, or associations of employers, as there are trades to be undertaken. Let us glance at a few of them. There is the chamber for contractors of masonry, which has a mutual assurance against the risks of accidents in works that are executed in the departments of Seine and Seine-et-Oise. The office is open daily from ten to five, and the council hold their meetings once a month. Many of the masons are men of position and belong to the Legion of Honour. The contractors for carpentry have also their assurance society in connection with their chamber. The council meets once in two months. The contractors for joinery and parquetry do not need an assurance society. The council have monthly meetings, and there is a committee who are always ready to examine all communications relating to the price-lists which are issued. For it must be remembered that in Paris there are official prices, which are issued from time to time, for every kind of work. It is to the interest of contractors that a constant watch should be exercised over the fluctuations. The roof-coverers and plumbers form one chamber. In addition to the assurance society against accidents, they have another, which makes provision against losses by fire caused by the men, and for which contractors might be held responsible. The marble-workers have two groups in their chamber, one relating to buildings and the other to monuments. There are also societies for heating, gas-lighting, electric bells, &c.; painters, paviors, glaziers, locksmiths, tapestry-workers, and so on. Trellis is largely used in Paris to conceal dead walls, and the *treillageurs* have their chamber and bureau. The house-breakers or contractors for demolitions, the carters who convey building materials, have each a representative body, as well as the sculptors, glass-painters, and paper-stainers.

In addition there is a general administrative council that is constituted of officers from the different societies. By means of it much is done towards keeping the trades within their legitimate provinces, and towards insuring the recognition of rights. When so many independent contractors are occupied with a building there is a risk that one set of men may impede the work of another set. It is, therefore, an advantage to have a central authority that is always ready to define rights.

It is not to be assumed that every contractor is a member of the *chambre syndicale* of his trade. There is nothing compulsory about joining, and the majority do not belong to the societies. But every chamber has sufficient members to exercise influence, and in most cases with benefit to the entire trade.

Another and no less effective aid towards conciliation exists in the Conseils de Prud'hommes, of which the origin is so remote that it cannot be traced. In cases where the damages do not exceed 200 frs. their judgment is final; in cases where a larger amount is sought there is an appeal to the Tribunal de Commerce. In a list before us we find that building is represented among the Paris Prud'hommes by two master joiners, two master carpenters, one master mason, a quarry-owner, a manufacturer of plaster, two locksmiths or iron-workers, two makers of paints, two makers of room papers, and a brick-maker, besides workmen belonging to several of the trades. In building cases a tribunal of this kind has more knowledge than a tribunal of lawyers can have, and is sure to give more attention to the details. Moreover, the cost is infinitesimal if compared with what would have to be paid if the litigation occurred in England.

DRYING STEAM.

FEW things have created such a revolution in the world as the introduction of steam for a public servant, and its utility as a motive power gave a stimulus to mechanical ingenuity which has not ceased to invent new mechanical apparatus nor to improve on old types. Little thought in comparison has, however, been given to the steam which is the life of the vast array of mechanism employed all over the world. Possibly there is something yet to be done in this direction. Indeed, a most valuable result has already been arrived at by means of a process devised by Messrs. Boys & Cunynghame, which gives dry steam instead of the normal water-charged steam. On the importance of this there is no necessity to dwell, though the simplicity of the process should be noted. A reference to the illustrations will explain the principle of the apparatus, or "steam-separator," as it is named, of Messrs. Boys & Cunynghame, and which is so valuable a departure and so decidedly in advance of steam-traps, &c.—though these, without drying the steam, are of use in carrying off such water as has condensed in natural order and fallen to the bottom. The process of extracting the water is similar to that of the Swiss cream-separator that divides the milk from the cream; for, in the same manner, this separator absolutely wrings the particles of water from the steam. The apparatus consists of a circular chamber, placed near the steam-engine, into which the steam is led tangentially, so as to produce a whirling motion. Thus the contents of the chamber are spun round at a high velocity, the effect being that the water contained in the steam, being much heavier than the dry vapour, is flung to the sides and is conducted downwards and allowed to escape from the bottom, whilst the dry steam is taken off to the engine by means of a pipe from the centre. The orifice in the chamber is made proportionate to the amount of steam required, and this, of course,

ARTISTIC SANITARY WALL-HANGINGS.

bears a certain proportion to the ports of the engine. With so simple and efficient a contrivance there should be no more broken cylinder covers or leaking glands. The invention is being brought out by Mr. J. C. R. Okes, of 39 Queen Victoria Street, London, and Messrs. Mather & Platt have taken up the invention for Manchester.

BUILDERS' SHEDS IN GLASGOW.

A CORRESPONDENT of the *Glasgow Herald* says:—When a building is to be erected here, by what right does the builder put up a shed occupying usually the whole breadth of the pavement, and sometimes even more, or who gives him authority to do so? This practice is a great nuisance, and is not tolerated in some cities, and should certainly not be allowed here, as it puts the citizens to very great inconvenience, interrupting the traffic, and compelling people to walk on the causeway, endangering their lives from cabs and carriages passing. A very flagrant instance of this stupid and dangerous practice is the shed erected to-day in the Great Western Road, where M'Lerie the cab proprietor's shed stood, which was recently burned. Although the pavement here is extra wide—indeed, twice as wide as in many streets—the builder has had the impudence to appropriate the whole breadth of it, to the great inconvenience of passers-by. This practice is also very hard upon the shopkeepers who may be at either end of the barricade, as it must injure their business by forcing passengers off the pavement when they are coming near their shops. Builders ought not to be allowed to occupy more than a foot or two of the pavement. In London I have often noticed they were not allowed to encroach even so much as a single foot on it, and the London practice should be imitated here, and builders not allowed to encroach at all on the footway. There is another matter the authorities ought to look into at once, that is the state of the footpaths. In many quarters—indeed, all over the city—they are in very bad condition, a heavy shower of rain forming large and sometimes pretty deep pools. In several places, too, the flags are very unevenly laid, and often rounded edges cause them to be very dangerous to the unwary wayfarer; and they often slope far too much to the kerbstone, and should be properly levelled. Whoever should look after this matter does not seem to do his duty as he ought to do it, and should be stirred up at once.

THE FORTH BRIDGE.

THE third annual excursion of the Edinburgh Association of Science and Art to the Forth Bridge took place on Saturday. The members, to the number of 300, proceeded by special train to North Queensferry, where the party examined the structure on the north side, and were allowed upon a portion which is still to be raised 60 feet higher. After inspecting the other important section they crossed by steamer to the south side. The visitors had the pleasure of thoroughly examining the engineering works in which are to be seen the principal parts of the permanent structure under construction, and where the different sections are being fitted up before being placed in position. The members were much struck with the very complete character of the works and immense size and weight of the machinery employed. The drawing offices were inspected, and much interest was taken in a large model of a portion of the bridge, which impressed on the visitors the sense of the gigantic undertaking. The thanks of the Association were conveyed by Mr. John Melrose, president, to the contractors, Messrs. Tancred, Arrol & Co., and a vote of thanks to the gentlemen who conducted the members over the works closed a very pleasant afternoon.

THE SCIENCE AND ART DEPARTMENT AND BUILDING CONSTRUCTION.

THE following description of the examinations on "Building Construction," which will henceforth take place, is given in the new directory just issued.

As the object of this course of instruction is to lay the foundation of a sound knowledge of the principles, as well as of the practice, of building construction, and so lead the workman to labour with his head at the same time as with his hands, the teacher should not, necessarily, attempt to push the student through the whole of the subjects enumerated in this syllabus, but should limit the range of his tuition according to the time at his command and the intelligence of the pupils.

A larger number of questions will be set in the examination papers for the elementary and advanced stages than the candidate will be allowed to attempt, so that he will, to a certain extent, be able to show his knowledge in such branches as he

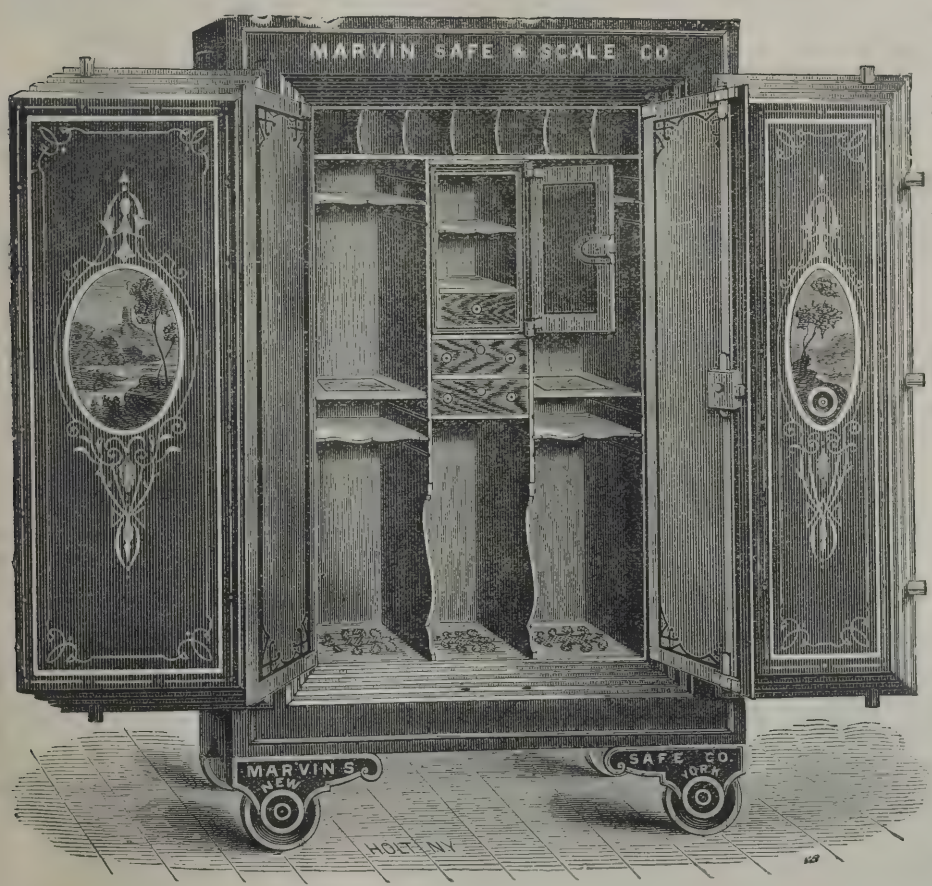
MARVIN'S

AMERICAN

FIRE & BURGLAR PROOF SAFES,

PATENT WELDED STEEL AND IRON,



STRONG-ROOM DOORS & BANKERS' VAULTS,

NEW YORK, U.S.A., and LONDON, E.C.

BY SPECIAL APPOINTMENT

CONTRACTORS TO THE UNITED STATES GOVERNMENT TREASURY AND POST OFFICE.

FIRE AND BURGLAR PROOF SAFES.

Manufactured with the newly patented "Tongue and Groove" Improvement, "Forged Angle Frame with Sliding Back-plate," "Annealed Hinges," &c. &c. Body of heavy plate iron, secured by angle iron corners and welded refined iron frame and an entire inside iron lining.

Our new patterns give a greater thickness of Fire-proofing than in any other makes. Doors are fitted with round bolts and "Yale" Combination Lock of 1,000,000 changes. Inside doors are of plate-iron secured by suitable bolt work and key lock.

ABSOLUTELY PROOF

Against Blasting, Drilling, and Pick Lock.

Estimates and Designs furnished on application for all sizes and thickness of burglar proof vault doors; also for all styles of vault work.

Every description and style of Fire and burglar proof Safes for Merchants, Bankers, Jewellers, &c. Illustrated Catalogue, with full description, on application.

EUROPEAN BRANCH:

66 QUEEN STREET CANNON STREET, LONDON, E.C.

may, from circumstances, have paid special attention to. For instance, a student better acquainted with iron than wooden structures will be able to select a question on ironwork in preference to one on woodwork. In order, however, to insure that special attention shall not be given to work of one description only, a certain number of the questions given will be compulsory, *i.e.*, the candidate must attempt these, and unless he shows a sound knowledge of work of more than one kind, by answering a fair proportion of them, the rest of his paper will not be considered.

Moderately good drawing, showing an intelligent knowledge of the subject, will always be awarded higher credits at the examination than more highly finished drawings exhibiting an ignorance of constructive details.

First Stage, or Elementary Course.

It is assumed that the student has already mastered the use of the following drawing instruments :—rulers, ordinary and parallel; ruling pen; compasses, with pen and pencil bow-sweeps, as well as the construction and use of simple scales, such as 1, 2, 3, or more feet to the inch, showing inches; or such as $\frac{1}{2}$, $\frac{1}{3}$, $\frac{1}{4}$, $\frac{2}{3}$, $\frac{3}{5}$, $\frac{5}{8}$, or other fraction of full size, or of any given scale or drawing: also the meaning of such terms as Plan, Elevation (front, back, or side), Section, Sectional Elevation.

He should understand the object of bond in brickwork, *i.e.*, English bond, Flemish bond, or English bond with Flemish facing, and how it is attained in walls up to three bricks thick in the following instances, viz., footings with offsets, angles of buildings, connection of external and internal walls, window and door openings with reveals and square jambs, external gauged arches (camber, segmental, and semicircular), internal discharging arches over lintels, and inverted arches.

He should know where to put wood bricks, or plugging, and their use; the construction and uses of brick corbeling, and the construction of trimmer arches in fireplaces.

He should be able to give sections and elevations to scale of the following kinds of mason's work, viz., uncoursed and coursed rubble, block in course, and ashlar, with their bond, and the proper dimensions of the stones as to height, width of bed, and length; and of the following dressings, viz., window sills, window and door jambs, plain window and door heads, door steps, string courses, quoins, copings, common cornices, blocking courses; and of the following methods of connecting stones, viz., by cramps, dowels, joggles, and lead plugs.

He should be able to show how to join timbers by halving, lapping, notching, cogging, scarfing, fishing, and mortice and tenon, as applied to wall plates, roof timbers, floors, ceilings, and partitions.

He should be able to draw, from given dimensions, couple, collar, and kingpost roofs, showing the details of the framing and of the ironwork.

He should be able to draw, from given dimensions, single, double, and framed floors, with or without ceilings beneath them; showing modes of supporting, stiffening, and framing the timbers, trimming round hearths and wells of stairs; also floor coverings of boards or battens, rebated and filleted, ploughed and tongued, and laid folding, with straight or broken joints, bevelled or square heading joints.

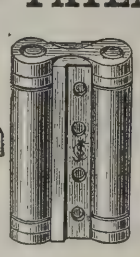
He should be able to draw in elevation, from given dimensions, a framed partition with door openings.

He should be able to draw in elevation, and give vertical and horizontal sections of solid door frames and window frames.

He should be able to describe, by drawings, beadings of different kinds, dovetailing, cross-grooving, rebating, plough-grooving, chamfering, rounded nosing, and housing.

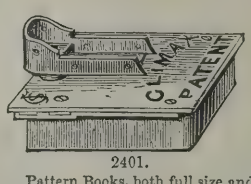
He should be able to draw in elevation, and give vertical and horizontal sections of the following doors, viz., ledged, ledged and braced, framed and braced, panelled, and the mode of putting them together, position of hinges and furniture; as well as to describe, by drawing, the following terms as applied to panelled doors, viz., square and flat, bead butt, bead flush, moulded, all on one or both sides.

He should be able to draw in elevation, and to give vertical and horizontal sections of the following window-sashes and frames, viz., single or double-hung sashes with square, bevelled, or moulded bars, and cased frames; casement sashes hung to solid frames, with method of hanging and securing in each case.

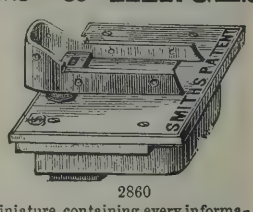


He should be able to show, in elevation and section, the lead-work connected with chimneys, ridges, hips, valleys, gutters, and lead-flats.

He should be able to give an elevation and section of the slating of a roof laid with duchess or countess slates on boards or battens.



He should be acquainted with the proper cross section for cast-iron beams for use in floor girders or bressummers, or as cantilevers, and be able to draw such a section in its right proportions from given dimensions of flanges.



MELBOURNE INTERNATIONAL EXHIBITION, 1880, THE GOLD MEDAL
In addition to FIRST-CLASS HONOURS, was awarded to
JAMES CARTLAND & SONS,
Cabinet Builders and Naval Brass Founders,
BIRMINGHAM.
London Show-rooms: 40 Holborn Viaduct, E.C.
The extent, variety, quality, and finish of articles manufactured at this establishment cannot be excelled.
CARTLAND'S PATENT HELICAL, CLIMAX DOOR SPRINGS & HINGES.

CAUTION.
Ironmongers, Builders, and others are requested to see that the Trade Mark is on each Spring, as the Patentees are informed that spurious imitations of the
"CLIMAX SPRING HINGES"
are being sold, which have neither the Power or Durability of Cartland's Patent Climax Door Springs and Hinges.

2401.

2860
Pattern Books, both full size and Miniature, containing every information, may be obtained through any Merchant or Factor on application. All Goods for Export are carefully packed in Cartoon Boxes, and distinctly labelled with orange-coloured labels, bearing our Trade Mark, as above.

ART PLATES FROM "THE ARCHITECT."

Proof Impressions of the following Illustrations which have appeared in "THE ARCHITECT" can now be obtained in a separate form suitable for Framing :—

The History of Art.

In Two Plates, reproduced from the Splendid Painting around Cupola, in Place St.-George's, Paris
BY M. FRANCOIS EHRMANN.
Showing Typical Figures of Ancient and Modern Styles of Art.

Size, Thirty-six Inches by Fourteen Inches.
Price One Shilling each; by post, carefully packed inside patent roller, One Shilling and Threepence each.

May be obtained from all Newsagents or Booksellers, or from the
Publishers, GILBERT WOOD & CO., 175 Strand, London, W.C.

He should be able to draw in elevation, from given dimensions and skeleton diagrams, ordinary iron roofs up to 40 feet span, showing the sections of different parts and methods of connecting them.

Second Stage, or Advanced Course.

In addition to the subjects enumerated for the elementary course—in all of which questions of a more complicated nature may be set, combining work done by the different trades—the knowledge of the students will be tested under the following heads, viz. :—

1. Freehand sketches explanatory of any details of construction, such as the joints of iron and wooden structures, and other parts requiring illustration on an enlarged scale. These sketches may be roughly drawn, provided they are clear and capable of being readily understood.

2. The nature of the stresses to which the different parts of simple structures are subjected, as follows :—

In the case of beams either fixed at one or both ends, or supported or continuous, the student should know which parts of the beam are in compression and which in tension.

He should be acquainted with the best forms for struts, ties, and beams, such as floor joists exposed to transverse stress.

He should know the difference in the strength of a girder carrying a given load at its centre or uniformly distributed.

In the ordinary kinds of wooden or iron roof trusses, and framed structures of a similar description, he should be able to distinguish members in compression from those in tension.

He should be able, in the case of a concentrated or uniform load or any part of a beam supported at both ends, to ascertain the proportion of the load transmitted to each point of support.

3. The nature, application, and characteristic peculiarity of the following materials in ordinary use for building purposes, namely :—

Bricks of different kinds in common use, York, Portland, Caen, and Bath stones (or stones of a similar description), granite, pure lime, hydraulic lime, Portland and Roman cement, mortars, concretes, grout, asphalte, timber of different kinds in common use, cast and wrought iron, lead.

4. Constructive details as follows :—

The ordinary methods of timbering excavations, such as for foundations to walls, or for laying down sewers ; the erection of bricklayers' and masons' scaffolding ; the construction of travellers ; the use of piles in foundations, hoop iron bond in brickwork, diagonal and herring-bone courses in ditto, damp-proof courses, bond timber in walls and the objections to it.

He should know how bricks are laid in hollow walls, window or door openings with splayed jambs, flues, chimneys, fireplaces, and arches up to about 20 feet span ; how mortar joints are finished off, and the thickness usually allowed to them ; why bricks and stones ought to be wetted before being laid.

He should be acquainted with the construction of brick ashlar walls, rubble ashlar walls, stone stairs, wooden stairs (both dog-legged and open newel), skylights, fire-proof floors (such as brick arches supported on rolled or cast iron girders, Fox & Barrett's and Dennett's patent concrete floors), circular and egg-shaped drains, roofs of iron or wood, for spans up to 60 feet ; the fixing of architraves, linings, and skirtings to walls, shutters to windows, lath, plaster, and battening to walls, roof coverings of tiles and zinc, slate ridges and hips.

Written answers will be required to some of the questions.

Examination for Honours.

The candidate will have to furnish a design for a building, or part of a building, in accordance with given conditions, which design he will be allowed to draw out at his own home.

He will be called upon to answer in writing—illustrated by sketches, either freehand or to scale, as directed—questions on all the subjects previously enumerated for the elementary and advanced courses.

He must possess a more complete knowledge of building materials, their application, strength, and how to judge of their quality, and in the case of iron, of the processes of manufacture, and the points to be attended to in order to insure sound castings and good rivetting.

He must be able to solve simple problems in the theory of construction, and to determine the safe dimensions of iron or wooden beams subjected to dead loads.

In ordinary roof trusses and framed structures of a similar description, he must be able to trace the stresses brought into action by the loads, from the points of application to the points of support, as well as to determine the nature and amount of the stresses on the different members of the truss, and, consequently, the quantity of material required in each part.

In ordinary walls and retaining walls, he must be able to ascertain the conditions necessary to stability, neglecting the strength of the mortar.

BRADSHAW'S LIMMER ASPHALTE

Messrs. BRADSHAW & CO., being Sole Agents in the United Kingdom for, and possessing proprietary rights in, the Freehold Mines of the German Asphalte Company (of which Mr. C. W. Bradshaw is also a Director), situated at Limmer, near Hanover, and Vorwohle, Brunswick, possess special facilities for reliable and prompt delivery of their celebrated "LIMMER ASPHALTE" at low rates, either for sale in its natural state or ready for laying by their own workmen in any part of the United Kingdom. EACH BLOCK supplied from these Mines, besides bearing the impress of the Company, is stamped with the words "BRADSHAW & CO." The attention of Architects, Engineers, &c., is particularly called to the fact that the "LIMMER ASPHALTE" is especially suitable for use in the construction of Reservoirs, Roofs, &c., where water-tightness is extremely essential. For such purposes **Over 2,000,000 (Two Millions) of Square Feet of "Limmer Asphalte"** have been executed by Messrs. BRADSHAW & CO.; while for Paving purposes **Over 50 Miles of "Limmer Asphalte" Footways** have been laid by them in the LONDON DISTRICT ALONE. Messrs. BRADSHAW & CO. will be happy to forward Prices, Samples, and Testimonials, and give all information on application to:—

LEEDS.—Oct. 9.—Designs are invited from Architects of Leeds for proposed Art Gallery and Museum. Mr. G. W. Morrison, Town Clerk, Leeds.

LEWES.—Oct. 9.—Designs and Estimates are invited for Public Hall and Offices, by way of addition to present Buildings. Mr. A. Holt, Borough Surveyor, Town Hall, Lewes.

CONTRACTS OPEN.

ABERDEEN.—Sept. 15.—For Building Warehouse, Shore Lane. Messrs. Matthews & Mackenzie, Architects, 255 Union Street, Aberdeen.

AMBLE.—Sept. 13.—For Building Two Cottages. Mr. J. Stevenson, Harbour, Amble.

BATLEY.—Sept. 22.—For Building Villa Residence, Upper Batley. Mr. Walter Hanstock, Architect, Branch Road, Batley.

BALAGAVENY, FORGUE.—Sept. 11.—For Building Milk-house. Mr. James Duncan, Architect, Turriff.

BALLOCH.—Sept. 27.—For Removing Bridge over the River Leven and Erecting Iron Girder Bridge. Messrs. Crouch & Hogg, C.E., 175 Hope Street, Glasgow.

BARNSLEY.—Sept. 21.—For Building Bakery. Mr. Frederic Smith, Architect, 29 Bridgwater Chambers, 6 Brown Street, Manchester.

BEESTON.—Sept. 10.—For Building Wesleyan School Chapel. Mr. John Wills, Architect, Victoria Buildings, Derby.

BELFAST.—Sept. 22.—For Construction of Waterworks (Contract No. 2). Mr. L. L. Macassey, C.E., Waterworks Office, Belfast.

BELFAST.—Sept. 16.—For Building School, Lecture-hall, and Two Dwelling-houses. The Secretary of the Building Committee, 43 Foreman Street, Belfast.

BINGLEY.—Sept. 11.—For Building Weaving Shed, &c. Mr. S. Jackson, Architect, 33 Kirkgate, Bradford.

BOLTON.—For Iron or Wood Span Roof over area 1,500 to 1,800 yards. Mr. Winder, Solicitor, Bolton.

BRADFORD.—Sept. 16.—For Building Business Premises, Rebecca Street. Mr. W. Rycroft, Architect, Bank Buildings, Manchester Road, Bradford.

BRADFORD.—Sept. 11.—For Building Five Houses, Stabling, Shed, &c. Mr. G. C. Gamble, Architect, 225 Leeds Road, Bradford.

BRISTOL.—Sept. 23.—For some Alterations, Fixtures, and Furniture at the Hot Wells Branch Library, Woodwell Lane. Mr. J. Thomas, City Surveyor, Bristol.

BRIXHAM.—Sept. 10.—For Building Coastguard Station and Battery. The Director of Works Department, Admiralty, 21 Craven Street, W.C.

BROUGHTON-IN-FURNESS.—Sept. 15.—For Building Four Cottages. Mr. W. Coward, Saw Mills, Coniston.

BURNLEY.—For Alterations to Two Shops, St. James's Street. Mr. Thomas Dean, Architect, Burnley.

CANTON.—Sept. 20.—For Building Board Schools for 1,119 Children. Mr. E. M. Bruce Vaughan, Architect, Borough Chambers, St. Mary Street, Cardiff.

CARLISLE.—Sept. 16.—For Erection of Public Slaughter-houses. Mr. H. W. M'Kie, City Surveyor, Town Hall, Carlisle.

COCKERMOUTH.—Sept. 18.—For Building Shop and Warehouse, Station Street. Mr. R. S. Marsh, Surveyor to the Local Board, Cockermouth.

COLNE.—Sept. 15.—For Building Syphon Chamber and other Works at Waterside for the Colne and Marsden Local Board. Mr. H. Bancroft, C.E., 83 Mosley Street, Manchester.

COMBER.—Sept. 11.—For Restoration of Presbyterian Church. Mr. Robert Henry, M.D., Comber, Ireland.

COVENTRY.—Sept. 14.—For Alterations to Cemetery Lodge. Mr. E. J. Purnell, City Surveyor, Coventry.

CUBLINGTON.—For Repair and Part Reseating Church. Mr. J. Biggs, Manor Farm, Cublington.

DUBLIN.—Sept. 10.—For Construction of Girders to Carry Water-pipes across Cookstown River. The City Engineer, City Hall, Dublin.

DUMFRIES.—Sept. 18.—For Building Post Office. Mr.

H. W. Primrose, Secretary, H.M. Office of Works, Parliament Square, Edinburgh.

FORRES.—Sept. 18.—For Rebuilding Farm Steading, Buchtiby. Mr. John Milne, Architect, Elgin and Forres.

GATESHEAD.—For Altering Premises into Dwelling-houses. Mr. George Bolam, 12 West Street, Gateshead.

GORDONSTONE.—Sept. 11.—For Building Steading of Offices, Middle Hangus, and other Works. Mr. James Duncan, Architect, Turriff.

GRANTOWN.—Sept. 10.—For Building Dwelling-house and Hall for Seafield Memorial Church. Mr. Donald Grant, Writer, Grantown.

GRAYS.—Sept. 11.—For Erection of Coal Shed on the Saltings for the Metropolitan Asylums Board. Messrs. H. Jarvis & Son, Architects, 29 Trinity Square, Southwark, S.E.

GREENOCK.—Sept. 21.—For Works in Building Holmscroft Public School. Mr. G. Williamson, 2 Bank Street, Greenock.

HALIFAX.—Sept. 30.—For Building Nine Cottages at Stannary. Messrs. George Buckley & Son, Architects, Waterhouse Street, Halifax.

HORBURY.—Sept. 14.—For Building Two Houses, School Lane. Mr. Fred. Broadbent, Architect, 3 Bradford Road, Dewsbury.

HORSFORTH.—Sept. 20.—For Construction of Reservoir with Embankment, Puddle Wall, &c. Messrs. McLandsborough & Preston, C.E., The Exchange, Bradford.

HORWICH.—Sept. 14.—For Construction of Fork Line. Specifications, &c., at the Engineer's Office, Hunt's Bank, Manchester.

HULL.—Sept. 15.—For Extending Platform Roofs and Erecting Lock-up Sheds, Paragon Station. Mr. William Bell, Architect, North Eastern Railway, York.

IPSWICH.—Sept. 13.—For Sinking an Artesian Well at the Borough Lunatic Asylum. Mr. E. Buckham, Borough Surveyor, Town Hall, Ipswich.

IVYBRIDGE.—Sept. 10.—For Building Residence, Stables, and Cottage. Mr. W. M. Tollit, Architect, Totnes.

JERSEY.—Sept. 14.—For Building Telegraph Cable House at Plemont. The Secretary, H.M. Office of Works, 12 Whitehall Place, S.W.

KEITH.—Sept. 16.—For Repairs and Additions to Manse and Parish Offices. Mr. F. D. Robertson, Architect, Fife-Keith.

KENSINGTON.—Sept. 13.—For Cast-iron Tank, Stanchions, Lump Wrought-iron Girders, Steam Engines and Boilers, Washing Machines, Wringers and Mangles, Shafting and Gearing, Tools, Apparatus, &c., complete Drying-houses and Closets, Steam Coils, &c. Mr. T. Verity, Architect, 27 Regent Street, S.W.

LANCASTER.—Sept. 15.—For Building Recreation Hall at the Royal Albert Asylum. Mr. W. Wright, Surveyor, Lancaster.

LEEDS.—Sept. 11.—For Building Mission Hall, Kirkstall Road. Mr. W. H. Beevers, Architect, 22 Bond Street, Leeds.

LINGFIELD.—Sept. 18.—For Building Dwelling-house and Office, Stable Buildings, and Vineries, at Rowlands. Messrs. John Colson & Son, Architects, 45 Jewry Street, Winchester.

LONDON.—Sept. 15.—For Building Offices. The Rock Freehold Land Society, 38 Finsbury Pavement, E.C.

LOWER CLAPTON.—Sept. 13.—For External and Internal Painting and Repairs. Mr. F. W. Crane, 61 Bartholomew Close, E.C.

MANCHESTER.—Sept. 11.—For Construction of a Wrought-iron Bridge across the River Medlock, at Boardman Street. Drawings and Specifications at the City Surveyor's Office, Manchester.

NOTTINGHAM.—For Pulling Down Two Houses and Building Shop and Residence. Mr. F. M. Palmer, Architect, 2 Lister Gate, Nottingham.

NOTTINGHAM.—For Brickwork (labour) for Twelve Villa Residences, Lenton Boulevard. Mr. W. Graham Lees, Architect, King John's Chambers, Nottingham.

PAISLEY.—Sept. 22.—For Enlargement and Reconstruction of Passenger Stations on Glasgow and Paisley Joint Line, Messrs. Blyth & Cunningham, Engineers, Edinburgh. Mr. J. Hay, Secretary, Bridge Street Station, Glasgow.

PETERBOROUGH.—Sept 16.—For Building Cottage. Mr. J. C. Gill, Waterworks Engineer, Queen Street, Peterborough.

PETERHEAD.—Sept. 20.—For Building Prison. Mr. William Donaldson, Secretary to the Prison Commissioners for Scotland, 130 George Street, Edinburgh.

R. ADAMS,

17 BLACKMAN STREET & 7 GREAT DOVER STREET, LONDON, S.E.,

INVENTOR and PATENTEE of the

SAFETY WINDOW WITH REVERSIBLE SASHES

FOR INEXPENSIVE AND PERPETUAL CLEANLINESS,

Which has gained at the INTERNATIONAL HEALTH and SANITARY EXHIBITIONS

Two Gold, Four Silver, and Four Bronze Medals, and Sixteen Diplomas of Merit.

IMPORTANT NOTICE.

The Patentee has been advised by several of his friends to form a Company for the Manufacture of the above-mentioned Sashes in larger numbers, for the supply of the Trade and for the Home, Colonial, and Foreign Markets. Hitherto he has only supplied the Fittings, except under very special circumstances. He now proposes to manufacture the Sashes complete with Fittings.

Provisional Protection has just been granted for another Patent, whereby the Sashes will be greatly reduced in price, and, consequently, brought within the requirements of every Architect and Builder.

If any of the readers of this journal wish to receive further particulars or to take Shares in the proposed Company, they are requested to make early application to the Patentee, as it is expected that the larger number of the Shares will be privately subscribed.

Applications for Shares will be taken in the order in which they are received.

SANDBACH.—Sept. 13.—For Supply and Erection of Heating Apparatus. Mr. J. Vawdrey, Manager, Central Stores, Bold Street, Sandbach.

SHOREHAM.—Sept. 14.—For Building Chimney and other Works at Workhouse. Mr. E. Cripps, Clerk to the Guardians of Steyning Union, Shoreham.

TIPTON.—Sept. 16.—For Building Board School for Infants, Great Bridge. Mr. Edward Pincher, Architect, High Street, West Bromwich.

WAKEFIELD.—Sept. 18.—For Building Cottages, Westgate End. Mr. A. Hart, Architect, Thompson's Yard, Westgate, Wakefield.

WANDSWORTH.—Sept. 23.—For Building Lying-in Wards at the Workhouse, Garratt Lane. Mr. T. W. Aldwinckle, Architect, 2 East India Avenue, Leadenhall Street, E.C.

WARKLEIGH.—Sept. 13.—For Additions, &c., to Farmhouses. Mr. James Crocker, Architect, Exeter.

WEEDON.—Sept. 11.—For Repairs and Alterations to Garden Gate Public-house, for Messrs. P. Phipps & Co., Northampton and Towcester Breweries. Messrs. John Ingram & Son, Architects, Hazelwood Road, Northampton.

WEDNESBURY.—Sept. 20.—For Building Board Schools, Caretaker's House, &c., King's Hill. Mr. Edward Pincher, Architect, West Bromwich.

Specialities—Patent Frosted Gold, Crystal Damask and Raised Flock Decorations.

GRUNDY'S PATENT
WARM-AIR
VENTILATING FIRE GRATE.
The novelty, superiority, and advantage of this patent consist in the heating surface being greater than any other Fire-grate introduced to the public. It is very simple in construction, and is made in the form of a Stove, the back of which is semicircular in shape, with gills behind and smoke-nozzle on top, all cast in one piece. The same can be attached to any design of a Register or Stove front. It is very suitable for schools, class-rooms, waiting-rooms, hospitals, offices, dormitories, and dwelling-houses, from the cottage to the mansion. Design and specification post free on application.
TESTIMONIALS.
"9 Victoria Chambers, Westminster, S.W.: June 10, 1884.
"SIR,—I have much pleasure in testifying to the efficiency of your patent warm-air fire grate. It has been very successful, and given every satisfaction where I have used it. Yours, &c.,
"To Mr. Grundy. JAMES WEIR, F.R.I.B.A."
"6 John Street, Bedford Row, W.C.:
"December 16, 1885.
"DEAR SIR,—I have now had an opportunity of testing your patent grate, and am glad to be able to say that I am most agreeably disappointed, because, as you are aware, I was rather sceptical about its powers when you showed it to me; but now I can say it answers admirably, and heats abundantly my porch-conservatory.—I am, yours truly,
"R. S. LANDER, F.R.I.B.A.
"To Mr. John Grundy."
From James Garry, Esq., Architect, West Hartlepool, July 1884.
"DEAR SIR,—I have very great pleasure in stating that the first stove, or patent warm-air ventilating fire grate, adopted by me in school at Seaton, and a second in a Cocoa Palace, have given such satisfaction that I now order eleven to be inserted in New Upper Grade Schools in course of erection at West Hartlepool. They are the most economical, efficient, and easily managed stove at present before the public.—Mr. John Grundy."
From Hon. and Rev. G. G. C. Talbot, M.A., Withington, Cheltenham.
"DEAR SIR,—You will be gratified to hear that the school is completely warmed by your new grate. It is the most economical and efficient that I have ever seen.—Mr. John Grundy."
Society of Architects, Architectural and Building Trades Exhibition, 1885:—"5 Great James Street, Bedford Row, May 1.—The warm-air ventilating grate shown by Mr. John Grundy at Stand 75 Floral Hall, is an admirable contrivance for utilising the heat conducted through the back and sides of the stove, for warming schools and buildings by a supply of freshly warmed external air."
Apply to JOHN GRUNDY, 30 Duncan Terrace, City Road, London.—Works: TYLDESLEY, near Manchester.
Agent for Scotland, SEPTIMUS HARPUR SMITH, 1 Upper Gilmore Place, Edinburgh.

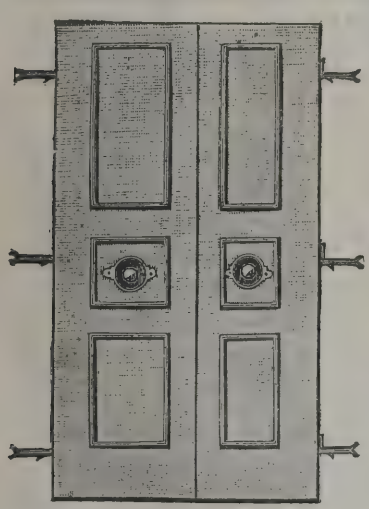
ventilation of St. George's Chapel, Windsor Castle, and the Board Room and Offices of the Metropolitan Board of Works. It is also proposed to adopt Messrs. Boyle's system of ventilation for the new fortifications to be built round Copenhagen.

THE PATENT NOISELESS PLAIN AND INLAID TILE CO., 11 King Henry's Walk, Balls Pond Road, N., have received an order to cover with their patent tiles the aisles of Spa Fields New Church, Lloyd Square, Clerkenwell, and have commenced the work.

MR. HENRY HOPE, of 55 Lionel Street, Birmingham, who, we believe, is the oldest horticultural builder in the kingdom, exhibits, at the Birmingham Exhibition, two metallic lights, specimens of the metallic hot-houses erected in the Royal Gardens, Frogmore and Osborne, one of which has been in wear for over fifty years in a conservatory at Hewell Grange, the seat of Lord Windsor, the roof lights of which form the roofs of two large vineries which are now in use; the construction of these houses is iron and copper. A large range of orchid houses, camellia house, strawberry house, and banana house has been erected last year for Mr. Chas. W. Lea, Parkfield, Worcester. Eminent orchid growers have pronounced these houses to be the best of their class in the market. Several patterns of ornamental coil cases are exhibited, two of them being new ones, and showing great elegance of design. Wrought-iron watertight casements, and others of different sections of iron made for churches, mansions, public buildings, villas, schools, &c., show excellent workmanship, and have a particularly neat appearance.

WE have received a copy of a new pattern-book of encaustic and other tiles, just published by Messrs. T. & R. Boote, of the Waterloo Potteries and Encaustic Tile Works, Burslem, of which we shall give a further notice next week.

A CATALOGUE, the title of which is "An Album of Chimney-pieces," has just reached us from the Builders' Supply Stores, 145 Holborn Bars, W.C., which will be referred to again next week.



ON Monday tenders were considered for the painting of the City Hall, Dublin, and, in accordance with the recommendation of the committee, it was moved to accept the tender of Mr. William Martin at 300*l.* The tender of Mr. F. O'Neill to do the work for 247*l.* was stated, in the opinion of the mover, to be too low for the work to be done properly. Ultimately, an amendment to accept Mr. O'Neill's tender was carried.

THE committee appointed by the River Cart Navigation Trustees, Paisley, on Tuesday had before them the contracts, numbering nineteen, which have been received for the deepening of the river from Paisley to its junction with the Clyde near Renfrew. The borrowing powers of the trustees extend to 80,000*l.*, and the contract prices range from 68,000*l.* to 132,000*l.* No decision has been come to. Messrs. Bell & Millar, of Glasgow, are the engineers.

NOTES ON NOVELTIES.

The Window Blind Company.—We have received from the Window Blind Company, of 4 Lawrence Lane, E.C., a sample book of their inside blinds, and also samples of their Venetian blinds. On looking over the former we notice the artistic designs, of which there are endless varieties, and are surprised that the usual melancholy examples in most houses should be permitted to remain to act as an eyesore to all beholders when a really elegant article can be obtained at the same price, or even cheaper. For the Window Blind Company, being the actual manufacturers, are enabled to sell at cost price, and this they do. They also make a *spécialité* of wire and cane blinds. The sun-blinds made by this firm are worthy of notice. Being mounted on a self-adjusting spring roller, the blind can be raised or lowered by a single cord attached to the centre and fastened at a desired height by one turn of the cord round a cleat fixed on the window-sill. Its action is even more simple than an ordinary spring-roller blind, and when socket-hooks are fitted the blind is easily projected at the bottom, say 15 to 30 inches, to admit of more air or as a protection to flowers. We would advise our readers to apply for samples, as we have seen nothing better—and certainly not at such a low price—before.

An Artistic Tile Chimneypiece.—Messrs. W. Godwin & Son, of Lugwardine Works, Withington, are exhibiting at their London show-rooms, Bridge House, Blackfriars Bridge, E.C., a very attractive novelty in tile work—a combination chimneypiece, interior, hearth, and curb constructed of tiles, so as to form one harmonious and artistic piece of work. So far as we are aware the complete set has never been produced before in tiles, nor would it probably have been found practicable in the present instance but for the employment of the patent process of fixing tiles together adopted by the manufacturers. This method of fixing is used for forming the top

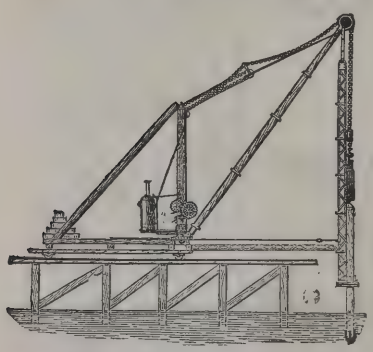
and sides of the chimneypiece and the curb, and consists generally in the use of an iron plate, to which the tiles are secured by means of nuts and bolts, the heads of the bolts dovetailing into a suitable groove running along the centre of the tiles, which are also slabbed in the ordinary manner on cement. The tiles, being highly enamelled, are readily cleaned, and are quite capable of resisting the heat given out by an ordinary fireplace. The tiles also serve admirably to radiate the heat from the fire, and when this is brightly burning in a suitable dog-stove the effect is exceedingly artistic. The interior tiles can of course be removed to make room for an ordinary register stove if preferred, but the *tout ensemble* is then hardly so striking. By this method of construction and combination fireplaces may be composed of any selected tiles. The art tiles forming the chimneypiece are richly enamelled, and of great hardness; do not soil; the enamel does not become dull by dusting, cannot be scratched by ordinary usage, and is warranted by the makers to endure for generations. The hearth and sides have hand-painted 12-inch by 18-inch centres of Christmas roses, which are worked up into panels by highly enamelled tile strips of various colours blending one with the other, and to harmonise with the chimneypiece.



GIRDER BRIDGES.

A PAPER entitled "Some Points for Consideration of English Engineers, with Reference to the Design of Girder Bridges," by Messrs. Shelford and Shield, was read at the meeting of the British Association. The writers affirmed that a general comparison of English, German, and American bridges, with especial reference to the class of work adapted to newly-developed countries, afforded sufficient grounds for the examination of the English practice. This examination was limited in the paper to bridges of moderate span, which, on account of their number, were of greater economic importance. The results of a comparison of typical designs for bridges of 140 feet span were given, and it was stated that the difference between the weight of good designs of the same depth was comparatively small, while the principle that economy was obtained by increasing the depth obtained to an extent which, if recognised in theory by English engineers, had not hitherto found general expression in their practice. This was, however, partly due to external conditions, and it did not appear that there were essential national errors or prejudices in design which were likely to place English engineers at a disadvantage in colonial work. The difference between the position of the designer in America and England was investigated, with the result that, while the advantages of the English system in the interest of security were admitted, it was found to be attended with disadvantages with respect to economy, for which the publication of details of comparative cost of different methods of construction and the adoption of standard sections for rolled iron were suggested as partial remedies. The scientific and commercial interests of engineering called for the abolition of the Board of Trade rules, which determined fixed limits of working stress, unless they could be brought into conformity with modern knowledge of the properties of materials and the laws of construction. The objections to their abolition, although it would open the investigation of the subject to private enterprise, were pointed out, and the construction of new rules was suggested; such rules, while preserving the freedom of the engineer in the choice of design and material, and leaving to him the estimation of all those effects of loading a structure which were capable of determination by known methods, should determine for his guidance by coefficients of safety the provision to be made separately for each of the effects which were usually understood to be covered by an arbitrary factor of safety. It was suggested that the construction of such rules would be more worthy of the professional attainments of English engineers, and would be designed to raise the standard of professional knowledge by avoiding the use of fixed coefficients of which the origin and scope were not known to the user, and to encourage good workmanship and the use of materials of a high class by varying the working stress according to the quality of the materials employed. The revival of the Royal Commission of 1847, to effect for wrought iron and steel what was then done for cast iron, was indicated as the best means of obtaining the necessary data for the construction of rules with these objects.

Mr. W. Anderson opened the discussion by remarking that, in his opinion, English bridge-builders were handicapped by not having any standard form to work to, and he suggested that something of the kind should be provided. It was also important that Her Majesty's inspectors should fix a low limit of stress for girders made of steel.

College) spoke of the difference between pin-joint and rivetted-joint structures. Every one, he said, must at once concede greater facility of construction for pin-joints. If a bridge had to be erected in Germany, France, or England, facility of construction was not of such great importance as when it was to be erected in more out-of-the-way parts of the world, and this must be taken into account in any comparison between the two systems.

Mr. Jeremiah Head thought that the papers were of a useful character. In days like the present, when they were suffering from the badness of the times, there was matter for serious reflection. He had often thought that a great deal more might be done by engineers in availing themselves of the experience which was to be got from contractors in their own workshops. Their greatest constructive experience and mechanical inventions had to a large extent grown up in the workshops throughout the country far more than in Great George Street or any other street in London. This ought to be recognised, and more ought to be done to encourage contractors and manufacturers and others to give engineers the full benefit of their experience and knowledge. The plan of asking contractors to give designs as well as tenders might be carried to the materials of which the things required were made. He did not see why the makers of materials should not be asked to state what tests they would guarantee.

Sir Frederick Bramwell, D.C.L., F.R.S., did not agree with the last speaker that manufacturers should be asked to state what they would supply rather than be asked to conform to specification. The requirements of the engineer being somewhat in excess of the easy production of the manufacturer was one of the best means of insuring improvements in manufactures. He knew what the tests for steel for guns were at the outset, and he knew how they had been greatly varied. The variations had been largely due to certain conditions which the manufacturers had had forced upon them. The French were able to make a steel projectile which had accomplished in England that which no English projectile had accomplished. He could not help thinking that Mr. Head's suggestion, if carried out, would have the result of leaving them very much in a state of stagnation instead of in a state of progress.

Mr. Bayley Marshall suggested that, instead of placing the factor of safety on the limit stress of any material, they should have a factor of safety which depended on the elastic limit of the material. The means of estimating the elastic limit were ow much easier than formerly. It would also be well for engineers to consider the question of the reduction of area at the point of fracture, which was still a vexed question with many manufacturers.

TECHNICAL EDUCATION.

THE subject of technical education was brought before the meeting of the economic section of the British Association.

Sir Philip Magnus read a paper on "Manual Training," a subject which, he said, had been carefully considered by a committee appointed to continue inquiries relating to the teaching of science in elementary schools. They had reported to the Council of the Association that it was desirable to make representations to the Education Department, and suggested that the encouragement for the teaching of handicraft work might take the form recommended by the Commission on Technical Instruction, so that the use of tools in boys' schools might be placed in the same position as practical cookery in girls' schools. It could not be too often repeated that the object of workshop practice, as a part of general education, was not to teach a boy a trade, but to develop his faculties, and give him manual skill, and to familiarise the pupil with the properties of such common substances as wood and iron, to teach the hand and eye to work in unison, to accustom the pupil to exact measurement, and to enable him by the use of tools to produce actual things from drawings that represented them. Sir Philip pointed out the collateral instruction that could be given in connection with the teaching of handicrafts, and showed that while the faculties of the children were being usefully exercised, and the area of their knowledge was being extended, they were at the same time acquiring manual skill which could not fail to be useful to them in every trade. Experiments of introducing workshops in elementary schools had been tried in this country, with results sufficiently encouraging to justify the extension of the system; and on the Continent and in the United States much was done in technical teaching. An enthusiasm was spread among Americans in favour of workshop instruction, which was likely to have an important influence on the industrial progress of that eminently practical and inventive people. As a general rule, Sir Philip Magnus suggested that children should be required to have passed the fifth standard before being admitted into the workshop. He estimated that not more than 30,000 boys would be ready to receive workshop

instruction in this country, and the additional Government grants might be 5,000*l.* For this comparatively small expenditure about 30,000 boys might be annually sent out into the world from elementary schools with practical skill at their finger ends, and imbued with an aptitude and taste for the real work of their life. The importance of practical teaching, of studying things before words, had been many times urged, but as yet, such had been the inertia of school authorities and teachers, and such the force of tradition, that we were only now beginning to employ the methods of instruction that had been reached for years by the most eminent educational reformers. It was hoped that the committee of the Association would persevere in the representations it had already made on this important subject, and that the labours of the Royal Commission might result in making our elementary school teaching more practical, less verbal, and less mechanical. They asked that in any new code it might be provided—(1) that the subject be duly recognised, so that no part of the attendance grant be lost in consequence of the time devoted to it; (2) that School Boards be empowered to erect and equip workshops in or near elementary schools for the instruction of children who had passed the fifth or qualifying standard; (3) that the grants be paid by the Government on the number of children receiving instruction and making the required number of attendances.

Mr. W. Ripper read a paper on "Technical Instruction in Elementary Schools." Experimental science was almost unknown in our schools, and, as a consequence, the children went out into the workshops and factories crammed with information about moods and tenses, but absolutely ignorant of the elementary principles which would enable them to reason intelligently upon the physical facts and phenomena by which they would be continually surrounded. Systematic science instruction was being given in the Board schools of Birmingham and Liverpool, and with excellent results. The children were interested in their school-work; they acquired information which no amount of mere book-reading would give them, and the advantage of such instruction would be reaped not by the children alone, but by the whole community. The idea in the minds of many people had been that education was going to save their children from hard work, and the present system of instruction was still in danger of encouraging this notion, and of creating habits and tastes which may unfit the mind for the work before it, instead of fitting and aiding it. There could be no greater fallacy than to imagine that any boy was too good for the workshop. The workshop urgently needed these very boys, and if the public elementary school was not helping to enlist its best talent on the side of skilled labour we were not on the right course. A more practical system of instruction was destined to grow and to occupy an important place in our educational methods of the future, the aim of which would be, while sacrificing none of the present advantages, to enable the schools to render more efficient help than in the past to the nation's industrial progress.

The Rev. H. Solly read a paper on "Technical Education," in which he urged that the apprenticeship system, having for the most part broken down, the practical training of the workshop must be supplemented by the combined practical and scientific teaching which can be given only in the classroom. Systematic and scientific instruction in the principles which underlie all manual industries, and the application of those principles to the material of each handicraft, is essential for thorough technical training, and can be given only by class teaching, not in the workshop. At present it is apparently no one's interest, nor legally any one's duty, and certainly no one is in general qualified to give this instruction to apprentices or youths; while it too often appears to be the employer's interest to keep the lads in particular grooves of work from which they learn nothing but very limited routine dexterity. Other nations have long since acted on a wiser system, and we are feeling the consequences. The remedy is to secure systematic and thorough technical training for the rising generation of artificers, by returning to a regular system of "indentured apprenticeships," whereby the employers, if they take lads at all into their workshops, shall be bound to see that they attend technical training classes for a certain number of hours in the week during the first three years of their apprenticeship. The increased value of the services of the apprentice during the remainder of his term, and in some cases money premiums, should recoup the employer.

A paper on the "Economic Value of Art in Manufactures,' by Mr. Edward R. Taylor, was read for him in his absence The author said that the lack of beauty in many English manufactures arose not so much from bad taste on the part of the purchaser as from the producer's want of artistic culture. In that case supply must precede demand. Manufacturers too often ignorantly regarded art as an adjunct, instead of an essential, to their wares. Art, on the contrary, should be studied with as much daily care as the other branches of the manufactory. Facts were adduced to show that it is only when such care had been devoted that the work would live and be

And so on to any amount.

In the transaction of speculative business Messrs. C., S. & Co. make no charge for commission or brokerage whatever unless their client makes a profit, when they take 5 per cent. of the profit made as their remuneration.

All transactions advised by wire as soon as completed. Monthly Circulars and Mining Reports post-free on application.

COLES, STEWART & CO., St. Stephen's Chambers, LONDON, E.C.

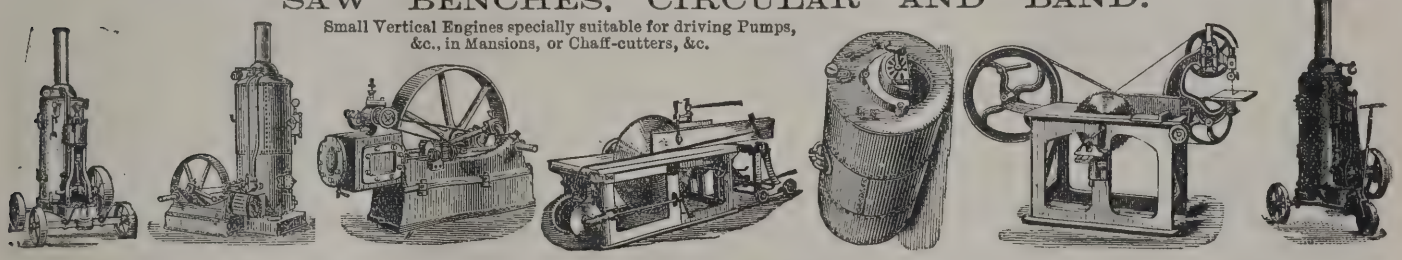
most pecuniarily profitable; and the attention which in former times was given in this direction was contrasted with the comparatively small amount of thought now, in several instances, devoted thereto. Artistic manufactures might be advanced—(1) by the encouragement of all hand-manufactures and decoration; (2) by counteracting the apparently natural tendency of machinery and other inventions to vulgarise art by the inordinate use of ornament of a poor character; and (3) by making the training of the eye and (by the use of tools) of the hand an essential part of education from the beginning of school-life.

A discussion followed, in which Mr. Fellows, Mr. G. Hurst, Mr. W. Bobley, Mr. Spratling, and Dr. Gladstone took part, and objection was expressed by some speakers to any increased grant for purposes of technical education.

Sir P. Magnus, in replying, said, having regard to the system of elementary education they had adopted, unless the Government took up the subject of manual training, it was not likely to be dealt with. He had desired to point out in his paper at how small a cost this could be done.

CONVICT PRISON, PETERHEAD.

THE Prison Commissioners of Scotland are about to erect a large prison at Peterhead. The convict prison proper is to consist of four wings, each to contain 170 cells of the regulation accommodation—or, in all, 680 cells, with the necessary accesses, &c.; but connected with the main building are lavatories, bath-rooms, and such other accessories to a large prison as are required. In proximity to the prison extensive "quarters" have to be provided for the large staff of warders and other prison officials, while within a short distance from the same place a house for the governor has to be erected. In addition to these are the infirmary and hospital, board-room, &c., the whole buildings pretty well filling up the vacant space of ground acquired by the commissioners to the north of the harbour of refuge works. The whole of the buildings are to be of stone and lime, and will be lighted with gas. The responsibility of the whole contract is to be undivided, the successful contractor having charge of the mason work, carpenter work, plumber work, &c., and he is bound under heavy penalties (100*l.* per day over-reached) to have the whole ready for occupation by a given date. The time allowed for carrying out and completing the work is thirteen months, and work has to commence immediately on the acceptance of the contract. The prison will be occupied by the beginning of 1888.



TERRA-COTTA *v.* STONE.

A MEETING of the Birmingham Trades Council was held at the Public Offices on Saturday night, when Mr. J. Riddler (stonemason) introduced a discussion on the use of terra-cotta in preference to stone in such buildings as the assize courts, and contended that stone was more useful in almost every respect when properly chosen. He said that stone was superior to terra-cotta, and would resist the atmosphere of the town. He admitted that some stone had proved a failure, but such stone as Hollington, Darley Dale, Bath, and Portland had been employed, and had given every satisfaction that could be desired. As an instance of the durability of the stones he had mentioned he pointed to the Inland Revenue offices, which, he said, were built of Hollington stone, and were in perfect condition. The Bluecoat School, which was of Attlebury stone, not well laid, had chipped; but the cornice, which was of Hollington, well placed, was still in perfect condition. The Midland Bank was a perfect specimen of Portland, and the former gas offices in the Old Square were without either chip or blemish, excepting where some iron railings had been placed against them. The General Post Office, although not a work of art, was an instance of the durability of Bath stone in the Birmingham atmosphere. The buildings might look dirty, but he (the speaker) suggested that in the case of public buildings the fire brigade might occasionally be employed in cleaning them, a practice which would avert any injurious effect being produced by acids. The Birmingham air was not nearly so bad as the air of Manchester, where the chief public buildings were of stone, and in good condition. He contended that the deleterious effects of the atmosphere would more readily operate on terra-cotta. There had been considerable talk about the Roman terra-cotta; but that had been buried for hundred of years, and had not been in contact with the atmosphere.

Mr. Farr (stonemason) objected to the use of terra-cotta in the erection of public buildings, as it would take money in wages out of the town, which the artisans had a right to expect.

A discussion followed, in the course of which the President

KALLKOLITH. TO ARCHITECTS, CONTRACTORS, & BUILDERS.
SAVE ONE-THIRD of COST and TIME in your PRIMINGS by using KALLKOLITH
IT produces an exquisite smoothness, and amalgamates thoroughly with WOOD, STONE, IRON, CEMENT, PLASTERING, &c. IT is less than HALF the WEIGHT, and IT goes further than three times the same quantity of ordinary priming. IT has to be thinned with two parts of water for use on Stone, Cement, and Plastering, and with seven parts of water for preparing Walls for Colouring and Paper Hanging. IT dries in from ONE to TWO hours, effecting a great SAVING in TIME. IT lasts longer and better than any other priming known, and prevents Blistering. Price per Case of Eight Tins of 14 lbs. each, 40*s.*, packing included. Sample Tins, 6*s.* each.

STEAM WATER HEATER.

IMPROVED
STEAM WATER HEATERS
FOR HOTELS, RESTAURANTS, COFFEE TAVERNS, FACTORIES, STEAM LAUNDRIES, HOSPITALS, &c., &c.
Maker of Copper Bath and Circulating Boilers, Cylinders, Tanks, Furnaces, and every description of Copper Work.
These Heaters are made of sheet copper, planished and neatly finished, the inside of each vessel and the copper coil being well-tinned, fitted with hinged cover and lute ring to prevent escape of steam from the boiling water. The standard sizes of vessels Nos. 1, 2, and 3 hold 12 gallons, and are supplied with 1¼-inch brass cock, with lever handle. Price List on application. Estimates given for every description of copper work.

HOLDSWORTH'S IMPROVED BATH BOILER.

regretted that if the stonemasons were so positive about the durability of stone, which he admitted was capable of accepting more beautiful designs than terra-cotta, they had not raised the question before. Terra-cotta had been growing in use for nearly ten years.

Ultimately, on the motion of Mr. Stevens, seconded by Mr. Davis, the following resolution was passed:—"That the Trades Council thank Mr. Riddler for introducing the question of stone *v.* terra-cotta, and seeing that stone could be proved of lasting quality and beauty far greater than terra-cotta, this Council trusts that the public and the authorities will study the question before deciding what material they will use in the erection of buildings, and especially public buildings."

THE CONTRACT FOR JOINERS' WORK AT THE GLASGOW MUNICIPAL BUILDINGS.

AT the meeting of the Glasgow Town Council on the 2nd inst., the New Municipal Buildings Committee reported that they had now made up a list of eleven contractors who should be asked to tender for the joiners' work of the New Municipal Buildings, and that the contractor whose contract was accepted should find security to the extent of 5,000*l.* for the due performance of the contract, and that 10 per cent. would be retained from payments by measurement till such retained sum amounted to 5,000*l.*

Bailie Shaw complained that the names selected were not before the Council.

Bailie Gray asked what amount would be involved in the contract?—Mr. Laing replied that it would be about 80,000*l.*

Bailie Shearer asked whether, in the exercise of their powers, the committee would give the contract to the lowest offerer?—Mr. Laing remarked that in all probability the lowest offerer would get the job, but it was specially reserved that the lowest offer might not be accepted.

Bailie Shearer moved that contractors for the joiners' work should be advertised for in the usual manner.—Mr. D. Macpherson seconded this amendment, as he considered that this course, which was followed in the case of the masons' work, should also be followed in that of the joiners' work.

Dr. Marwick, the town clerk, read the previous minutes, under which the committee had made the selection, and which had been approved of by the Town Council on May 3. He believed that, following out their action, it was absolutely necessary for the committee to take the lowest offer; but while he held that opinion, he thought it was perfectly right and prudent to keep the matter in their hands so far, that in the event of any doubt or anything arising they should not bind themselves to accept the lowest offer.

Mr. Laing said there was no doubt, from all the information that was before them, the lowest offerer for the job would get the contract, unless something transpired of which they at present knew nothing.

Dr. Marwick said that the proper method to prevent the committee carrying out their instructions would be to move that the remit to them be rescinded; but if they did such a thing it would be the first time in all his municipal experience that such a course had been followed, and the committee could look at it as little else than a vote of no confidence.

Mr. D. Macpherson said this was another instance of unwarily giving a committee powers. That must be guarded against in future.

Bailie Shaw moved that this part of the minute be delayed.

Dr. Marwick stated that this could not be done.

As both amendments were ruled incompetent, the minutes were approved.

ROOFING SLATE FOR INDIA.

THE efforts which are being made to wrest trade from English producers may be judged from the following by Mr. A. Studder, the United States consul at Singapore, which we find in the *American Architect*:—

I am informed that the manufacturers of black roofing slate in the United States are desirous to obtain information respecting the uses of that article in India; that the slate area in the State of Pennsylvania was almost inexhaustible, and as rapidly developed as the demand increased; that the manufacturers were desirous of extending their exportations to India; that large quantities had been shipped to Australia and other distant countries.

Last year I answered Messrs. Boyle & Co., slate exporting financiers, of Philadelphia, anxious to extend their trade hereabouts, after recommending to them the appointment of an agency, to send to the same a trial consignment (which holds good to-day) as follows:—

"Thus far little slate for roofing has been used, tiles being generally used throughout India; and for cheap, light buildings (bungalows), the leaf of the attap palm (thatch). It would be best to forward and consign a sufficient quantity for trial and introduction. I feel morally certain that without doing this you will not get orders. What slate has been used here for roofing (on Government buildings chiefly), was imported from England, and you are better able to judge as to whether you can compete with that country. The cost of freight on a sailing vessel would be about the same from Philadelphia as from an English port, I think."

Being directed to report upon all India, I must confess that, while I am pretty well informed about that vast country and islands belonging thereto (British and Dutch), I have never yet been in Upper India; but there are many here who have been there, and they tell me that for roofing houses about the same materials are used as in this colony, as follows:—

Manner of Roofing.

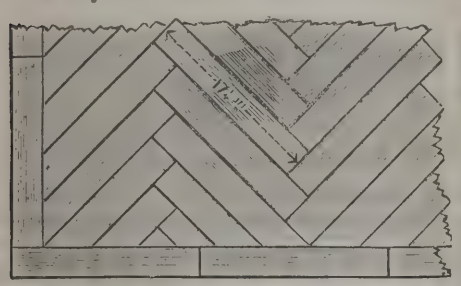
1. For all substantial buildings (governmental, mercantile, and residential) the half-round tile, made of brick clay and baked, is used. These are easily laid—joining in and out, under and over, and overlapping each other—and makes an excellent, durable, as well as cool roof in a tropical country, as they furnish air currents throughout. In a cold climate, unless covered with mortar or cement where they lap and join, they would not answer. A tile roof is, of course, very heavy; but, as there is an abundance of very hard wood out of which to make timbers and frames able to bear it, it does not matter. Coolie labour is very cheap (ranging for all India from eight to twenty cents per day), clay and fuel abundant, and as a rule very near each other, and therefore tiles can be had cheap.

2. For plantation and cheap European residences, bungalows, and the dwellings of the native population in suburban and country districts and on farms—all having, as a rule, far-projecting roofs—the leaves of the attap palm, the kadjang (a species of huge grass growing on low, marshy river-bottoms, shallow lakes, and lagoons in vast fields, as I have seen in the swamps of Kassang River, near Malacca),* and sundry other tough broad grasses and fibres suitable for thatching, are used and give general satisfaction, being very abundant, cheap, and answering their purpose well. A well-made attap or kadjang roof will last from three to four years, when it becomes brittle, and, as a consequence, leaky, and must be removed.

3. For the roofs of coal sheds, wharves, warehouses, landings, bazaars and markets, verandas, and other airy, light shed-like structures, having no walls and only posts or brick pillars for support, corrugated sheet-iron or fluted zinc sheets, this, with steadily increasing tendency is used. This kind of roofing was first introduced here about twelve years ago.

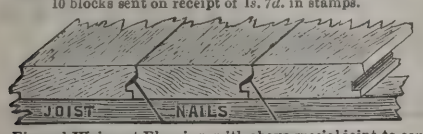
No Present Market for Slate.

As to black slate for roofing, it has been used, to my knowledge, on two new Government buildings having mansard roofs within the last two years, *i.e.*, police headquarters and post-office, one mercantile building, and two churches. This slate, as none has ever been kept for sale here, was imported from Wales, where, there being large quarries of it, I am told it is very cheap.



Firms in the United States engaged in the manufacture and export of slate can easily find out whether they can successfully compete with English quarries in Eastern markets, the cost of freight being about the same from our Atlantic as from ports in England (on sailing vessels, I mean).

Summed up, upon careful consideration and reflection (referring more to my consular district than all India), I hardly think that the sale of slate for roofing, from any country, will ever amount to much in the tropical part of Asia. But as some will be used, perhaps more and more as civilisation, with a higher taste for architecture advances, it would, I think, be well for our American slate exporters to create agencies in the principal ports of India, and to forward to them trial consignments (not too small) of their productions. I know of no better way, if they can only compete with English or European exporters. It must be borne in mind at the same time that Calcutta, and perhaps Bombay excepted, we have no American firms in British or Netherlands India, and must rely on foreign merchants for the sale of any kind of American merchandise.



I would recommend the creation of agencies at the following ports:—Calcutta, Rangoon, Madras, Bombay, Colombo (Ceylon), Singapore, and Penang, Bangkok (Siam); Batavia, Sourabaya, and Samarang, in Java, and Manilla (Philippine Islands).

* I have read in some naturalist's books that the kadjang is a palm leaf, which is absolutely not the case. It grows about as tall as an average corn stalk out of water; its leaves resemble, in shape and length and breadth, a corn leaf, but have a sawlike jagged edge. The stem of the kadjang is about as thick as a corn stalk, and as readily cut.

LONDON BOARD SCHOOL
FLOORING BLOCKS.
The only Prize Medal at Health Exhibition.

Out of 17½ in. by 3 in. by 3 in. best Yellow Deal, planed all round. At 11s. 6d. per 100, delivered to van at our wharf. Much lower price delivered ex "ship" within one month. Sample of 10 blocks sent on receipt of 1s. 7d. in stamps.

J. W. CALDICOTT,
MANUFACTURER OF INDIA
RUBBER STAMPS,
WALSALL.

"THE PEDESTAL VASE,"

JENNINGS' IMPROVED W.C. APPARATUS

(Combination Urinal and Slop Sink).

Registered No. 16,300.

A PORCELAIN VASE set on a tiled or mosaic floor, within walls or a dado of glazed tiles. The usual wood framing, forming a storehouse for the retention and accumulation of *damp*, *dirt*, and *disease germs*, with the joints, crevices, and imperfections in work which the closet enclosure so often conceals, is entirely abolished. The seat is hinged, permitting free access for use as a *slop sink* or *urinal*, and for cleansing, so that the entire apparatus and space can be freely washed down. For this latter purpose the floor should be slightly sunk, and laid to fall to a grating, with waste carried through the external wall, and terminating in a copper flap valve to prevent draught.

☞ The suggestions as regards wall linings and floor, may, of course, be modified as best adapted to the building in which the closets are used; and in the consideration of such details, alternative schemes will readily present themselves.

At the recent **HEALTH EXHIBITION** (South Kensington, 1884), amongst a series of official tests, under the supervision of Baldwin Latham, Esq., C.E., and the Jury No. 9, Class XXIII., and successfully withstood by this closet, the following may be cited in evidence of its efficient action. Being fixed in position shown in illustration, with **"JENNINGS' PATENT SINGLE FLUSH WASTE-PREVENTING SYPHON CISTERN"** 5 feet over, with 1½ inch down pipe, ten apples (averaging 1¼ inch diameter) and a flat sponge about 4½ inch diameter were thrown into the basin. The water, as well as the whole of the exposed or dry surface, was first blackened with plumber's "smudge," and the sides covered by four pieces of thin sanitary paper, which adhered closely to the soiled surface. The handle of the cistern was then pulled, and the two-gallon flush liberated. After seven seconds (the time occupied by the discharge), a receiver placed under the trap outlet was removed, containing in the blackened water **the ten apples, the sponge, and the four pieces of paper,** no traces of the soil remaining visible upon any part of the apparatus.

GOLD MEDAL AWARDED.

THESE CLOSETS are already in use in Hospitals, Banks, Hotels, Offices, Private Residences, &c., with most satisfactory results, and, fixed in the manner described, in appearance and action leave nothing to be desired. By the novel arrangement of the supply to Basin, as shown in the sectional sketch annexed, the whole surface is well flushed and cleansed, whilst the bottom of Basin and Trap are thoroughly scoured by a concentrated rush of water which insures the **instantaneous removal** of the contents, thus overcoming the inherent defects in the many imitations recently produced of **"JENNINGS' MONKEY-CLOSET"** (the **original form of wash-out watercloset**), which was invented and patented by G. J. in 1852.

BURY.—Sept. 21.—For Supply of 15-inch Cast-iron Pipes (7,000 yards). Mr. J. Cartwright, Borough Engineer, Bury.

CANTON.—Sept. 20.—For Building Board Schools for 1,119 Children. Mr. E. M. Bruce Vaughan, Architect, Borough Chambers, St. Mary Street, Cardiff.

CLONTARF.—Sept. 27.—For Constructing Series of Main Sewers, Fairview District. Mr. W. Stirling, Surveyor, 107 Stephen's Green, Dublin.

COCKERMOUTH.—Sept. 18.—For Building Shop and Warehouse, Station Street. Mr. R. S. Marsh, Surveyor to the Local Board, Cockermouth.

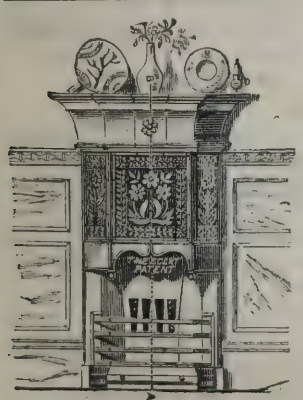
DEWSBURY.—Sept. 22.—For Building Mortuary, Laundry and Wash-house in Connection with the Infirmary. Messrs. J. Kirk & Sons, Architects, Dewsbury.

DUBLIN.—Sept. 22.—For Iron Railing, Fence, Gates, &c., for Recreation Grounds, Cabra Workhouse, North Dublin Union. Mr. W. H. Byrne, Architect, 20 Suffolk Street, Dublin.

DUMFRIES.—Sept. 18.—For Building Post Office. Mr. H. W. Primrose, Secretary, H.M. Office of Works, Parliament Square, Edinburgh.

EDINBURGH.—Sept. 20.—For Building East and West Wings, Heriot Watt College. Mr. J. Chesser, Heriot Works Office, 21 St. Andrew Square, Edinburgh.

FORRES.—Sept. 18.—For Rebuilding Farm Steading, Buchtiby. Mr. John Milne, Architect, Elgin and Forres.



GORTON.—For Constructing Heating and Dipping Chambers, with Brick Seating and Chimney. Mr. T. H. G. Berrey, Waterworks Office, Town Hall, Manchester.

GRANSHAW.—For Enlarging and Repairing Manse, &c., at Granshaw Church. Mr. Chapels, Architect, Newtownards, Belfast.

GREAT YARMOUTH.—Sept. 30.—For Building Three Houses, Bath Hill. Mr. W. B. Cockrill, Architect, Glencoe House, Gorleston.

GUILDFORD.—Sept. 20.—For Constructing Roof Over Reservoir, Pewley Hill, Supply of Cast-iron Pipes (4,900 yards), and Two Tons of Lead. The Water Manager, South Street, Guildford.

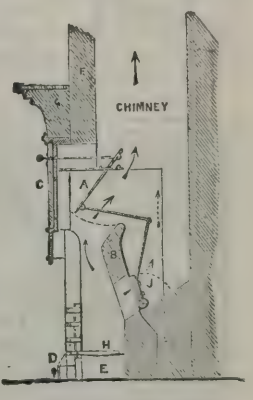
HALIFAX.—Sept. 23.—For Works of Reinstatement, &c., at Flour Society's Mill. Messrs. Horsfall & Williams, Architects, 15 George Street, Halifax.

THE "ECLAT" AND THE RUMFORD-TEALE FIRE-GRATE.

"As little ironwork as possible."—Vide *"Economy of Fuel," by T. Pridgen Teale.*

These fireplaces are wholly constructed of Fire-clay and Glazed Terra-cotta or Faience Ware on principles introduced by the celebrated Count Rumford, and recently revived by Dr. T. Pridgen Teale, with the addition, in the form of the "Eclat," of a Front and Range projecting in advance of the Chimney-Breast, as recommended by Sir Wm. Armstrong.

A Pint only of Residuum in the form of Fine Ash obtained from the combustion of 22 lbs. of Coal.



WILL BURN ANTHRACITE OR COKE.

Illustrated Circulars from the Makers, together with Catalogues descriptive of their—

Patent Chain Fan and Hopper Light Opener.
" Perfect Fanlight Regulator.
" Chain Skylight Lifters and Iron Skylights.
" Reversible Pivoted Windows for Cleaning from the Inside.
" Epicycloidal Action for Opening one or a number of Lights simultaneously.

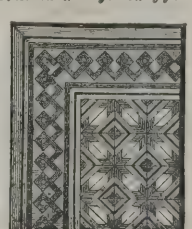
LEGGOTT'S PATENT ADJUSTMENT,
FOR FANLIGHTS, SKYLIGHTS, &c.,
Is admitted to be the best ever put before the Public.
From 5s. each.
Write for REDUCED PRICE LIST and Testimonials to
W. & R. LEGGOTT,
70 Park Road, Bradford, Yorkshire.
N.B.—Size and height of window no object.



TESTIMONIAL.
BANGOR, N. Wales: September 14, 1885.
Sirs,—I have pleasure in testifying that I have used Leggott's Silent Adjustments for various buildings to high skylights, fanlights, and top parts of windows, and in every case they gave satisfaction. They are secure in whatever position, whether the window is open or closed, and are quite simple and workable in their action. I prefer them to any other that I have seen or used for the above-mentioned purposes.—I remain, yours obediently, R. DAVIES, Architect.
Messrs. W. & R. LEGGOTT, Bradford.

TRADE NOTES.

MESSRS. E. & H. LUMLEY, on Wednesday the 8th inst., held their eighth sale by auction of plots of land at the new seaside watering-place, Lee-on-the-Solent, Hampshire, adding another to their list of successful sales. In this case forty-one lots out of forty-five were sold, at prices averaging 50*l.* per plot, or about 500*l.* per acre.

A USEFUL album of chimneypieces has been printed for the Builders' Supply Stores, of 145 Holborn Bars. The bulk of the pages is, as may be supposed, devoted to the illustration of chimneypieces in various designs of much excellence. There are thirty-six designs that show ornamental chimney-pieces in styles suitable to the present times, and they range in elaboration to a high scale of ornamental excellence. Amongst household fittings the chimneypiece affords a special scope for the exercise of architectural design. Such materials as marble, slate, &c., have their own inherent beauty, which is independent of design, and this of itself is an inducement to apply designs only that are worthy of the material. In the album will be found a valuable series of, in the main, entirely independent designs, and designs not merely varying by the substitution of different details. Judging from the designs, the executed work will prove meritorious in a high degree, and the most fastidious will find something to suit them. The designs include Gothic and various types of Renaissance; most of them are severely treated, without any of the meretriciousness found in works of the class.

WHITE WOODWORK OF DOMESTIC INTERIORS.

FROM time to time many must have felt grievously pained on seeing the beautiful variety of grain possessed by the white woods, which enter so largely into the construction of our domestic interiors, ruthlessly covered over by paint. Nature is, and ever will be, superior to art, and we know of no greater act of vandalism than that of covering over a beautiful piece of well-seasoned, richly-grained pine or deal with a non-transparent colouring matter, which is, when so utilised, as great an offence to true artistic taste and feeling as it is expensive and wasteful. So long, however, as house-builders see it to their apparent advantage to build cheaply-constructed houses, so long will the extensive use of paint, putty, and knotting be the covering and concealing agents they now are.

It is no secret that paints, &c., are the cloaks under which

SECTION.

PLAN.

the unscrupulous builder seeks to hide away inferior wood and workmanship, but the Nemesis of time will sooner or later disclose in all its glaring enormity these manifold imperfections, often, alas! too late for the innocent house proprietor who, having paid his bill, finds out, to his great mortification and cost, that, however artistically his house may have been embellished by the aid of paints, &c., yet the underlying green or sappy wood so covered, although for the time being hid away from the eye, sooner or later begins to painfully manifest itself even to the most obtuse of observers. Very great credit is, therefore, due to Sir William Vincent and his architect, Mr. J. T. Walford, for having had the courage to totally abolish the use of paint on the white woods throughout the beautiful mansion he has recently had erected at Comfort Field, Ashted. This elegantly-designed dwelling, situated in the centre of one of the most beautiful home counties, commanding the most extensive and picturesque views, has had its interior woodwork so treated as to be in every way in harmony with its rural surroundings without the aid of paint.

It is well known that the bare pine and deal, notwithstanding the variety of their undeveloped grain, cannot, in their natural state, be made to harmonise with the furniture and other surroundings. It therefore becomes necessary to give to them some tone or colour, which, while it does not conceal the natural grain, yet shall be in harmony with the furniture and other fittings of the rooms, and the best method by which this can be accomplished is to give to these white woods the rich tones and tints of the higher and better class ones usually employed where the question of cost is not a consideration. This desirable result can only be done successfully by the employment of a genuine reliable chemical dye. The decorations of the white wood, throughout the whole of the above-mentioned dwelling, have been artistically executed by a simple process, by means of which various designs of fruit, flowers, and objects of still life, heads, masks, birds, and other animals have been successfully and beautifully rendered in stain.

Stains have for many years been extensively employed as a plain covering for large surfaces of the white woods employed in ecclesiastical and other large buildings, and to a small extent in the domestic interior for the borders of rooms, but have not hitherto been employed for the complete artistic decoration of our domestic dwellings, either internally or externally. The Worshipful Painters and Stainers' Company have done much for the advancement of decoration by means of paint and colours, yet have to all intents and purposes altogether neglected the use of stain as a decorative agent; but as a covering for wood the latter is by far the most natural, and now that it can be used as freely as distemper for stencilling or pencilling, there is no reason why its use should not become more general. It is a well-known fact that staining is in every way far more durable than paint. The effect of age on genuine stain is simply to deepen the tone, and to give a similar richness to that acquired by time by the higher-class woods they seek to imitate. This is true of Stephens's stain, and it is this particular stain which has been used on the decoration of Sir W. Vincent's mansion above referred to, the decorator being Mr. P. Malcolm, 33 Southwick Street, Cambridge Terrace, Hyde Park.

BUILDING AND PAVING IN NOTTINGHAM.

THE General Works and Highways Committee of the Nottingham Town Council report that although there is a decrease in the number of new buildings erected and in the number of new streets now being laid out, the staff of the committee is fully engaged in overtaking the arrears of work which accumulated during the last few years when such enormous strides were made in the building operations and in the general development of the town. The following is a return of plans passed for buildings to be erected in the borough during the last eight years :—

1879	Number of buildings	2,856
1880	Ditto	2,399
1881	Ditto to October 31	2,987
1882	Ditto ,, ...	3,350
1882	Ditto November 1 to March 25, 1883 . .	1,465
1883	Ditto March 26 to March 25, 1884 . .	3,199
1885	Ditto March 26 to March 25, 1885 . .	2,187
1886	Ditto March 26 to March 25, 1886 . .	1,870

The figures below give the total of the various descriptions of materials used either in new works or repairs, on the public footpaths throughout the whole of the borough, which includes Lenton, Radford, Basford, Bulwell, Sneinton, and Nottingham: —Superficial yards of flagging, 2,246; lineal yards of new kerbing, 6,651; superficial yards of asphalte, 25,298; cement concrete in footpaths, 8,081. In the public carriage-ways, 1,937 super. yards of old sorrel stones have been pulled up, the ground excavated, and concrete bottom laid, on which were paved creosoted wood blocks; 15,802 superficial yards of new sorrel paving have been laid, and 13,263 superficial yards of old

paving have been pulled up, the old stone sorted and again repaved partly with old, and the remainder with new granite setts or randoms. No less than 9,100 tons of granite ringsmall and broken cinders have been used for general repairs to macadam roads in the whole of the borough. Of this quantity 4,523 tons were used in Nottingham, the remaining portion being sent to the outlying districts. Independently of new streets, &c., done under notice, various other works of flagging, kerbing, paving, and drain connections, &c., have been carried out at the request of no less than 900 owners and others who have signed undertakings to pay for works when done. The wages paid through the weekly wages sheets to men employed by the Works and Ways Committee on private improvement works, amount to 15,017*l.* The total amount of accounts rendered to owners and others during the twelve months is 53,000*l.*

ORNAMENTAL TILES.

MESSRS. T. & R. BOOTE, of the Waterloo Potteries and Encaustic Tile Works, Burslem, have just issued a new pattern of encaustic and other tiles. The book is admirably got up, and the coloured illustrations so beautifully and faithfully rendered, that the effect on any particular design as it would appear *in situ* is realised at a glance. The book in itself is a good specimen of art workmanship, and, even in the letterpress, the familiar printer's ink has given place to colour, for black is only seen as far as it enters into the illustrated designs. Besides its utility to architects, builders, &c., for purposes of reference, it is a most presentable record of the work of the present day. Nearly 150 patterns are illustrated, and, in the great majority of cases, a large amount of space is given to each. Forty-five plates are devoted to tiles for floors, and these comprise over 180 designs, the first beginning with No. 391, all of great excellence, and drawn to a scale of ¾-inch to the foot. It would be difficult among so much excellent work to pick out any design for special commendation, and the flooring, when laid, would be satisfactory whatever design might be selected. The particular purposes of the building, &c., naturally determine certain broad lines or divisions within which the choice must be made—for instance, plainness and simplicity are required, or again, soberness and dignity, or something very rich and sumptuous, or what is sought for is something light and delicate, bright, tasty, &c.

While the circumstances decide the broad lines within which the choice is to be made, ample room for selection is offered within those lines, and it does not seem possible to adopt a pattern the effect of which would not be most satisfactory. The patterns, both in design and in colour, are wonderfully good. The designs often show a multiplicity of tints, but combined with great judgment—we might refer to plate 10 as an instance of this—and there is an entire absence of anything *outré* or *bizarre*. In fact, Messrs. Boote have compiled one of the best series of designs that we have seen in this class of work. Among the flooring material, we find on plate 46 several designs in Roman mosaic pavement, and they are indicative of what pleasing work can be designed in this style. No. 576 is a case in point. Other plates are devoted to wall enrichments, as dados and wall tiling, and these range upwards to a high scale of elaborate richness; the others are reserved for fireplace decorations, hearths, jambs, &c., in rich glazes, geometric and other patterns; also with floral and pictorial treatment.

It would be hard for any one, even with unlimited space at command, to do more than indicate some out of the almost unlimited combinations of design that tile work can receive, and it is only truth to say that notwithstanding the variety of patterns, it was impossible to represent the whole of the forms in which tile paving may be laid. Special designs, however, can be prepared in any case, and this for practical purposes is all that is necessary. As all the patterns are numbered, it is only necessary for the customer to quote the number. Any single sheet can be had on application, and thus there is every inducement to preserve the pattern-book itself unmutilated.

THE VALUATION OF THE EDINBURGH EXHIBITION.

THE appeal presented by the agents against the valuation of the Edinburgh Exhibition buildings at 17,797*l.* for taxation was heard before the Burgh Valuation Appeal Court on Friday last.

Mr. Young, Advocate, appeared for the appellants. The appellants, he said, believed that the present buildings put up on their present site to remain there for six months, or according to agreement with the Town Council till October 31, ought not to be treated as subjects which could be truly said to have a yearly value. They were further satisfied that the buildings, if they should fall to be valued as permanent buildings, had been greatly overvalued. In regard to the latter point, it must be perfectly evident that the Assessor in assigning such a high

L'ART,

A COSMOPOLITAN ILLUSTRATED JOURNAL,

CONTAINING TWO VERY FINE ENGRAVINGS IN EACH NUMBER,

Will be published simultaneously in LONDON and PARIS on the 1st and 15th of each month, and will contain articles by the best French writers on Architecture, Painting, Sculpture, Art Galleries, Exhibitions, Dramatic Art, Museums, &c., &c. Reviews will also be given of all new books published on these subjects.

MESSRS. GILBERT WOOD & CO.,

OF 175 STRAND,

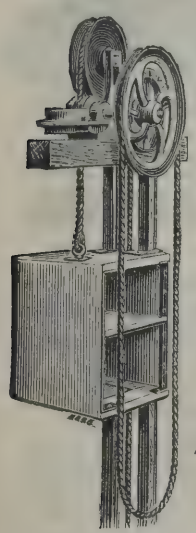
Being the Sole Publishers for Great Britain, all Communications should be addressed to them concerning Subscriptions, Advertisements, and Copies of Etchings, Engravings, and Medallions in Bronze, &c., &c., of the French Library of Art.

rental to these particular buildings must have entirely left out of sight the very exceptional circumstances in which they had been raised. The main question was whether these buildings ought to find a place in the valuation roll as subjects to which an annual valuation could be said to attach. It was plain that the statute was never intended to apply to mere temporary erections having an adventitious and flitting value, and liable to removal before the half-year of valuation had run its course. The roll was made up annually, and section 1 of the Act expressed that it was intended to show yearly value. Under section 12 it was provided that it should be in force for a year, so that when the Assessor made the entry referring to the exhibition he represented that these buildings were to be regarded as adding to the extent of 18,000*l.* to the assessable value of subjects within the burgh from Whitsunday last to Whitsunday next. They must be fully aware that before that period expired the buildings there must have ceased to exist. Under section 6 of the statute yearly value, actual or potential, must be the test of value under the statute. The committee were not tenants paying rent. They held occupation at the privilege of the Town Council. The only alternative for the Assessor was to ascertain what these buildings would let for from year to year, and if Mr. Paterson was going to address himself to that problem they could predict for him absolute failure. The only conclusion which a right construction of the statute would afford was, that the valuation roll embraced all lands and heritages capable of yielding an annual rent, and the exhibition buildings did not fall within that category.

Mr. Paterson, the Assessor, held that the argument used regarding the temporary nature of the buildings would apply to any in Edinburgh. A man might appeal against a valuation on the ground that his house might be burnt down before the year was out. He was quite willing to base his case on the other argument as to the lettable value of the exhibition buildings. A common labourer took a house at a shilling a week, and therefore it was entered in the roll at the yearly value of 2*l.* 12*s.* The whole question was—Is this a subject capable of being let from year to year, and if so, at what rental? He would state the grounds on which he arrived at the valuation stated. It had been reached on the basis of sums fixed by the appellants themselves. They got for premises in Old Edinburgh 1,824*l.*; they had got for refreshment bars 4,560*l.*, and they had got for allotted space 11,423*l.*, and these three sums made 17,797*l.* It was called an International Exhibition, but they could call anything an International Exhibition. Any four men—a Scotsman, a Frenchman, a German, and an American—might set up premises and call them an International Exhibition. And they might get somebody to take a back saloon in the premises and put in whisky barrels and beer barrels, and this person would have the privilege of selling whisky and beer, and would pay a rent. He could not understand where the difference was. It was only in magnitude. The exhibition was simply a great shop, and, added to it, they had the attractions of the general aggregation. They had a great many visitors, and they required meat and drink, and a sum of 4,000*l.* was paid for selling meat and drink. He could not understand why a man selling meat and drink in the exhibition should do so without the ordinary percentage and cost of any other assessment in the city. The police were at the exhibition, and it had also necessitated other public expenditure. He would only add that, in bringing up this case, he did not go into any great principles. His reason for serving the notice was simply this:—Here was an interference with the general trade of the city. In some cases, perhaps, it was a hardship on certain of the shopkeepers, who had to pay a heavy rent and taxes. He considered, however, that he would not be entitled to constitute himself a judge as to whether the exhibition should go without paying assessment. The matter was far more one for the Court to determine than for him.

In reply to Councillor M'Intosh,

The Assessor said he had previously assessed temporary buildings.



Mr. Young said he ventured to suggest that the malpractices of the Assessor in the past should not be a guide to the Court. Mr. Young added that if the exhibition was to be assessed, 5 per cent. on the actual outlay would be a fair course.

Mr. Brown asked for what reason the Forestry Exhibition was not assessed.

The Assessor: The reason was this:—When the survey was taken there was no building there, and before the supplementary survey it was away.

Mr. Young suggested that was a matter which the Court should consider, that if the exhibition had been held between August and April it would never appear in the valuation roll.

The Court adjourned to consider its decision, and returned after an absence of ten minutes, when Bailie Cranston intimated that the Court had found by a majority that the exhibition buildings were non-assessable.

THE SANITARY CONGRESS.

THE annual congress of the Sanitary Institute of Great Britain, of which the Duke of Northumberland is the president, with Lord Fortescue, Lord Brabazon, Sir Robert Rawlinson, and Mr. Edwin Chadwick, C.B., as vice-presidents, will be held this year at York, and will open on the 21st inst. The Social Science Association will not clash with the practical work which the Institute has set itself to carry out, and the congress will be limited to the consideration of matters affecting the well-being of the community at large. The president of the congress is Sir T. Spencer Wells, and the vice-presidents include the Lord Mayor of the city, the Archbishop of York, the Dean and Sheriff of York, the Duke of Westminster, the Marquis of Ripon, Lord Wenlock, Dr. Richardson, Dr. G. Buchanan, Sir J. Fayrer, the Baroness Burdett-Coutts, Miss Nightingale, Professor Humphry (of Cambridge), the chief aldermen of York, and the mayors of many Yorkshire towns. Sir T. Spencer Wells will give an address, and the sections, which are only three in number, will be, first, under Dr. De Chaumont, "Sanitary Science and Preventive Medicine;" second, under Mr. Baldwin Latham, assisted by Mr. E. C. Robins, "Engineering and Architecture;" and third, under Mr. W. Whitaker, assisted by Mr. G. J. Symons, "Chemistry, Meteorology, and Geology." Lectures to the working classes on Saturday will end the visit of the Institute.

THE SUBURBS OF ST. PETERSBURG.

THE ground on which St. Petersburg is built being at the embouchure of the Neva, on the Gulf of Finland, is subdivided by rivers of various sizes, and thus forms a series of islands. Two of those bounded on the north by the Great Neva are the Kamennoï Island and the Aptekarskoy Island. One of the journals of the city, the *Novosti*, gives the following account of the principal buildings on them:—

Of all the islands of the Neva the most beautiful is Kamennoï-Ostrov (Isle of the Stone). It is only 1,900 yards in length and 700 yards in breadth. Being of but slight elevation it is often submerged, and during the great inundation of November 7, 1824, it was covered by water to a depth of more than 7 feet. It was given in 1703 by Peter the Great to Golovkin, the *protégé* of Nathalie Naryschkine, in reward for a victory gained by him over the Swedes. The only house which then existed there was one constructed by Golovkin, facing the Island of Apothecaries. After his death the island passed into the possession of Count Bestoujew-Rumine, who spent large sums in its adornment. Fisheries were organised, together with a small restaurant, calling itself Vauxhall. The true prosperity of Kamennoï, however, began when Paul I., then Hereditary Grand Duke, became its proprietor. In 1775 he built a palace, which at this day preserves its primitive aspect, and where he loved to pass the summer. Three years after there was opened a hospital, which also exists at present, opposite the Gothic church of the Precursor, dating from the same year and built by the architect Velten, president of the Academy of Fine Arts. This church contains many souvenirs of the Emperor Paul, who was particularly fond of it, and used to visit it even at night for purposes of devotion. When the Order of Malta was introduced into Russia, the cemetery of this church was set apart as the place of sepulture for the knights without distinction of creed, a custom suppressed in 1807. The Emperor Alexander I. had the same affection as his father for Kamennoï as a summer residence, and thither his whole court followed him. In a house adjoining the villa grounds of the present Prince of Oldenburg, Capodistria then lived and afterwards Arakcheiev. At this period the first permanent bridge over the Little Neva was constructed—that of Bethencourt. The Grand Duke Michael, who inherited the island from his sister-in-law, the widow of Alexander I., placed as a trophy in his garden six guns taken from the Turks at Braila in 1828. The Stroganov Bridge and the Theatre Kamennoï-Ostrov, situated on a small square facing the Yelaghinskoï Bridge, were built in 1826. The architect, Schoustov, erected the theatre in one hundred days; it was opened by a concert of Italian artists, and Sonntag sang there in 1830. It was rebuilt in 1844 by Cavos, the architect of the Marie Theatre and of the Grand Theatre of Moscow. A French company of actors opened the new theatre, and to one of them, Allan, an adjoining house and grounds were given as a residence. The entertainments were varied—comedy, ballet, Russian opera, and spectacular pieces. At present years often elapse without any performance, though the building is maintained in its integrity. During the widowhood of the Grand Duchess Helen Paulovna, life at Kamennoï became very subdued. The gardens were closed to the public, and their mistress only showed herself in a carriage when a band played in front of the theatre. She, however, sometimes organised open-air concerts on a magnificent scale, and on one of these occasions ten grand pianos

AUSTIN'S
NEW IMPERIAL PATENT
SUPERFINE FLAX LINE.
The above article is now being manufactured and sold in large quantities for Greenhouse Sashes, Public-house Shutters, and other heavy work. The Manufacturers would recommend it for its strength, and the large amount of wear in it, consequent on its peculiar manufacture.
AUSTIN'S IMPERIAL PATENT FLAX SASH AND BLIND LINES (two Prize Medals awarded). The manufacturers of the above articles particularly wish to draw the attention of the trade to their Imperial Patent Flax Sash Lines, of which they are now making six qualities, all of which they can strongly recommend, as they have given unqualified satisfaction to the trade for now over One Hundred Years; and the Proprietors continue to give their personal attention to the manufacture of these goods.
They also invite the particular attention of the trade to their IMPERIAL PATENT BLIND LINES, which are very superior to anything yet offered.
They can be obtained of all Ropemakers, Ironmongers, Merchants, Factors, and Wholesale Houses in town and country.
N.B.—Please note that all our goods as advertised above are labelled either inside or outside, with our Trade Mark—The "Anchor."

were played on by forty hands. The palace and the island belong at the present day to the Grand Duchess Catherine Michaelovna. Formerly the island was distinguished for its numerous aristocratic villas, but now, with the exception of those of the Prince of Oldenburg, of Count Stroganov, and of Mr. Mordvinov, there are no longer any residents but merchants. In one of the villas facing Novaïa Derevnia the great poet Pouschkine lived fifty years ago.

Apothecaries Island is much larger than Kamennoï, from which it is separated by the Little Neva ; its length is two and a half versts, and its breadth one. In Peter the Great's time it had a powder factory and a small garden of medicinal plants (hence its name), the germ of the noble Botanical Gardens now existing in the same locality. In 1705 Roman Bruce defended Apothecaries Island against the Swedes who held Kamennoï, and forced them to retire. In the last century there were a great many country houses of a modest class, which still continued in fashion forty years ago. The composers Glinka and Dargomyjski, as well as the poet Batuschkov, had their homes there. These suburban pastures have often been resorted to by our novelists. At present people in trade are in almost complete possession of Apothecaries Island, where formerly numerous aristocratic villas were to be found. Thirty years ago one went to see the camellias and the orangeries of Count Nesselrode, and the stags in the park of Prince Lopoukine, whose place was since bought by Gromov. The latter had in his service the famous gardener Odintsov, by whose aid he worked marvels in the grounds of his villa. The wealthy Garfunkel, who had about the same time bought the superb demesne of Count Gouriev, wished to compete with him, but was ruined in the effort. Later on many fruitless attempts were made to make the property pay with *cafés* and casinos, and the attraction of gipsy and Tyrolean musicians. We may mention the fate of another ci-devant villa, that of Voronine, whose proprietor used to regale his guests with sturgeon 150 lbs. in weight, served on silver ; his house is now an asylum for pauper children. A large number of small country houses have lately been demolished to make room for a timber-yard. There were two cemeteries in Apothecaries Island in the days of the founder of the city, one of them for Germans. Contemporary writers relate shocking things about the robbery and desecration of the coffins which took place nightly. An extensive vegetable garden now occupies the site of these horrible scenes. Twenty years ago the villa gardens of Sapojnikov, one of the lights of the Russian sporting world, skirted the cemetery, and at a little distance stood the famous Laval demesne and park which had belonged to Count Borch. Two other properties noted for beautiful flowers and exotic plants were those of Zoubov and Viazemski, situated along the Kamennoï-Ostrov Prospect.

SEA WATER FOR WATERING ROADS AND FLUSHING SEWERS.

A REPORT has been presented to the Bournemouth Commissioners by Mr. G. R. Andrews, C.E., the surveyor, on the extent to which sea water is used for watering roads in various towns. It contains the following replies from town surveyors who were asked for information :—

Portsmouth.—I beg to inform you that about two years ago I introduced salt water for the purpose of watering the streets and the supply of our public baths. I am of opinion that where salt water can be pumped at a cost not greater than that which fresh water would entail, it is better to use salt water than fresh for the purpose of watering streets. The effect lasts much longer, so that less watering is required. From my observation, I think salt water disintegrates granite roads a little ; but with gravel roads my opinion is that the effect is to bind them, and thus improve them. The effect of watering with sea water is no doubt to cause a greater humidation or dampness upon the surface of the roads than when fresh water is employed. In addition to this, a sort of film or skin is formed upon the surface, which keeps down the dust and apparently tends to preserve the road. It has been stated that the action of the brine on the organic matter on a road has a bad effect, but I have not hitherto found this to be the case : on the contrary, I believe that dampness, accompanied with salt, which is a preservative, would cause less nuisance than the same amount of dampness where the salt was not present. I am of opinion that the use of salt water for watering roads is economical, not only because it can be pumped for about threepence per thousand gallons as against sixpence which is paid to the Water Company, but also from the fact that one load of sea water will go as far as three loads of fresh. I have noticed, however, that with granite macadam roads, the effect of watering with salt water is slightly to disintegrate the surface. This is very noticeable when a slight shower falls upon a macadam road after it has been well watered with salt water. This effect is not so noticeable with gravel roads, and I therefore think

ARTISTIC SANITARY WALL-HANGINGS.

DURO-TEXTILE, Combines all the artistic and hygienic effects of a Painted Wall, at a great saving in cost. Can be SCRUBBED with Soap and Water any number of times without injury.

MURALINE, a highly-finished artistic washable Wall Paper, in beautiful designs and colourings.

EMBOSSED TAPESTRY, a high-class Wall-Hanging, fitted for superior Decorations, made in the most striking effects.

Patterns are kept by all Decorators and Upholsterers, or will be sent on application to

STOCK AND SHARE BROKERS.

Messrs. COLES, STEWART & CO. undertake every description of Stock Exchange business, and have special and early information on all leading Stocks; they are also continually advised by telegram from the chief Mining centres, both at home and abroad. For Investment Messrs. C., S. & Co. make only one charge of $\frac{1}{16}$ per cent. commission on all descriptions of Stocks, and open Speculative accounts with from 1 per cent. cover and upwards, without any further risk or liability to their clients whatever.

THUS, £5 commands £500 Stock; £10, £1,000 Stock; £50, £5,000 Stock;
And so on to any amount.

In the transaction of speculative business Messrs. C., S. & Co. make no charge for commission or brokerage whatever unless their client makes a profit, when they take 5 per cent. of the profit made as their remuneration.

All transactions advised by wire as soon as completed. Monthly Circulars and Mining Reports post-free on application.

COLES, STEWART & CO., St. Stephen's Chambers, LONDON, E.C.

that watering with salt water is better adapted for gravelled than for macadamised roads. It has also been stated that the effect of watering roads with salt water which are adjacent to shops containing delicate goods such as silks, jewellery, steel, &c., is likely to cause some damage to these goods, owing to the air containing a more than usual quantity of moisture, but of this statement there seems to be no proof.

Weymouth.—The principal streets of this borough are watered with sea water, giving great satisfaction. The salt forms a crust on the surface, which keeps the dust from rising.

Harwich.—We have used sea water for street watering and for flushing our low-level sewers since 1879, with very satisfactory results. My Board have just received the sanction of the Local Government Board, and intend to put down one of Davey's 2 horse-power motors and build a reservoir, so as to have a constant supply of sea water for watering suburban roads and for flushing our high-level sewers. My own experience is that sea water does not tend to disintegrate the roads; that it keeps the dust down at least twice as long as fresh water; that it mixes with disinfectants—Sanitas and Jeyes' perfect purifier; and that the cost of getting and distributing is from 25 to 27 per cent. less than the cost of fresh water at 1*s.* per thousand gallons.

Grimsby.—With respect to the advantages of using salt water on the roads, I think I may safely say that my committee are so pleased with the results that they do not intend to revert to the fresh water, even when the company are in a position to supply it. The salt water, when it has dried on the roads, leaves a thin coating of salt on the surface, which prevents the dust rising, and also when the air becomes humid the salt seems to give, and it keeps the road always moist. I might also state that last year we saved 72*l.* on our street watering account through using salt water.

Great Yarmouth.—The cost of water to supply these flushing tanks and the large movable tank led to discussion as to whether it would not be advisable to provide our own supply for sewer flushing and street watering. Of course opposition was raised to this. Scientific evidence was obtained to prove that sea water would be both injurious to roads and health, and under my advice the opinion of the borough surveyor of Portsmouth was obtained on this subject, and at the inquiry held before the Inspector of the Local Government Board, he completely (or at least to the satisfaction of the Inspector) demonstrated that all the evil charges made against it were untrue, and that much good might be expected both on roads and in sewers by its use. I had had previous experience in road watering with it; found that it was much more efficient in laying dust, and that roads in the summer-time were less liable to break up than where fresh water was used, but advised that one section of the town should be watered for a whole season. This was done. A large expense was saved in quantity of water used, and also gravel, which it had been necessary on previous occasions to use for patching. The Council had, during the year previous to this matter being brought on, used about ten million gallons of the Company's water to flush sewers and water the roads in the district which I proposed should be served with sea water. This ten million gallons had cost 552*l.* 0*s.* 6*d.*, while the average cost of the water for seven years, in which little or no flushing had been done, came to 404*l.* 6*s.* 7*d.*, and I estimated that to supply the flushing necessary to keep our sewers clean would involve an outlay of at least 700*l.* per annum, and for this we should receive about fourteen million gallons only. The scheme I prepared involved fixing an Otto gas engine of eight horse-power (making the third I have now fixed for this Council, the previous ones working admirably), with pump, the erection of a tower and cast-iron tank to hold twenty-two thousand gallons, six miles of distributing pipes of 8-inch, 7-inch, 6-inch, 5-inch, 4-inch, and 3-inch internal diameter, with forty valves for flushing and forty hydrants for street watering; six flushing tanks of two thousand to three thousand gallons capacity are also included (making twelve I have now at work), and much to my surprise my estimate only came out at 4,500*l.*, and Messrs. H. F. Snow & Co., of London, are now at work upon the scheme, and within a month of completion, the contract price being 3,987*l.*, while works not included in this contract may perhaps amount to about 200*l.* These figures give a clear gain to the Corporation, as may be seen below :—

Interest and repayment of loan on 4,500*l.*	£270 0 0
Working expenses, depreciation, and small additions per ann.	140 0 0
Total annual cost	£410 0 0

For this sum the plant I have erected will raise in 120 days of ten hours each thirty million gallons, of which about five million gallons will go to the streets, while the remaining twenty-five millions will go into the sewers; and more can be raised at less than 1½*d.* per thousand gallons, as less water is used for street watering. A considerable save will also be made in horse hire. This I estimate at about 80*l.* per annum.

A. R. CONSTANTINE, 61 FLEET STREET, E.C.

N.B.—Judges have conferred Greatest Honours, Highest Awards, Gold and Silver Medals at all Competitive Exhibitions. ESTABLISHED A QUARTER OF A CENTURY.

Birkenhead.—Salt water pumped from the docks has been used in this borough, especially the central portion, for a great number of years for street-watering purposes. Also that a spread of salt water on a macadam road is as effective in laying down the dust as three spreads of fresh water; so that the tradespeople rather prefer the use of salt water for this purpose. There is just the question, in a town where there is much carriage traffic, of the salt water having a tendency to corrode the tires of the wheels. So far, however, we have had only two complaints of this in Birkenhead, although, as stated above, salt water has been in use many years.

*Blackpool.**—We use sea water for watering streets and flushing sewers. I beg to inform you that we use nothing else. Our streets are all watered with sea water, and practically I find no grievance arising therefrom. We also flush our sewers with sea water, and have found no serious consequence.

Ryde.—We use salt water for watering streets and find it very advantageous. I consider one load of salt water is equivalent to two loads of fresh; it also makes a hard crust on the road.

Hastings.—I find it a great advantage; the salt water keeps the roads damp for a much longer period than fresh water, and it is a capital thing for flushing sewers, gulleys, &c. Here salt water mains run over the greater part of the district for street watering, gulleys, &c., and of course the supply is unlimited. I think if you adopt this system you will never regret it.

Worthing.—I beg to say that we have watered a considerable portion of our town with sea water for many years. My experience is that it keeps the roads damp at least twice as long as fresh water, and forms a kind of crust on the surface of the roads, which not only keeps them together, but also prevents the dust from moving for a considerable time after they are dry.

Plymouth.—We use sea water for road watering as much as possible. It answers perfectly for macadam roads, but makes paved roads very slippery.

Liverpool.—Sea water possesses the advantage of remaining moist for a greater length of time, especially when the atmosphere is slightly damp. Its disadvantages are—greater injury caused to the valves and distributing pipes of the water-carts; and, as you may be aware, it is said to be injurious to some textile fabrics, but as a matter of fact we have had no complaint of this from silk mercers or drapers.

New Shoreham.—I beg to inform you that I use salt water for both purposes—watering roads and likewise flushing. Have found where used on the roads they are more lasting and much harder than roads watered with fresh, and take twice the time to dry than if fresh water had been used.

Whitby.—We use sea water for watering in certain parts, chiefly for the larger portion of the town, and find it answers our purpose much better than fresh. The saline matter appears to leave a coat on the road surface which causes it to remain smooth and compact much longer than when fresh water is used. This, however, though an advantage on comparatively level ground, is, as you will readily see, somewhat of a disadvantage on hills, as they become so firm and smooth that horses cannot stand on them, and when all our streets are watered with salt water I soon have complaints. Our general rule, which I find a perfectly safe one, is to use salt water (sea water) for all streets whose gradient does not exceed 1 in 20. This, in our exceptionally hilly town, excepts several streets, though I do not suppose it will affect you much.

Tynemouth.—I beg to inform you that sea water is used in this borough for watering the streets and flushing the sewers. The advantage it has over fresh water for watering the streets is that it hardens and binds the surface of macadamised roads, and one watering with salt water would equally serve as well as two or three times watering with fresh water.

Upon receiving the above replies, I thought it necessary to visit the following towns:—Portsmouth (which includes Southsea), Hastings and St. Leonards, and also Great Yarmouth, and at these places from personal observation, I have great pleasure in stating I am able to bear my testimony in support of the experience of the above coast towns. At Southsea the roads have been watered about two years, and the public baths supplied with sea water. At Hastings and St. Leonards the roads have been watered for about eighteen years. They also supply the hydropathic establishments, baths, hotels, and other places with sea water. At Great Yarmouth the works necessary for pumping sea water with mains, tower, with cast-iron tank, &c., for watering the streets and flushing the sewers have been completed about six weeks, and after inspecting the works I have no hesitation in saying it is the most complete work of its kind.

Mr. Andrews has recommended the use of sea water in Bournemouth, by which a saving of 280*l.* a year is anticipated.

* The sea water works belong to a private company, who have a large tank and pumping engine.

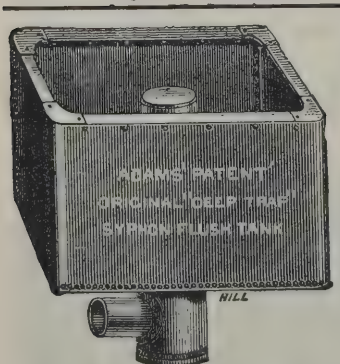
ESTABLISHED 1844.



BRADSHAW'S LIMMER ASPHALTE

Messrs. BRADSHAW & CO., being Sole Agents in the United Kingdom for, and possessing proprietary rights in, the Freehold Mines of the German Asphalte Company (of which Mr. C. W. Bradshaw is also a Director), situated at Limmer, near Hanover, and Vorwohle, Brunswick, possess special facilities for reliable and prompt delivery of their celebrated "LIMMER ASPHALTE" at low rates, either for sale in its natural state or ready for laying by their own workmen in any part of the United Kingdom. EACH BLOCK supplied from these Mines, besides bearing the impress of the Company, is stamped with the words "BRADSHAW & CO." The attention of Architects, Engineers, &c., is particularly called to the fact that the "LIMMER ASPHALTE" is especially suitable for use in the construction of Reservoirs, Roofs, &c., where water-tightness is extremely essential. For such purposes **Over 2,000,000 (Two Millions) of Square Feet of "Limmer Asphalte"** have been executed by Messrs. BRADSHAW & CO.; while for Paving purposes **Over 50 Miles of "Limmer Asphalte" Footways** have been laid by them in the LONDON DISTRICT ALONE. Messrs. BRADSHAW & CO. will be happy to forward Prices, Samples, and Testimonials, and give all information on application to :—

R. ADAMS,

17 BLACKMAN STREET & 7 GREAT DOVER STREET, LONDON, S.E.,

INVENTOR and PATENTEE of the

SAFETY WINDOW WITH REVERSIBLE SASHES

FOR INEXPENSIVE AND PERPETUAL CLEANLINESS,

Which has gained at the INTERNATIONAL HEALTH and SANITARY EXHIBITIONS

Two Gold, Four Silver, and Four Bronze Medals, and Sixteen Diplomas of Merit.

IMPORTANT NOTICE.

The Patentee has been advised by several of his friends to form a Company for the Manufacture of the above-mentioned Sashes in larger numbers, for the supply of the Trade and for the Home, Colonial, and Foreign Markets. Hitherto he has only supplied the Fittings, except under very special circumstances. He now proposes to manufacture the Sashes complete with Fittings.

Provisional Protection has just been granted for another Patent, whereby the Sashes will be greatly reduced in price, and, consequently, brought within the requirements of every Architect and Builder.

If any of the readers of this journal wish to receive further particulars or to take Shares in the proposed Company, they are requested to make early application to the Patentee, as it is expected that the larger number of the Shares will be privately subscribed.

Applications for Shares will be taken in the order in which they are received.

HIGH WYCOMBE.

For Laying Limmer Asphalte Footways in Castle Street, for the Corporation. Mr. J. BOWEN, A.M.I.C.E., Borough Surveyor.

BRADSHAW & Co., London and Bristol (*accepted*).

VOLUME XXXV. OF THE ARCHITECT.

Handsomely bound in Cloth, Gilt Lettered. Price 12s. 6d. Office: 175 Strand, London, W.C.

The Celebrated "DUBOIS" Hydraulic Drawn Lead TRAPS and BENDS.

The above Shapes and Sizes always in Stock, and we are prepared to furnish SPECIAL SHAPES to order at short notice. These justly celebrated TRAPS are made from Pure Pig Lead by Hydraulic Machinery after the manner of Lead Pipe, and have peculiar advantages appreciated by every Plumber. They are greatly superior to either Cast or Hand-made Traps, as they have no SEAM, are of UNIFORM THICKNESS, PERFECTLY SMOOTH INSIDE AND OUTSIDE, and can be FLANGED, PLUGGED, and STRETCHED, without fear of SPLITTING. No possibility of Sandholes.

FOR PERFECTION OF MANUFACTURE THESE GOODS ARE PRE-EMINENT.

For Sale generally by the principal Lead Merchants and Wholesale Dealers in Plumbing and Sanitary Appliances throughout Great Britain and Ireland.

ARTISTIC FURNITURE IN ALL STYLES
Estimates Given at Wholesale Prices for Furniture made to Architects' Designs.

BUILDERS' SCREENS, unequalled for Strength, Durability, Efficiency, and Cheapness. Also Castings of all descriptions.—STEVENS & CO., Ceres Ironworks, Kingston-on-Thames.

GRUNDY'S PATENT
WARM-AIR
VENTILATING FIRE GRATE.
The novelty, superiority, and advantage of this patent consist in the heating surface being greater than any other Fire-grate introduced to the public. It is very simple in construction, and is made in the form of a Stove, the back of which is semicircular in shape, with gills behind and smoke-nozzle on top, all cast in one piece. The same can be attached to any design of a Register or Stove front. It is very suitable for schools, class-rooms, waiting-rooms, hospitals, offices, dormitories, and dwelling-houses, from the cottage to the mansion. Design and specification post free on application.
TESTIMONIALS.
"9 Victoria Chambers, Westminster, S.W.: June 10, 1884.
"SIR,—I have much pleasure in testifying to the efficiency of your patent warm-air fire grate. It has been very successful, and given every satisfaction where I have used it. Yours, &c.,
JAMES WEIR, F.R.I.B.A."
"To Mr. Grundy.
"6 John Street, Bedford Row, W.C.:
"December 16, 1885.
"DEAR SIR,—I have now had an opportunity of testing your patent grate, and am glad to be able to say that I am most agreeably disappointed, because, as you are aware, I was rather sceptical about its powers when you showed it to me; but now I can say it answers admirably, and heats abundantly my porch-conservatory.—I am, yours truly,
"R. S. LANDER, F.R.I.B.A.
"To Mr. John Grundy."
From James Garry, Esq., Architect, West Hartlepool, July 1884.
"DEAR SIR,—I have very great pleasure in stating that the first stove, or patent warm-air ventilating fire grate, adopted by me in school at Seaton, and a second in a Cocoa Palace, have given such satisfaction that I now order eleven to be inserted in New Upper Grade Schools in course of erection at West Hartlepool. They are the most economical, efficient, and easily managed stove at present before the public.—Mr. John Grundy."
From Hon. and Rev. G. G. C. Talbot, M.A., Withington, Cheltenham.
"DEAR SIR,—You will be gratified to hear that the school is completely warmed by your new grate. It is the most economical and efficient that I have ever seen.—Mr. John Grundy."
Society of Architects, Architectural and Building Trades Exhibition, 1885:—"5 Great James Street, Bedford Row, May 1.—The warm-air ventilating grate shown by Mr. John Grundy at Stand 75 Floral Hall, is an admirable contrivance for utilising the heat conducted through the back and sides of the stove, for warming schools and buildings by a supply of freshly warmed external air."
Apply to JOHN GRUNDY, 30 Duncan Terrace, City Road, London.—Works: TYLDESLEY, near Manchester.
Agent for Scotland, SEPTIMUS HARPUR SMITH, 1 Upper Gilmore Place, Edinburgh.

TRADE NOTES.

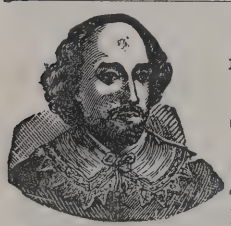
MR. J. HARTLEY, of Birmingham, has obtained the contract for building the North-Western goods station at Nottingham, at a cost of about 50,000*l.*

MESSRS. DAVIES BROS., of Wrexham, who have secured the contract under the Liverpool Corporation for constructing a reservoir and filter beds, and for carrying out other works in the neighbourhood of Oswestry, have commenced work. The contract amounts to about 70,000*l.*

A MEMORIAL WINDOW, two light, is to be placed in St. George's Church, St. Kitts, West Indies, in memory of the late Rev. George Arthur Collins, senior master of St. Kitts High School, and senior curate of St. George's Church. Subjects, the *Resurrection* and the *Ascension*. The work has been executed by Messrs. T. Baillie & Co., 187 Wardour Street, W.

MESSRS. LOBNITZ & CO., Renfrew, have secured the contract to build a pontoon or floating dock, 165 feet long, for work in connection with the Panama Canal.

MR. GEORGE REES, of Savoy House, Strand, scores another success with *The Firstborn*, engraved by Mr. S. Arlent Edwards, after Mr. G. Hillyard Swinstead. This is truly a scene of the interior of an English homestead in a country farm. The mother of the child sits against the deal table in the centre, with her firstborn on her knees, while the young husband, whose face has an expression of entire contentedness, is attracting the attention of the child by showing it a puppy collie. The picture is one of the best efforts of this engraver, and should secure it a ready sale to all lovers of art treasures.



THE Prison Commissioners of Scotland have extended the time for the completion of the proposed convict prison at Peterhead from thirteen to sixteen months.

A COMMERCIAL museum has been established at Liège. It is divided into two sections, the first embracing articles of import, with a statement in each case of their origin, their price at the port of shipment, cost of transport, customs duties, and conditions of sale. The second section is devoted to articles in demand in foreign markets, together with particulars as to the packing of the goods, and conditions under which the same should be delivered to the purchasers.

ST. SAVIOUR'S WORKHOUSE, CHAMPION HILL.—After careful tests of various stoves, Messrs. Yates, Haywood & Co., of Rotherham and Upper Thames Street, E.C., were again successful with their so-called War Office Ventilating Stoves, which have been ordered for warming this large and handsome building, of which Messrs. Jarvis & Son are the architects. It is only a year or two ago since we recorded a similar competition for the Fulham Union, when this same stove was chosen. We have not had the opportunity of examining it, but there must be some special excellence in a stove that has often stood the tests of competition, and which has been adopted for War Office hospital use, and supplied to the Fulham Union (architects, Messrs. Giles & Gough); the Homerton Infirmary (architects, Messrs. Lee & Smith); the Wandsworth New Workhouse (architect, Mr. T. W. Aldwinckle); the Croydon

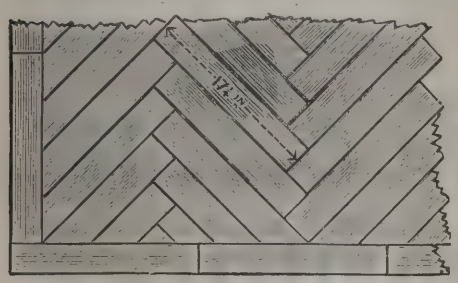
Union (architects, Messrs. Burney & Mundey); the Wellington Barracks, Portsmouth; the St. Saviour's Workhouse, Champion Hill; and other similar institutions. The cooking-ranges, of which there are a large number, were also the make of Messrs. Yates, Haywood & Co., and are of similar kind to those they supplied to the Darenth Small-pox Hospital, of which Messrs. A. & C. Harston were the architects.

AN English syndicate has submitted a proposal to the Municipality of Brussels for placing the city in direct communication with the sea. The conditions of the contract are stated to be as follows :—The canal to the Scheldt is to have a depth of 6½ mètres, or 21 feet 4 inches; the quays are to be sufficiently spacious to admit twenty ships of 2,500 tons each to lie alongside; the docks and quays are to be furnished with every modern appliance for loading and unloading vessels, and with warehouses and sheds, and are to be connected with the great lines of railway. The company is said to demand as remuneration an annual subsidy of 1,800,000 frs., to commence only from the date of the completion of the work.

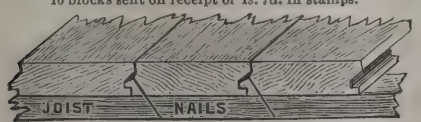
THE EXHIBITION AND CONGRESS OF THE SANITARY INSTITUTE OF GREAT BRITAIN AT YORK.

THE ninth annual congress and exhibition of the above-named Association was opened at York on Tuesday last, under the most favourable auspices. We have often dilated upon the difficulties experienced by the Institute in being enabled to obtain suitable buildings in the towns they from time to time visit to hold their annual exhibitions. A town may possess certain public buildings that, so far as size goes, may be large enough for the requirements of the Association, but they may not be adapted for the heterogeneous character of the exhibits that the enterprise of the popular curator to the Institute, Mr. E. L. Box, annually manages to draw under his wing. At Leicester last year they were fortunate, but in the ancient cathedral city and episcopate of the north they have secured advantages that they can scarcely expect to achieve in any city in the kingdom, for we do not remember any other that could place at their disposal such a large and well adapted building for the purpose. Nor could York have held out such inducements a few years since, but the building known as the Fine Art and Industrial Exhibition, which was erected in 1879, and which contains a picture gallery of no mean pretensions (also opened to the visitors patronising the Sanitary Institute Exhibition), has placed the authorities of the city in a position that may well be envied by many others, and here it is that the exhibition of the Institute is located, and in one of the adjacent rooms the president of the year, Sir T. Spencer Wells, Bart., delivered his opening address on Tuesday evening. The alteration of the name of the exhibition from sanitary to health exhibition has opened the door to some extent for a more comprehensive assortment of exhibits. In looking through the stands, although we may admit that there is nothing among the exhibits that would have been refused under the old *régime*, there is no doubt that the change of name has had its effect, and the York Exhibition, so far as diversity of exhibits are concerned, may be called a reproduction in miniature of the late Healtheries at South Kensington. There are naturally many displays among the exhibits that are not interesting from a professional or technical standpoint to our readers, but such as are will be described in our next issue.



NOTES ON NOVELTIES.

THE SPENCER CORONA CO., of 3 Hyde Street, New Oxford Street, W., make the announcement that by the use of their patent corona, ceilings never become blackened. Important experiments have shown that the amount of light given by a flame depends also on the temperature of the air surrounding it; the higher the temperature the greater the amount of light. This result is obtained by the use of the Spencer corona, which also regulates the amount of air supplied to the flame. The great merit of this invention is that all former coronas have only dispersed the carbon about the room, and prevented it forming one black spot immediately above the flame: the Spencer absolutely consumes the carbon. We have no doubt that, once this patent is known, it will be largely adopted by architects and the trade.



BERMONDSEY MORTAR.

A MEETING of the Bermondsey Vestry was held on Monday when the sanitary inspector reported that he had discovered that the mortar used in the erection of several new houses in the course of construction in Long Lane was largely composed of sediment taken from the sewers, and he understood that it

WILLIAMS & CO.,
Lillie Bridge Works, London, S.W.,
MANUFACTURERS OF PATENT
METAL CASEMENTS
AND
LEADED WINDOWS.
Our Patent Steel "SIMPLEX" Casements have the following advantages over any other Casements in the market :—
They are thoroughly weathertight.
They can be made to open inwards or outwards, hung at the sides, or head, or sill, and in all cases the PLANE OF GLASS and the SIGHT LINE are the same.
They will not SAG, or TWIST, or JAM.
The Glass being secured by metal fillets the ragged appearance of putty is avoided.
The face being moulded has a more pleasing appearance than the ordinary uncouth finish.
By the use of these Casements all difficulties of window-cleaning are overcome.
The Patent "Cottage" Casement is made for such positions where plane of glass and thorough weathertightness are not absolute requisites, and where the extent of finish is not necessary.
Prices and particulars will be gladly furnished on receipt of inquiry.

VOLUME XXXV. OF THE ARCHITECT.
Handsomely Bound in Cloth, Gilt Lettered, price 12s. 6d.
Office: 175 Strand, London, W.C.

had been sold to the builder by the contractor to the Metropolitan Board of Works. He had ordered the removal of the stuff under the Nuisances Removal Act, and he respectfully asked the vestry to take such steps as would in future prevent such substances being used in connection with the construction of human habitations, for it was most dangerous to health. In reply to a member, the officer said the stuff had not actually been mixed with mortar when he saw it. Mr. Dumphries said he saw the "filth;" it was nothing more nor less than the deposit of matter which had been taken from the sewers, and he desired to know if the Board of Works approved of their contractor selling such stuff to builders. Mr. W. Shepherd, of the Metropolitan Board of Works, proposed that the Board should be written to upon the subject, and the facts of the case brought under their notice. Mr. Vice seconded this, and it was agreed to.

CO-OPERATIVE WORKSHOPS IN FRANCE.

A GOOD deal of attention has been given by political economists to the experiment in co-operation which was attempted in 1838 by M. Leclaire, a house painter in Paris, having about two hundred men in his employment. Even in the first year his success was remarkable, and although he relinquished a large part of his profits, M. Leclaire was able, after a time, to acquire a handsome competency. John Stuart Mill says that M. Leclaire set a beneficent example which found imitators among large employers in Paris. The latest of the Foreign Office Reports is devoted to the subject of co-operation as it is practised on the Continent and in America. Mr. Egerton, of the Paris Embassy, gives an account of the present state of the Maison Leclaire. The system has been altered since 1865, when Stuart Mill last described the establishment. At that time there were three partners, viz., M. Leclaire and M. Defournaux, who each received 240*l.* a year for superintendence, and a Provident Society, made up of all the employés, represented the third partner. Each partner had invested 100,000 frs., but the employés received one-half the profits, although owning no more than a third of the capital. It was agreed that on the retirement of the private partners the whole of the goodwill and plant should become the property of the Provident Society. At present the employés appear to have the entire control of the Maison Leclaire, but another title has been substituted, for the establishment now is known as Redouly & Co. The French of late appear to have a passion for obliterating names that were likely to be interesting. The following is Mr. Egerton's report:—

M. Leclaire, originally a working painter, having started a workshop, determined not only to interest his workmen in the profits, but by degrees to educate them to be able to take in hand his whole business. His aim was that they should advance by practical proof given of their individual capacities.

He began in 1838 by a mutual benefit society (Société de Secours Mutuel), to which he made over 25 per cent. of the net profits. This fund was not only for aid in case of illness and for pensions, but was intended to produce a capital to be employed in the business itself.

Every workman invalided was given from this fund (unless his illness were caused by drunken habits or vice) 2 frs. 50 c. a day; this was increased to 5 frs. after 1881. The pensions were fixed at from 500 frs. to 1,000 frs., and were always granted in cases of accidents or serious chronic illness, or after twenty years of service to those over fifty. This pension was increased after 1881 to 50*l.* Half of the pension reverted to the widows or orphans. Thus in 1877 36,450 frs. were paid to twenty-four old members and eleven widows, and these pensions rose in 1881 to 46,800 frs., thirty-four pensions to members and ten to widows and orphans. In case of a workman leaving the house before he is entitled to pension he receives 20 frs., the amount of his subscription to the benefit fund, and 10 frs. for each year of active service. This last sum is increased to 20 frs. for the widows of members who have died in active employment. Notwithstanding these heavy charges the fund possessed in 1877 a capital of 906,000 frs., which in 1883 had grown to 1,412,224 frs.

The co-operative part of the business itself is thus organised:—

Free or temporary workmen. Candidates for the nucleus ("noyau").

The "noyau" comprises the associated workmen and employés.

The "noyau" and the candidates for the "noyau" form about a quarter of the total number employed, say about 120 of the "noyau," and about 100 candidates. Beyond five years of service in the house, there is no condition but good work, conduct, and capacity for admission to the "noyau." The members of the "noyau" itself elect by simple majority of votes, after previous examination, and report those whom they judge fit to belong to it.

75 PER CENT. LESS FUEL BURNT BY USING CONSTANTINE'S

PATENT "TREASURE"

COOKING RANGE,

With the Patent Rising Fire Grating for reducing or enlarging the Fire. The FIRST PRIZE was awarded to the Patentee, after nearly one thousand tests of a variety of Ranges, by the Smoke Abatement Exhibition, Ladies' Committee, South Kensington, as well as the Grand Prize by the Exhibition, First Silver Medal. Vide *Times*, July 18 and 19, 1882. Also received Highest Awards at the Medical and Sanitary, the Fisheries, the Health, and the Inventions Exhibitions.

DISTINCTIVE MERITS:—*Perfection in Cookery—Economy in Fuel—Smoky Chimneys effectually Cured—Unsurpassed for Durability—May be placed anywhere.*

Illustrated Price Books, with Testimonials, Post Free.

A. R. CONSTANTINE, 61 FLEET STREET, E.C.

N.B.—Judges have conferred Greatest Honours, Highest Awards, Gold and Silver Medals at all Competitive Exhibitions. ESTABLISHED A QUARTER OF A CENTURY.

The members of the "noyau" have the following privileges:—If the general council approve, they receive 25 c. per day in excess of the salaries given for similar labour by the City of Paris. This addition to their pay is not given at once, but at the end of the year. They name the members of the "committee of conciliation," which is charged with the order and inspection of the business, with giving advice, and with inflicting the prescribed penalties. They name the overseers, the new members of the "noyau," and the two delegates, who have to examine, in concert with the president of the benefit society, the balance-sheet; and they have to see that the division of profits has been made in conformity with the statutes. (Publicity is necessary in all "sociétés anonymes.") They are entitled to the pensions above mentioned.

The two members who manage the house and represent it are chosen from and elected by the "noyau." These managers of the business receive 6,000 frs. yearly, and 25 per cent. of the net profits. The senior manager receives two-thirds of this, the junior a third. Beyond this the managers have no personal vested right in the house, and in case of death or leaving the house are simply replaced by election. The president of the benefit society may even move that they be replaced. Each of these two managers must be interested in the house to the amount of 100,000 frs.; but, in order that the want of this capital may not be an obstacle, this amount may be formed by the accumulation of two-thirds of the profits due each year to the newly-named manager, and the manager who is replaced can only withdraw his share in proportion as that of his successor is made good.

The remainder of the common working capital, say 200,000 frs., is given as a deposit by the benefit fund. The house is, in fact, the property of the picked body of workmen which constitutes the "noyau."

Twenty-five per cent. of the profit goes, as I have said, to the managers, 25 per cent. to the benefit fund, and the remaining 50 per cent. is divided amongst the workmen and employés of the house *pro ratâ* of their salaries. Practically, therefore, the workmen and employés are thus paid over 75 per cent. of the net profits.

The proportion of the profits to the salaries grew gradually to 12, 14, and 16 per cent. up to 1877, and in 1884 it reached 20 per cent., when the amount was 322,500 frs.; in 1882 the profits were 22½ per cent. more than the total amount paid for salaries.

The "noyau" does not of course directly interfere in the general direction and daily management, which is in the hands of the two managers.

It is interesting to see the use made of their profits by the workmen. In the year 1877, out of 135 workmen, 63 put their shares of profits in the benefit and savings funds, or in shares—capital invested in the house receives 5 per cent. a first charge, but does not participate in the profits; 17 spent them on their families, 16 paid debts made during want of employment or illness, seven put them into small shops kept by their wives or children, and one paid the money he still owed for exemption from military service. This is demonstration of the saving tendencies of the workmen.

In the Commission of 1883 it was stated in evidence that 3,326,142 frs. had been distributed amongst those employed by this house, as shares of profits or bonus from 1842 to 1882.

The element of success was, according to the evidence, the formation of the picked intelligent body of workmen called the "noyau." The idea of equality of pay would, it is said, be looked on by them as ridiculous. They had been at one time rather hampered by agitators, but the men had soon the sense to see where their true interests lay, and broke with them.

Co-operation under a different arrangement exists since 1877 in the large manufactory of kitchen and heating apparatus at Guise founded by M. Godin. It is known as the "Familistère"—a word that was probably derived from the "Phalanstère" of Fourier. In 1883 there were about 900 directly interested in the business of the establishment.

According to Mr. Egerton, the workmen are paid according to their capabilities, after free discussion before a council of their fellows.

The division, too, of profits is made on a graduated scale. Thus a first-class member (associé)—picked workmen of long service, of whom in 1883 there were seventy—receives twice as much; the second class (sociétaire) half as much again individually (there are 100 such) as the "participants" or third-class members (of whom there were 800).

M. Godin has found great advantage in this division of profits. The work has much improved, the hands much more careful to guard against mistakes, and that the interest taken in the business by the hands has much increased is shown by the constant new inventions and improvements made by the men. Since they were made partners a great number of patents have been taken out by the "Familistère."

All the workmen have a portion of their pay and profits reinvested in the house, and by this system M. Godin, the

original founder of the business, is being gradually bought out of it, and he means that this system shall continue. It is more generally beneficial, he considers, that the buying out in rotation shall continue indefinitely, so that those who have long profited by the great advantages of the institution—and have in fact enriched themselves—should in time give way to the young and poor who are beginning. Naturally, of course, this process is slow, as the capital of the business is increasing.

M. Godin practically keeps a certain management of the business in his own hands, though theoretically the business is managed by three councils or boards, viz. the board of management which meets monthly, the business council which is held every week, and the council for the management of the buildings and the commercial business.

Enormous buildings have been constructed by the association, so as to lodge the hands and their families. Some of the members, more especially the second class, or "sociétaires," are bound to live in these houses.

M. Godin, in his evidence before the Commission of 1883, gave very full details of the working of this remarkable and useful establishment, which is a complete partnership and co-operation of capital and labour. A branch of this "Familistère" has been founded near Brussels, and is successful.

The evidence given to the Commission of 1883 shows immense variety in the details of the systems adopted by the various co-operative societies, and by those firms where the profits are shared by the workmen: but all managers of houses, and those who have practical experience, were agreed that the system of co-operation and of sharing profits puts an end to strikes and improves production and good relations. Some associations, as that of the opticians, even took active part with the employers of labour in opposing a strike.

There has been no case of disposition to strike for increased share of profits. M. Roberts, an important witness, scouts the idea of this as a future danger.

The objection of some heads of houses to their workmen sharing profits seems to proceed mainly from dread of the extra trouble of management and account-keeping entailed thereby.

Co-operative workmen, and those working for a share of profits, rarely ask for a Monday holiday, as do most other workmen—thus their houses are able to execute orders with greater rapidity. When there was a strike amongst the painters the co-operative workmen at M. Leclaire's worked fourteen, and even more, hours per day without the slightest complaint.

COLONIAL AND INDIAN EXHIBITION.

THE BURMESE REGALIA FROM MANDALAY.—From King Theebaw's palace at Mandalay, a magnificent collection of jewellery and plate has been sent to England by the Viceroy, and it has been lent to the Exhibition by the Secretary of State for India. There are gold vases of different sizes, dishes of quaint shape, some in the form of a duck, betel boxes, reliquaries to hold the teeth of Buddha or other objects of veneration, jade ornaments, daggers and swords, dresses, hats, slippers, and a state umbrella; and, most noteworthy of all, drinking-cups with large cone-shaped covers which envelope the vessel; a gold bottle with a cray fish-shaped head, and King Theebaw's horoscope written on palm leaves. Most of these articles are heavily set with diamonds, rubies, emeralds, sapphires, pearls, and other precious stones. The collection has been placed in cases adjacent to the Ceylon Court.

THE PATENT OFFICE.

A PARLIAMENTARY paper has been issued containing the third report of the Comptroller-General of patents, designs, and trade-marks, with appendices, for the year 1885. From this report it would appear that, after making allowance for the large number of applications consequent upon the introduction of the new Patents Act in January 1884, the number of applications for patents during the year 1885 (16,101) shows that there was but little, if any, falling off in the number of inventions sought to be protected.

The following important provisions in favour of inventors were enacted by the Patents, &c., Amendment Act of 1885:—The requirement of a statutory declaration upon application was allowed to be dispensed with, and the Comptroller was empowered to grant extensions of time for filing and accepting complete specifications upon payment of an additional fee. The amending Act further provided that the specifications of applications for patents which had become void or had been abandoned should not be open to public inspection or be published by the Comptroller, thus removing a cause of possible litigation, besides effecting a large annual saving in the account for printing. It is noticeable that 79 per cent. of the total applications in 1884 were made from persons resident in the United Kingdom, and 77 per cent. in 1885. The number of applications communicated from abroad in 1884 amounted to 2,607,

Wholesale and Retail Depot:—London, 211 Regent Street, W.

BEAN'S PATENT DIRECT-ACTING VALVELESS WASTE-PREVENTING CISTERNS.

These Waste-Preventers are simple in construction and rapid and powerful in action. The working parts have been improved and are well balanced. The arrangements for charging the siphon are such that a slight pull by hand is all that is necessary to cause the immediate and automatic discharge of the contents of the Cistern.

THE CHIEF ADVANTAGES are—(1) the direct-acting method of charging the siphon, by which the full flush is obtained at once; (2) simplicity of construction; (3) no valve in the bottom of the cistern to cause leakage; (4) no tight-fitting parts to corrode or get out of order; (5) no waste incurred by fastening the "pull"; (6) insures a rapid and regulated flush without holding down the pull.

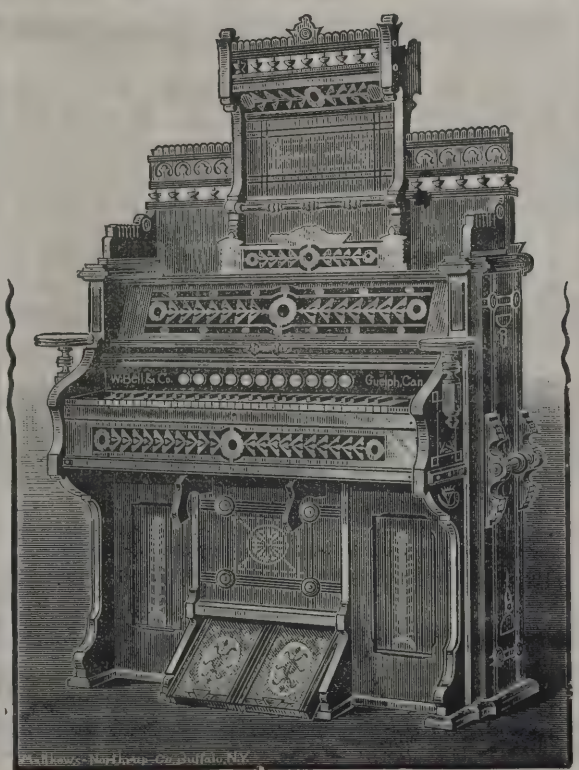
and in 1885 to 2,336. The largest number of applications on any one day in 1884 was 266 on January 1, and the smallest, 25, on September 26 in the same year; the corresponding numbers in 1885 were 109 on April 7 and 24 on August 17. The total number of applications, including communications from abroad—viz., 12,461 in 1884 and 11,695 in 1885, made through agents—amounted to about 73 per cent. in both years, the remainder, or 27 per cent., being made directly to the Patent Office by applicants themselves. In 1885 112 applications for amendment of specifications before the sealing of the patent and 61 applications for amendment after sealing were made at the Patent Office. Of these 173 applications 120 were allowed by the Comptroller, 13 were refused, 4 were withdrawn or abandoned, and 36 were not dealt with within the year. During the year 4,383 notices of similarity of inventions applied for were given in respect of 2,531 applications, and 49 applications previously included in prior applications were reported. About 120 under section 94 (which provides that a personal hearing shall be given to the applicant before refusal) were heard by the Comptroller.

The number of readers who frequented the library during the year 1885 was 44,176, against 39,508 in the previous year. The number of designs registered during the year amounted to 20,388, exclusive of 337 "sets" of designs. In the previous year 19,515 single designs and 238 "sets" were registered. The term "set" includes any number of articles ordinarily on sale together, irrespective of the varieties, of the size, or the arrangements in which the particular design may be shown on each separate article. The total number of applications for trade marks during the year (including 115 applications to the Cutlers' Company) was 8,026, as compared with 7,104 in the year 1884. The total receipts from various branches of the trade marks registry branch in the year 1885 amounted to 7,032*l.*

RAILWAY CONSTRUCTION IN AMERICA.

FROM a statement printed in the *Railroad Gazette*, it appears that up to the beginning of August 2,262 miles of new track had been laid down in the United States. This mileage is larger than that constructed in the corresponding period of any previous year since 1872, excepting the four years from 1880 to 1883. In 1873 the mileage to that date was 3,372; in 1880, it was 2,631; in 1881, 3,115; in 1882, 5,667; in 1883, 2,796. These figures have reference to main track only, and do not include additional tracks and sidings. Judging from the present great demand for rails in the United States, there must be a large amount of additional tracks and sidings in process of construction and in contemplation. The new main track reported up to the above date—2,262 miles—would require less than 225,000 tons of rails. Assuming that 5,000 miles of new main track will be laid during the whole of the year, the amount of rails required would be less than 500,000 tons. Deducting this from the estimated production (1,400,000 tons) of rails in the current year—an estimate based upon orders already executed and those still in hand—this leaves 900,000 tons for renewals, additional tracks, and sidings, or nearly three-fifths of the total production.



TECHNICAL EDUCATION IN INDIA.

THE following recommendations have been issued by the Home Department of the Government of India regarding the question of technical education :—

1. That inquiries be made whether it is not desirable that greater facilities for the study of law and medicine be provided in mofussil colleges in Madras and Bombay.
2. That the teaching staff of the Agra Medical School be strengthened, and the status of the school raised to an equality with that of Lahore.
3. That a medical school be established at Rangoon.
4. That the instruction in all medical schools be made more practical than at present.
5. That facilities for practical training be provided at the Rurki and Madras Civil Engineering Colleges.
6. That an art school on the Lahore plan be established at Agra.
7. That opportunity be taken where possible to establish agricultural and veterinary schools or classes in high schools.
8. That more attention be paid to the teaching of land surveying; and that the civil courts and other official bodies be required to employ certificated students of such schools in preference to non-certificated surveyors.
9. That instruction in drawing be made compulsory in all schools, the teachers of which are competent to instruct in drawing.
10. That competency to teach drawing be made as soon as possible an essential qualification in all teachers in middle and high schools.

11. That instruction in introductory science (the particular subjects of branches to be prescribed by the Education Department) be made compulsory in middle and high schools, similar provision being made as in the preceding head regarding teachers.

12. That examinations in middle schools include drawing and elementary science as compulsory subjects; and that a considerable latitude as to optional subjects of a practical character be allowed as in the Madras syllabus.

13. That the high school course be of two kinds :—

(*a*) Literary.

(*b*) Practical or "modern," as recommended by the Education Commission.

14. That to middle or high schools there be attached a technical branch, whenever inquiry brings to light the demand for technical training in any industry in the locality.

15. That such technical branch be an integral part of the provincial education system, subject to the control of the Education Department, and leading up to an examination to be instituted by the university.

16. That subject to the general supervision and control of the Department of Education, such technical schools be under the direction as to curriculum, &c., of the central art college, which should be affiliated to the university or engineering college of the province, as the case may be.

17. That the university establish two entrance examinations—one literary, at present; one "modern" as recommended by the Education Commission. The "modern" examination to include optional subjects to meet the requirements of Division A and Division B of paragraph 82 of this note.

18. That funds be provided for the promotion of the foregoing scheme by State grants when possible, and by appropriating some of the allotments now made to the support of higher English education, wherever this can be done without detriment to the interest of that education. That municipalities and local boards who are chargeable with the supports of education be also required to allot funds for technical schools, where the establishment of such be considered desirable.

The note concludes :—All has now been said which occurs to the writer to say in fulfilment of the Viceroy's commands. In conclusion, it may be observed that, although among the higher caste natives of India the obligations of caste still give a quasi-religious sanction to the distinction between the employments deemed menial and those deemed honourable, there are, nevertheless, indications that this sanction is losing something of its force, and that natives of all castes are in increasing number looking to technical education as affording an honourable livelihood and career in life. It is submitted that it is desirable to assist and encourage this popular feeling; that room exists for improvement in almost every department of technical instruction in India, and that the time is ripe not only for calling on local governments to take the matter up in earnest, but for indicating to them some of the directions in which improvement seems possible, and from which funds can be obtained for effecting it.

THE INSTITUTION OF CIVIL ENGINEERS.

As half a century has elapsed since the existence of the Institution of Civil Engineers was first announced to the world by the publication of its proceedings, the Council have considered it right to give a brief history of its career.

The honour of having originated the Institution is often assigned to Smeaton, or to Telford, but the idea is erroneous in both cases. Smeaton died many years before it was thought of, and Telford only joined it after its establishment.

A Society of Engineers, still existing, was founded by Smeaton in 1771. It includes many of the most eminent members of the profession; but it is rather of the nature of a social club than of a scientific association, and has no connection with this institution. It was, indeed, of too exclusive a nature to meet the wants of so large and mixed a body as soon became engaged in engineering, and early in the present century a feeling began to be entertained that an institution on a larger scale, having for its object the furtherance of professional knowledge, might be made eminently useful.

The persons who took the initiative in the matter were six young men, then beginning their engineering life—William Maudslay, Joshua Field, Henry Robinson Palmer, James Jones, Charles Collinge, and James Ashwell. Towards the end of the year 1817, they, impressed with the difficulties of gaining the knowledge necessary for the diversified practice of engineering, resolved to form a society for promoting regular intercourse between persons engaged in the profession, to the end that such persons might mutually benefit by the interchange of individual observation and experience.

The first formal meeting was held at the Kendal Coffee-house, in Fleet Street, on January 2, 1818. The proposal was favourably received. The Society was established. Other engineers joined, and rules were framed for its government. During two years it continued to meet, and the result of its experience of the value of the meetings was such as to warrant an effort being made to extend the limits of the Society. It was perceived that a principal step towards this extension would be to obtain the direct patronage of some eminent and popular professional man. Accordingly, on January 23, 1820, the following resolution was passed :—

"That in order to give effect to the principle of the Institution, and to render its advantages more general both to the members and the country at large, it is expedient to extend its provisions by the election of a President whose extensive practice as a civil engineer has gained him the first-rate celebrity;" . . . "and that a respectful communication be made to Thomas Telford, Esq., civil engineer, requesting him to patronise this Institution by taking upon himself the office of President."

So little was the Society known up to this time, that Telford had never heard of it when the foregoing resolution was announced to him; but appreciating, with characteristic judgment, the value of such an Institution, and the useful results it was capable of yielding, he accepted the proffered chair without hesitation, and was formally installed on March 21 following.

Telford's name gave an impulse to the progress of the Society, which grew rapidly in importance under his fostering care, until, on June 3, 1828, it received a charter of incorporation under the Great Seal, by the title of "The Institution of Civil Engineers." Telford died on September 2, 1834. A few years before his death he had begun to contract his engagements, and, as he gradually withdrew from the toils of business, his attention became more and more concentrated on this Society. It was, indeed, the last object of his solicitude, and gave employment to his mind in the evening of his days. Its collections were enriched by his bounty, and when, full of years and of honours, he felt the close of life approaching, he endowed the Institution with the munificent bequest which has since done so much to encourage the production of original communications for reading at the meetings and for publication in the "Minutes of Proceedings."

In 1835 the chair was taken, in succession to Mr. Telford, by another engineer of acknowledged eminence, Mr. James Walker.

In 1836 the first volume of the "Transactions" was published. It was a handsome quarto of 325 pages, illustrated by 28 elaborate engraved plates, and it contained 28 selected communications, for the most part of high character, and written by men of considerable eminence. There were also added copies of the charter and subsidiary regulations, with a list of members, and in the preface a short history was given. From the date in this volume the state of the Institution at that time can be correctly ascertained.

According to the "regulations," as they were then called, the Institution was declared to have been formed "for facilitating the acquirement of professional knowledge, and for promoting mechanical philosophy."

It consisted essentially of three classes :—

1. Members, being persons engaged in the practice of civil engineering (those who lived out of London being called corresponding members).

2. Associates, persons whose pursuits constituted branches of engineering, but who were not considered as engineers by profession.

3. Honorary members.

There were four vice-presidents :—William Cubitt, Bryan Donkin, Joshua Field, and Henry Robinson Palmer; and seven other members of Council, among whom were I. K. Brunel, Robert Stephenson, James Simpson, and John Macneill. The secretary was William Gittins.

The members were 140 in number, and among them are found the names of Bramah, Brunel (senr.), Tierney Clark, Gravatt, Penn, Perkins, Seaward, Vignoles, Bidder, Bodmer, Buck, Fairbairn, Grainger, Thos. E. Harrison, Hick, Leather, Leslie, Locke, Murray, Aaron Manby, Rastrick, Rendel, Sopwith, Smith of Deanston, the Stevensons of Edinburgh, Nicholas Wood, Arthur Woolf, and others well known in the profession. The Associates (many of whom afterwards became members) numbered 100, and the honorary members fourteen. The whole strength of the Institution was therefore 254.

In 1837 the publication of the smaller "Minutes of Proceedings" in octavo was commenced. This publication was at that time intended to give only abstracts of the papers and of the discussions (or, as they were then termed, "Conversations") that took place thereon. The papers themselves were submitted to the consideration of the Council, and a certain number were selected for publication in full in the quarto form.

In the report for 1837 (the first published) the Council dwelt with satisfaction on the increasing success of the Institution, and

And so on to any amount.

In the transaction of speculative business Messrs. C., S. & Co. make no charge for commission or brokerage whatever unless their client makes a profit, when they take 5 per cent. of the profit made as their remuneration.

All transactions advised by wire as soon as completed. Monthly Circulars and Mining Reports post-free on application.

COLES, STEWART & CO., St. Stephen's Chambers, LONDON, E.C.

expressed a hope that the profession generally would unite in advancing the objects which the original projectors had in view.

During this year Mr. Thomas Webster, M.A., a well-known barrister, was appointed to the office of secretary.

In the report for 1838 the Council gave an account of some important changes which had, during the session, been made in the by-laws and regulations, for the purpose of rendering them more definite and consistent with the charter. The qualifications of members and of Associates were modified, and the class of corresponding members was merged in that of ordinary members. A new class was formed under the name of "graduates"; these were young men in course of education as engineers, like the present "students," but, differing from the course subsequently pursued with the students, full corporate privileges were given to the graduates—a step which afterwards led to much inconvenience.

The composition of the governing body was also altered. It had hitherto consisted (including the president and four vice-presidents) of twelve councillors, chosen entirely from the class of members, but it was thought advisable to add two selected from the associate class, and one additional from the member class, making the total number fifteen.

In the same year a second volume of quarto "Transactions" appeared, on a similar scale to the first. It contained twenty selected papers, illustrated, as before, by thirty-three steel engravings.

The institution at first occupied rooms hired at 15 Buckingham Street, Adelphi. In 1834 a small house was taken at No. 1 Cannon Row, Westminster; but as the numbers increased the accommodation was found to be too limited. It was then attempted to obtain from the Government, as other scientific Societies had done, apartments in Somerset House, but fortunately this application was unsuccessful, and suitable premises had to be sought elsewhere. It happened just at this time that a house was found in perhaps the most appropriate situation that could have been selected, and at Christmas 1838 the Institution entered upon the premises it now occupies in Great George Street, where a meeting-room, about 30 feet square, was built in the rear of the front house. Although the expenses attending the change were, for the then moderate income, somewhat onerous, the difficulty was met by the members, who, when appealed to, answered the call very liberally.

In the session 1839-40 some further alterations were effected in the by-laws, the chief one being that the total number of the Council was increased to seventeen, of whom two were selected from the class of associates as before.

During this session there was an important change regarding the office of secretary. It appeared to the Council that the increasing business was such as to require the whole and undivided time and attention of a properly qualified gentleman to fill this position as a paid officer, and it was taken on this condition by Mr. Charles Manby, who entered upon the duties at Midsummer, 1839.

In 1842 a third quarto volume of "Transactions" was published, and this was the last that appeared. A fourth volume had been contemplated, but on account of the great cost attending this form of publication, the Council deemed it right to refer the subject to a Committee for consideration. The report of this Committee, mentioned in the Report of the Council for the session 1845, represented that the quarto form, with elaborate plates, was found, as it had been in other Societies, too expensive; that the selection of certain papers, to the exclusion of others, might be considered invidious; that the delay in the publication of the papers was prejudicial to the interests of the authors, and had prevented many valuable communications from being read at the meetings; and that the character of the quarto volumes prevented their circulation from being as extensive as was consistent with the objects of the Institution. These and other arguments appeared conclusive against the continuance of the double form of publication, and it was decided that from March 12, 1844, the papers should be published in octavo in full, or with only such curtailment as could be practised without injury to the authors' views, and that such illustrations should be given as were necessary. In this way the publication of the Minutes of Proceedings has been regularly continued, and they contain, in their long and ample series of volumes, now numbering eighty-four, a full account of the progress of the Institution, and of the matters which have engaged attention at the ordinary meetings.

At the end of the year 1844 an alteration was made which materially influenced the future of the Institution; this was a change in the duration of the presidentship. Mr. Walker had occupied the chair since the death of Telford, a term of ten years, and, although the regulations required annual election, there was an implied understanding that the appointment was a permanent one. It had, however, been forcibly represented to the Council that a shorter period for the tenure of the office of President and of the other posts in the Council would be advantageous. The question was fully discussed at a meeting

RUPTURES! RUPTURES!!

HARNESS' GOLD MEDAL ELECTROPATHIC XYLONITE TRUSS.

ADVICE FREE.

Price 21s. POST FREE.

Guaranteed to Last a Lifetime!

SELF-ADJUSTING, Light, Comfortable, Washable, Non-irritating. Can be worn by any person, under all circumstances, in any climate. Manufactured of the best Sheffield Steel, covered with XYLONITE (Flesh-coloured Artificial Ivory). It is absolutely free from Rubber, Leather, and other objectionable material, and is admitted by the most distinguished Surgeons to possess all the advantages and none of the disadvantages of every other Truss in the Market. PATIENTS SUFFERING from any form of Hernia are thus supplied with the *most perfect remedial appliances* at moderate prices. THE SKILLED ADVICE (free of charge) of a gentleman who has had *extensive experience* in the treatment of Hernia is at the disposal of those who can call at 52 Oxford Street, London, W.

ORDERS BY POST should state the nature of the displacement. Measurement required—circumference of the body one inch below the hips.

HARNESS' XYLONITE TRUSS.

Combines COMFORT, SUPPORT, ELEGANCE, AND CLEANLINESS.

RUPTURES! RUPTURES!

A NEW TRUSS—AN IMPORTANT INVENTION.—MR. C. B. HARNESS, the well-known Inventor of Electropathic Belts and other Curative Electrical Appliances, has lately introduced a new ELECTROPATHIC XYLONITE TRUSS, which has already been highly approved of and adopted by the highest Scientific and Medical authorities. It has a beautifully smooth, flesh-coloured surface of a washable and durable material. It is cheap, will last a lifetime, and the healing influences of its mild electric action renders it a boon to the afflicted patient. No sufferer should be without one of these *perfect trusses*. SKILLED ADVICE FREE OF CHARGE. Note address and call without delay on The MEDICAL BATTERY COMPANY (Limited), 52 OXFORD STREET, LONDON, W.

Note the Address:

THE MEDICAL BATTERY COMPANY, LD.

52 OXFORD STREET, LONDON, W.

on December 23, and, in consequence of resolutions then passed, a communication was addressed to Mr. Walker, which led to his objecting to be put in nomination again for the office of President. Notwithstanding this, however, at the annual general meeting on January 21, 1845, Mr. Walker was chosen; but on his declining to serve, the meeting was adjourned till the 27th, when Sir John Rennie was duly elected, taking his seat at the next ordinary meeting on February 4.

On January 6 and 27, 1846, special general meetings were held, at which the change regarding the presidentship was incorporated in the by-laws. It was enacted that in future no member should be nominated by the Council for election to the office of President more than two years consecutively, and that at the expiration of such two years he should not be re-eligible for three years.

At the same time the qualifications of candidates for admission were more accurately defined, those of members being made somewhat more strict, while those of associates were widened, so as to comprehend a larger range of individuals. The corporate privileges of the class of graduates were now curtailed. They were prohibited from voting at the election of the Council and officers, or from taking any share in the direction and control of the affairs of the Institution. In fact, it was virtually decided to allow this class gradually to become extinct; no other elections into it took place, and some years later the remaining graduates were transferred to other classes. It was arranged to admit young engineers as associates, from which class they could subsequently be transferred to the grade of members.

It had been found during this session that, owing to the increase in numbers, and to the consequent larger attendance at the meetings, the accommodation was insufficient. On July 28, 1846, a special general meeting was held to consider some plan of meeting the difficulty. A report of the Council having been read and discussed, inquiries were ordered to be set on foot to obtain a site on which to erect a building suitable for the wants of the Society. At an adjourned meeting, held on August 11, a second report of the Council was received. It stated the impossibility of finding a piece of ground possessing the advantages of the present situation, except on terms which it would be unwise to entertain. It was, therefore, decided to enlarge the meeting-room, and to make such other alterations in the existing building as should render it more convenient for the purposes of the Institution. These works were carried out during the recess, at a cost of 4,350*l.* To meet this outlay, it was arranged that every member should subscribe 7*l.* 7*s.*, and every associate 4*l.* 4*s.*, and that new members and associates should enter into an obligation to contribute like sums to form a "Building Fund" for defraying future expenses of the same kind. In the meantime debenture bonds of 100*l.* each were issued to the extent of 2,500*l.*, to provide for the immediate requirements. Some of these bonds were afterwards voluntarily cancelled, and in other cases the holders, or their nominees, were placed on the books as life subscribers, in consideration of their surrender, so that in one way or other the whole of the bonds have disappeared.

A special general meeting was held on May 3, 1855, in compliance with a formal requisition, to consider propositions for making certain changes in the constitution of the Council, such as causing a certain number of the members of Council to retire every second year. But after full discussion these propositions were withdrawn.

In June 1856 Mr. Manby, who had held the post of secretary for seventeen years, tendered his resignation, having accepted a professional engagement which prevented his devoting the necessary attention to the work of the office. He agreed, however, to continue to act gratuitously, and subsequently was appointed honorary secretary, a position he held till his death, on July 31, 1884. The present secretary, Mr. James Forrest (who had been for fourteen years more or less intimately connected with the Institution, in which he was to some extent brought up), was appointed assistant secretary at Midsummer 1856, his position being changed to that of secretary on January 3, 1860.

In the course of 1866 the Council was led to consider the possibility of allowing engineering students to benefit by access to the Institution, a subject which had been in abeyance since the virtual abandonment of the class of graduates in 1846. The Council thought that the object might be accomplished by the establishment of a class similar to the former graduates', but with certain modifications; and brought the subject before a special general meeting with a view to the necessary provisions being made in the by-laws. This meeting was held on June 26, 1867, when the proposed alterations were passed, the essence of the provisions being that the members of the new class, though attached to the Institution and enjoying many special privileges, should have no corporate rights, and should only be admitted by, and remain students during the pleasure of, the Council. The class was accordingly constituted, and, under the arrangements adopted, has been entirely successful.

BRYANT, POWIS & BRYANT
LIMITED,

"THE PEDESTAL VASE,"

JENNINGS' IMPROVED W.C. APPARATUS

(Combination Urinal and Slop Sink).

Registered No. 16,300.

A PORCELAIN VASE set on a tiled or mosaic floor, within walls or a dado of glazed tiles. The usual wood framing, forming a storehouse for the retention and accumulation of *damp*, *dirt*, and *disease germs*, with the joints, crevices, and imperfections in work which the closet enclosure so often conceals, is entirely abolished. The seat is hinged, permitting free access for use as a *slop sink* or *urinal*, and for cleansing, so that the entire apparatus and space can be freely washed down. For this latter purpose the floor should be slightly sunk, and laid to fall to a grating, with waste carried through the external wall, and terminating in a copper flap valve to prevent draught.

☞ The suggestions as regards wall linings and floor, may, of course, be modified as best adapted to the building in which the closets are used; and in the consideration of such details, alternative schemes will readily present themselves.

At the recent **HEALTH EXHIBITION** (South Kensington, 1884), amongst a series of official tests, under the supervision of Baldwin Latham, Esq., C.E., and the Jury No. 9, Class XXIII., and successfully withstood by this closet, the following may be cited in evidence of its efficient action. Being fixed in position shown in illustration, with **"JENNINGS' PATENT SINGLE FLUSH WASTE-PREVENTING SYPHON CISTERN"** 5 feet over, with 1¼ inch down pipe, ten apples (averaging 1¼ inch diameter) and a flat sponge about 4½ inch diameter were thrown into the basin. The water, as well as the whole of the exposed or dry surface, was first blackened with plumber's "smudge," and the sides covered by four pieces of thin sanitary paper, which adhered closely to the soiled surface. The handle of the cistern was then pulled, and the two-gallon flush liberated. After seven seconds (the time occupied by the discharge), a receiver placed under the trap outlet was removed, containing in the blackened water **the ten apples, the sponge, and the four pieces of paper,** no traces of the soil remaining visible upon any part of the apparatus.

GOLD MEDAL AWARDED.

THESE CLOSETS are already in use in Hospitals, Banks, Hotels, Offices, Private Residences, &c., with most satisfactory results, and, fixed in the manner described, in appearance and action leave nothing to be desired. By the novel arrangement of the supply to Basin, as shown in the sectional sketch annexed, the whole surface is well flushed and cleansed, whilst the bottom of Basin and Trap are thoroughly scoured by a concentrated rush of water which insures the **instantaneous removal** of the contents, thus overcoming the inherent defects in the many imitations recently produced of **"JENNINGS' MONKEY-CLOSET"** (the **original form of wash-out watercloset**), which was invented and patented by G. J. in 1852.

TESTIMONIAL.
BANGOR, N. Wales: September 14, 1885.
Sirs,—I have pleasure in testifying that I have used Leggott's Sight Adjustments for various buildings to high skylights, fanlights, and top parts of windows, and in every case they gave satisfaction.
They are secure in whatever position, whether the window is open or closed, and are quite simple and workable in their action. I prefer them to any other that I have seen or used for the above-mentioned purposes.—I remain, yours obediently, R. DAVIES, Architect.
Messrs. W. & R. LEGGOTT, Bradford.

FLAT BRICK FIRE-PROOF FLOORS.

LONDON, 1874.

LONGITUDINAL SECTION.

BRUSSELS, 1876.

THE BEST as well as the CHEAPEST Fire-proof Floors yet introduced. Their small cost makes them specially suitable for artisans dwellings, residential flats, offices, chambers, and private houses.

They are constructed with hard-burnt bricks, laid flat, and bonded on the upper face with tough concrete 3 inches thick; and by the method of laying all iron is protected from the action of fire.

Experiments show a resistance to load and impact greater than furnished by the ordinary concrete floors. No thrust is transmitted to the walls, as in all arched construction, the walls being tied in and strengthened.

The floors are practically noiseless, the different densities of the concrete, brick and plaster, with the air space above, intercepting the sound vibrations.

The brick soffit forms a capital key for the plaster, and no laths or counterceiling are necessary, but for high-class work wood blocks are introduced in the soffit, to which the ordinary lath and plastering or fibrous plaster is fixed. This also provides a second air space, and furnishes the most perfect sound-resisting floors known.

They are not affected by water, acids, or alkalies, and they may be fixed during the progress of the building, thus dispensing with the use of internal scaffolding.

The concrete being tough instead of friable, the boarded finish may be nailed down without the use of sleeper joists. It is recommended to use an inch strip as a sleeper fillet. This will provide ventilation, and space for gas and water-pipes.

The depth of the finished floor is 6 to 9 inches only, and when the saving on this head is taken into account, the cost does not exceed that of the ordinary combustible timber floor of corresponding strength.

FOR TONE, TOUCH, GENERAL FINISH, AND GOOD VALUE.

Wholesale and Retail Depot :—London, **211** Regent Street, W.

The Celebrated "DUBOIS" Hydraulic Drawn Lead TRAPS and BENDS.

The above Shapes and Sizes always in Stock, and we are prepared to furnish SPECIAL SHAPES to order at short notice. These justly celebrated TRAPS are made from Pure Pig Lead by Hydraulic Machinery after the manner of Lead Pipe, and have peculiar advantages appreciated by every Plumber. They are greatly superior to either Cast or Hand-made Traps, as they have no SEAM, are of UNIFORM THICKNESS, PERFECTLY SMOOTH INSIDE AND OUTSIDE, and can be FLANGED, PLUGGED, and STRETCHED, without fear of SPLITTING. No possibility of Sandholes.

FOR PERFECTION OF MANUFACTURE THESE GOODS ARE PRE-EMINENT.

For Sale generally by the principal Lead Merchants and Wholesale Dealers in Plumbing and Sanitary Appliances throughout Great Britain and Ireland.

NOTES ON NOVELTIES.

Faija's Patent Cement Testing Machine.—The object of testing cement is to determine, in a short time, its quality and the results which may be expected from its use in practice. For this purpose it is necessary to use an apparatus called a cement tester. The action of this cement tester is based on the principle, which has been proved by practice, that moist heat accelerates the setting of cement, and that if judiciously applied the age of several days may be artificially given to a cement in a few hours. A sound cement acquires great hardness in a short time when treated in this apparatus, but an unsound one, or one that would under ordinary conditions "blow" when used in work, is caused to develop this characteristic in a few hours; and hence, by the use of this apparatus, a definite opinion may be formed as to whether or no a cement is a safe one to use, independently, of course, of its tensile strength, which may or may not be equal to that required. Messrs. Bowes, Scott & Read, of Broadway Chambers, Westminster, are the sole licensees and manufacturers of the above patent, which has been proved to be one of the best on the English market.

TRADE NOTES.

THE American Elevator Company, of 38 Old Jewry, London, have received an order to fix at the new National Liberal Club on the Embankment, which is being erected from the designs of Mr. A. Waterhouse, R.A., an elaborate lift service. Three of their Standard hydraulic elevators will be employed. The type selected is the same as that adopted in the Northumberland Avenue Hotel and the Albert Hall Mansions. In the former there are four of these elevators, and in the latter six. The method of working is the same in all, viz. by low pressure derived from tanks on the roof, into which the water is pumped from tanks of similar capacity in the basement. This reduces the working cost of the elevators to the simple cost of pumping. One of the elevators in the National Liberal Club is to rise 112 feet 6 inches, another 100 feet, and the third about 49 feet. In the Northumberland Avenue Hotel the rise of one is 91 feet 6 inches, of another 88 feet, and the two remaining 78 feet each. In the Albert Hall Mansions one elevator rises 102 feet 4 inches, another 92 feet, and the other four about 60 feet each.

MESSRS. BRADLEY & CRAVEN, of Wakefield, a leading firm in brick-making machinery, inform us that they are making bricks from a fine bed of clay near their works. Two of their own machines are in constant working, and the bricks have a particular density and hardness. Excellent railway facilities are at hand for supplying any part of the country.

A VERY handsome pair of polished brass sanctuary standard lights have just been executed for St. Michael's Church, Headingley, near Leeds, by Messrs. White & Sons, metal-workers, of 207 Oxford Street, London. This firm likewise made the brass altar rails and iron chancel gate for the same church.

THE master plasterers of Edinburgh and Leith, on Tuesday, agreed to grant an application by the men for an advance of a halfpenny per hour in their wages.

THE horses belonging to the Corporation of Edinburgh have this year been valued by Mr. John Waddell, contractor, at 6,720*l.* for 108 head, being an average of 62*l.* 4*s.* each, as compared with an average last year of 59*l.* 2*s.* for 105 horses.

MR. ALEXANDER MILLER, who obtained the mason work of the new town hall, Helensburgh, having withdrawn from the contract after signing agreement and commencing operations, the Hall Committee have accepted the offer of Mr. John Jack, Helensburgh, to complete the masonry for 1,959*l.*, or a sum of 83*l.* 10*s.* over Mr. Miller's original estimate. Mr. Jack will at once proceed with the work. The joiner's estimate has not yet been decided.

THE ANDERSTON FOUNDRY COMPANY (Limited), Glasgow, has just tested some glass railway sleepers for Dr. Siemens, of Messrs. Siemens & Halske, of London and Berlin, who has long been engaged in the development of that article. It is stated that the result of the experiments has been of a satisfactory character.

ARTISTIC SANITARY WALL-HANGINGS.

DURO-TEXTILE, Combines all the artistic and hygienic effects of a Painted Wall, at a great saving in cost. Can be SCRUBBED with Soap and Water any number of times without injury.

MURALINE, a highly-finished artistic washable Wall Paper, in beautiful designs and colourings.

EMBOSSED TAPESTRY, a high-class Wall-Hanging, fitted for superior Decorations, made in the most striking effects.

Patterns are kept by all Decorators and Upholsterers, or will be sent on application to

FISHER & CO., 33 SOUTHAMPTON ST., STRAND, LONDON, W.C.
WORKS:—LOUGHBOROUGH JUNCTION, S.E.

COLES, STEWART & CO.,
STOCK AND SHARE BROKERS.

Messrs. COLES, STEWART & CO. undertake every description of Stock Exchange business, and have special and early information on all leading Stocks; they are also continually advised by telegram from the chief Mining centres, both at home and abroad. For Investment Messrs. C., S. & Co. make only one charge of $\frac{1}{16}$ per cent. commission on all descriptions of Stocks, and open Speculative accounts with from 1 per cent. cover and upwards, without any further risk or liability to their clients whatever.

THUS, £5 commands £500 Stock; £10, £1,000 Stock; £50, £5,000 Stock;
And so on to any amount.

In the transaction of speculative business Messrs. C., S. & Co. make no charge for commission or brokerage whatever unless their client makes a profit, when they take 5 per cent. of the profit made as their remuneration.

All transactions advised by wire as soon as completed. Monthly Circulars and Mining Reports post-free on application.

COLES, STEWART & CO., St. Stephen's Chambers, LONDON, E.C.

At the meeting of the Executive Committee of the Jubilee Exhibition, Manchester, on Wednesday, an offer from Messrs. John Galloway & Sons to supply, free of cost, the whole of the boilers, with their necessary valves, required for the exhibition, was accepted. An offer by Messrs. W. H. Bailey & Co., to supply all turnstiles required for the entrances, together with the necessary fittings, free of cost, was also accepted.

After severe testing of stoves for the warming of the Bank of England, the Honourable Governors, with their architect, have decided to warm it by means of Shorland's patent Manchester stoves, which they have found eminently satisfactory at the Bank and its branches throughout the country.

Messrs. Wheatley, Kirk, Price & Goulty, electrical and mechanical auctioneers, Queen Victoria Street, E.C., will on Thursday, the 7th inst., sell by auction all the modern brick-making plant, boilers, engines, shafting, gearing, &c., at the Milton Church Brick Fields, near Sittingbourne, Kent.

THE PRINCESS'S THEATRE, EDINBURGH.

An application was made last week to the justices for a renewal of license for the Royal Princess's Theatre, Edinburgh. The magistrates had ordered a report to be prepared by the Burgh Engineer and Firemaster, which was laid before the court on the same occasion. The report referred at the outset to the outcome of a similar report on the same premises submitted to the justices in 1883. In that report a number of vital defects were described in detail, and recommendations made for a thorough overhaul of the premises. The reporters found that while a few of these recommendations had received attention, the most important had not; and, with the exception of the removal of inflammable materials in the form of lumber of disused scenic furnishings, five direct points of danger within the main structure, the building up of a window in Nicolson Street towards a tenement which was in dangerous contiguity with the theatre roof, it was difficult to say that the condition of the theatre was much, if at all, better than at the time of the previous report. Proceeding to deal with the condition of the theatre in detail, the report referred in the first place to its situation, which, for a much-frequented place of entertainment, it considered most unsuitable, in respect that it occupied a site immediately behind tenements of dwelling-houses forming the southern corner of Nicolson Street and Hill Place, its accesses passing directly underneath the dwelling-houses in Hill Place on the one hand, and traversing a long narrow passage between the Nicolson Street tenements on the other. Besides, a number of the lumber cellars and property rooms penetrated directly underneath Hill Place property, so that in respect of the two essentials of access and isolation the theatre laboured under serious disqualification. The report next dealt with the arrangements and accommodation of the theatre, pointing out that there was no fireproof separation between stage and auditorium. The chief agent in promoting exhaust ventilation was a central sunlight, vitiated air escaping through a louvred ventilator in the roof. There were also numerous openings in the roof at other points, which were, however, at present covered with canvas to prevent smoke or sparks from the outside gaining access. The fresh supply was nowhere provided for except at these openings. The floor and subsoil were damp, and, with the large number of gaslights burning, the atmosphere, in a full house, became in a short time vitiated and impure. The only sanitary convenience was a single water-closet, in a dilapidated state, inconveniently situated. Dealing with the means of egress, the report stated that each section of the auditorium had its own egress, but the dress circle, the orchestra, and pit stalls, which used jointly the exit to Nicolson Street. The ratio of exit space to a full house was one foot to eighty-two persons; the report considered the ratio should not be greater than one foot to fifty persons. The main exit to Nicolson Street was 24 yards long, with the ceiling lined with canvas in close proximity to the gaslights, the only protection being a glass shade. At the end of the passage was a number of steps, which in the event of a panic would be a treacherous source of danger. Across the gallery seats were stretched a number of iron rods intended as a support for the back, which in the event of a panic would also prove a source of danger. The condition of the property and dressing-rooms was described as very unsatisfactory, several of the former under the Hill Place tenements being stored with inflammable materials. The lime-light tanks were said to be placed in a wooden enclosure in the "flies" over the stage. In most well-ordered theatres, the report stated, these were very properly placed in a fireproof chamber outside the theatre. In the present case the enclosure was of combustible material and seriously out of repair. In concluding, the reporters stated that, as the recommendations made in a former report had been in the main disregarded, they considered themselves shut up to the necessity of recom-

mending that, under existing circumstances, the Royal Princess's Theatre should not be licensed.

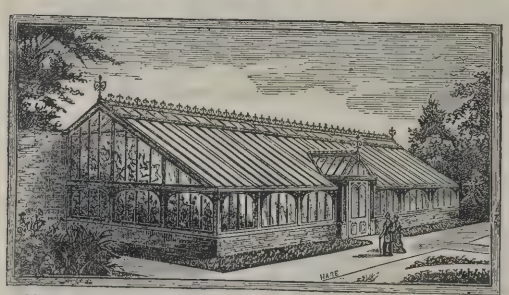
A discussion followed. The Dean of Guild proposed that the subject should be postponed until the Dean of Guild Court should have the place inspected, while the Lord Provost advocated that a license should not be granted, as the building was not in a proper place for a theatre. On a division, there were nineteen votes for delay and twelve for refusal.

THE HALL, BUSHEY.

THIS magnificent mansion, formerly the residence of the late Mr. E. Marjoribanks, who built it at a lavish outlay for his own occupation, has lately been converted into a hydropathic hotel and health resort. Standing in one of the most beautiful parts of the picturesque county of Hertfordshire, about one mile from the Bushey and Watford stations of the London and North-Western Railway, it has become a very favourite resort, being in immediate telephonic communication with London. The mansion is luxuriously furnished and decorated, the comfort and health of the guests being well cared for by its courteous and agreeable medical superintendent, Dr. Banning.

To add to the pleasure of a stay in this charmingly situated hotel, the managers have recently introduced the electric light, the installation having been carried out by Mr. Henry J. Rogers, M.I.M.E., of the Watford Engineering Works, Watford. It is an extremely soft and brilliant light, the artistic decorations of the rooms and passages being preserved in their original purity of design.

The dynamo is driven by the engine, which is also used for the laundry machinery, and requires no electrician, but only the ordinary stoker. Close to the dynamo is a fuse and cut-out which would effectually prevent an accident happening from short circuit. The lights are run from the dynamo direct, and we must remark that they were perfectly steady. By this means the cost to charge and maintain batteries is dispensed with, consequently it appears that we are nearing the stage when the electric light will be within the reach of the upper and middle classes. The lamps have been attached to the gas-fittings, none of which have been removed, and yet not a single black wire is visible in any part of the ceilings or walls. Yellow silk wires have been passed down the chandeliers, so as to harmonise exactly with the fittings themselves, the lamps being mounted on effective white Venetian shades, and attached by lacquered brass clips to the arms of the chandeliers. We believe the whole cost of the installation did not exceed 300*l.*



THE EGYPTIAN OBELISK IN NEW YORK.

A RECENT examination shows that the obelisk in the Central Park is not so thoroughly protected as many supposed it would be by the hot paraffin treatment last fall. The *Scientific American* says the process consists in heating the stone and applying a mixture of paraffin, creosote, and turpentine. Previous to this the stone had been carefully gone over, and pieces supposed to be loose, on testing with a hammer, or where there were cracks, were removed. It now appears that the stone is again in some places flaking off or showing slight signs of slow disintegration, although such action is only perceptible on careful examination. It is said to be the result of an insufficient trimming off of the surface of the stone, to remove imperfections before the paraffin was applied; others attribute the result to the application of heat to the stone before putting on the paraffin. It has been decided best to do nothing further in the matter at present, until it is shown to what degree the preservative process will be actually effective for a longer period, although in the end it may be necessary to enclose the stone by building a light glass structure around it.

THE POSITION OF SUB-CONTRACTORS.

A CURIOUS case was tried in the Conway County Court a few days ago. The plaintiff, William Pritchard, plasterer, Augusta Street, Llandudno, sued Evan Williams, contractor, Bangor, for 50*l.* damages for alleged breach of contract. The action arose in connection with a contract for additions to the Llandudno Market Hall, executed by the defendant. He invited tenders for plastering, slating, and cementing. The plaintiff tendered to do the work for 51*l.* 13*s.*, and this tender was accepted. The plaintiff commenced work, but after being engaged upon it for about four days he received a letter from the defendant stating that he would not be allowed to proceed, as the architect, Mr. E. Turner, who had power by the original contract to turn anyone from the work, objected to the plaintiff. From the evidence adduced it appeared that the

plaintiff had had a quarrel with Mr. Turner, and pinned him to the wall, and Mr. Turner in return locked plaintiff in his office. The plaintiff was asked to apologise, but he declined, and said he would sooner see Mr. Turner in his grave. It was argued for defendant that the suppression of the fact from the defendant that there existed a bad feeling between the plaintiff and the architect justified the defendant in putting an end to the contract. The defendant in his evidence stated that when he told the plaintiff that Mr. Turner objected to him, the former said he did not expect anything else, as he had done the same thing twice before. Subsequently His Honour gave judgment for plaintiff, with nominal damages of 1*l.*

COLONIAL AND INDIAN EXHIBITION.

One of the most important features of the exhibition has been the excellent fire-extinguishing arrangements provided under the superintendence of General Festing and Mr. J. H. Cundall, the electric light engineer.

To give the Colonial visitors a practical illustration of the power available for the protection of their valuable exhibits, a special display of the steam fire-engines took place yesterday (Wednesday) morning, when, notwithstanding the early hour, nine o'clock, a number of the Colonial and other gentlemen interested in the exhibition were present, amongst whom were Sir Saul Samuel, Sir G. N. Chambers, Sir J. Rose, Lieutenant-Colonel Palmer, Mr. Scott (representing Sir Samuel Davenport), Mr. A. F. Thomson (Western Australian Commission), Mr. W. E. Davidson (Ceylon Commission), Mr. C. H. Fishbourne (Hong Kong Commission), &c., &c. The first engine to be tested was one of Messrs. Shand, Mason & Co.'s Metropolitan pattern engines, part of an equipment of three constructed for the Fire Insurance Companies' Brigade, Melbourne. Steam was raised in wonderfully quick time, and the engine threw first one 1½-inch jet to a height of about 160 feet, this being replaced by two and subsequently four jets. The ease with which the engine could be managed, and its adaptability for Colonial use was clearly demonstrated by the various experiments. Another and more powerful engine by Messrs. Shand, Mason & Co. was then set to work. Eight minutes only were taken in obtaining the full working pressure of 100 lbs. steam, when an enormous volume of water issued from a 1½-inch jet, at the rate of 900 gallons per minute, and rising to a height of over 200 feet. Four 1-inch jets were subsequently brought into play with equally good results, and the experiments, which were considered exceedingly successful, were brought to a close at half-past ten.

THE CRERAE QUARRY ACCIDENT.

On Saturday a lamentable accident, of an almost unprecedented description, occurred at the Crerae Quarries, on Loch Fyne, near Inverary. The Corporation of Glasgow obtain stone from the quarries, and once a year it is customary for a party of officials, their friends, and others, to visit the place, and witness a blast on a large scale. On Saturday 50,000 tons of rock were to be displaced. There was the additional interest of the occasion being a jubilee celebration of the Statute Labour Committee. The steamer with the party arrived off the quarries shortly after one o'clock, and was brought up a little within a mile from the shore. As on former occasions, the signal for the explosion to take place was given by the steamer sounding her steam whistle. The charge was immediately fired, and in less than a minute the whole face of the quarry heaved outwards, between 60,000 and 70,000 tons of rock being dislodged, and the operation proving very successful, as far as the purpose for which it was intended is concerned. The smoke having somewhat cleared away, the steamer was taken a little nearer the shore, and those of the passengers who desired to do so were allowed to land in boats for the purpose of examining the results of the blast. About three hundred persons, many of them ladies, availed themselves of the opportunity, and were landed on the beach. The steamer then continued her run to Inverary, the arrangement being that she should pick up those who had gone ashore on the return journey. When the company assembled on the beach they immediately proceeded to the quarry, accompanied by Messrs. Alexander and John Faill, the lessees, Mr. Sharp, the manager, and Mr. William Sim, the proprietor, these gentlemen explaining to various groups of ladies and gentlemen the nature and extent of the operations carried on at Crerae, and the blasting processes by which the rock was obtained. In this way the visitors entered the quarry—which, it should be explained, takes in the interior the shape of a horseshoe—and there was nothing, so far, to indicate that they were incurring the smallest possible risk. Before many minutes had elapsed, however, many members of the party, at all points, seemed suddenly, and in the midst of animated conversation, to be overpowered by some invisible vapour, and fell motionless to

FRENCH LIBRARY OF ART.

JUST PUBLISHED. Handsomely bound in Cloth, Broché, 24*s.*; Relié, 28*s.*

LES STYLES.

OVER SEVEN HUNDRED ENGRAVINGS OF DIFFERENT PERIODS, WITH DESCRIPTIONS.

BY PAUL ROUAIX.

"This large and sumptuous book is issued by the publishers of *L'Art*, a journal which we have frequently referred to as being one of the best publications of its kind in Europe. The French Librairie de l'Art has been known for long in connection with works treating of the fine arts, and *Les Styles* is certainly equal to anything we have ever seen of the kind, and by far superior to the vast majority of similar works issued in this country. There is something about the atmosphere of France which confers refinement of taste in everything relating to designs, and so pronounced is the national aptitude for discovering beauty and symmetry, that the very fact of a book coming from across the straits is generally a sufficient guarantee of the artistic excellence of the contents.

"M. Rouaix treats of many species of decoration, commencing with that in vogue amongst the ancient Egyptians, and proceeding in regular order of date with the Etruscan, Greek, Byzantine, Roman, Gothic, the peculiar ornamentation of the Renaissance, and of the times of Louis XIII., XIV., XV., and XVI. Before each division the author introduces a short historical introduction, and afterwards, by means of a series of beautifully executed prints, illustrates the prevailing fashion of the time. For this purpose he has levied contributions on examples of architecture, carving on wood, suits of armour, bas-reliefs, tapestry and embroidery, mural painting, mosaical work, and a host of other subjects, including caskets and chalices. In fact, anything that can be called artistic and assigned with certainty to a particular era is represented, the result being an exhaustive and exceedingly pretty production."—Book Lore.

the ground among the stones. The officials, at once realising that the catastrophe was due to choke-damp, called out to the people to run, but in the consternation with which everyone was more or less seized the warning was either not understood by many or they found themselves powerless to act upon it. For some minutes persons continued to fall, most of them without even uttering a word or a cry, and to lie upon the ground to all appearances dead. In this way it is said that in the course of a few minutes no fewer than from eighty to one hundred persons were prostrated. Eight men were killed and a large number injured.

The history of the Crerae Quarry at Furnace, and of the blasting operations there, is closely connected with the efforts made by the Glasgow Police and Statute Labour Committee during the last half century to improve the causewaying and paving of the city streets. When the management of the streets was transferred in 1836 from the old Statute Labour Trust to the Board of Police, the thoroughfares of the city were in a miserable state of repair, and all laid with "common rubble causeway." The contractor for the cleansing and lighting of the city was Mr. William Sim, who at once entered with energy into plans for realising the desire of the Committee to improve the system of street paving. The success of these plans is described in a memorandum prepared by Mr. Sim for the occasion of the large blast of Saturday, which was fired in honour of the Statute Labour Committee's jubilee, accompanying which memorandum is a statement by Messrs. William Sim & Co., the lessees of the quarries, containing particulars of the blast and elevations of the quarry face. The first paving experiments were made with blocks of square-dressed whinstone, for obtaining which quarries were opened at Kilsyth; but the results, as indicated in the paving of Jamaica Street, were disappointing, the blocks being found pitted and full of holes after being down only three years. The late Mr. David Lyon was acting manager for Mr. Gibb, contractor for the building of Glasgow Bridge, and he afterwards contracted for the building of a quay at Inverary, and was permitted to quarry a portion of the materials from the rocks at Furnace, some ten miles to the south, and on the western shore of Loch Fyne. Soon after the Committee took over the streets management several hundreds of tons of dressed granite causeway stones from Furnace were used in paving a portion of Jamaica Street, and in 1840 this was found to be in excellent condition, the stones being in such good preservation as still to show the marks of the tools used in preparing them. The result was to convince the committee of the necessity of substituting granite for whinstone in street paving; and in 1841 permission was obtained from the father of the present Duke of Argyll to open a quarry at Furnace, and a contract entered into to supply a thousand tons for the paving of High Street. From that date the operations for the quarrying of the grey granite of Furnace have gone on in an extending scale, so that the great bulk of the stones employed in paving the existing city streets has come from this source. In 1852 the first "great blast" took place, and was attended with such satisfactory results that the system has since been regularly continued, ten "blasts" having been fired up to the year 1855. The great blast fired on Saturday was, as has been stated, designed to be a celebration of the completion of the fifty years' labours of the Statute Labour Committee, and elaborate arrangements had been made in connection with it for the success of the operation, and for the safety of life and property. It was to be fired, as the official statement says, "immediately on the arrival of the Lord of the Isles at a safe distance within view of the quarry face. The gunpowder in the chambers will as usual be exploded simultaneously by means of electricity from a battery technically called an exploder. The captain of the Lord of the Isles will sound a steam whistle as a signal to the operators, and in less than a minute, if all goes well, the blast will be over." As the plans show, the "bull's eye," or mouth of the entrance mine, was situated 30 feet above the floor of the quarry, and from it to the top of the perpendicular face was other 60 feet of rock. Upwards from this, however, the rock had a receding rise to a considerable height, so that in vertical line from the mines and chambers to the flagstaff overhead there was in all 100 feet of super-imposed rock. The entrance mine extended backwards for 60 feet, and then divided, sending off at an obtuse angle, for other 20 feet, galleries to the right and left, each ending in a powder chamber. Between each chamber and the face of the quarry there was a depth of 70 feet of rock, and in each was contained 7,000 lbs. of powder — in all, 14,000 lbs., equal, according to the standard by which gunpowder is sold, to 7 tons. The working dimensions of the blast, from the western to the eastern dividing joint, was in width 100 feet, and taking the height as we have described it at 100 feet, and the thickness at 70 feet, there were 25,925 cubic yards of rock to be displaced, requiring, at 2 tons per yard, an expenditure of force equal to 51,850 tons. The expectation, however, of the contractors, fully borne out by the results, was that if the blast

NO MORE BLACKENED CEILINGS.

With Corona. Without Corona.

SPENCER CORONA

Fitting closely on the top of ordinary Gas Globes, forming a PERFECT REGULATOR.

Absolutely consumes all smoke. Officially proved to save 25 to 30 per cent. in Gas. Increases the light, renders the atmosphere purer, prevents tarnishing of gilding, and lessens the danger of fire.

The difference in the amount of light given by a gas flame when the Spencer Corona is placed on the ordinary open globe is instantaneous and surprising. The flame flattens out, the blue part becomes smaller, and the white is intensified in brightness. No one can realise the results obtained from the Spencer Corona unless he sees it in operation.

All former types of Coronas have only dispersed the carbon about the room, and prevented it forming one black spot immediately above the flame. The Spencer Corona is the only one which absolutely consumes the carbon.

worked successfully a large number of tons additional would be removed by natural falls of the rock occasioned by the disturbing action of the explosion. As has been said, the blast was believed to be a great success by those who had charge of it. The great mass of rocks was torn to fragments by the explosion, and the belief was entertained that a greater fall than they had anticipated had been realised. Of course, the distressing nature of the subsequent proceedings naturally prevented the inspection necessary to verify the opinions formed. It may be mentioned that the blasting was carried out under the direction of Mr. Adam Sharp, the manager, and Mr. John Jardine, the engineer of the quarry.

THE WATER SUPPLY OF KIDDERMINSTER.

On Monday the new high-level reservoir, which has been constructed at Kidderminster with the object of improving the water supply of that borough, was opened, when the ceremony of turning the water into the mains was performed by Councillor Potter, the chairman of the Drainage Waterworks Committee. Two years ago a preliminary report was drawn up for the Council by Mr. E. Pritchard, C.E., and Mr. A. Comber, borough engineer, recommending, among other sanitary improvements in the borough, the construction of a reservoir on the plan now carried out. The report was followed up by a more detailed and exhaustive one at a later date, in which they pointed out that many defects existed in both water and sewerage, although the existing works had been only constructed comparatively a few years at an outlay of some 126,000*l*. In the report referred to, the construction of a high-level reservoir was strongly recommended. The site of the reservoir is a portion of the high land known as Sutton Farms, on the Bewdley Road, and it is some 1,100 yards distant from the waterworks pumping station on the Stourport Road. This land is the highest available site near Kidderminster, and will permit of forty-three feet greater head of water than could have been obtained from the existing open reservoir near the pumping station. The new reservoir is a covered one, and is constructed of masonry, brickwork in cement and concrete, and is partly in excavation and partly in embankment. Special care has been taken by puddling all portions of the work below the top water level, as the ground upon which it has been constructed contains a porous subsoil. The interior of the reservoir has the following dimensions (being square on the plan) :—145 feet long, 145 feet wide, with an available height for water of 14 feet 7 inches. The capacity, after making deductions for pillars and buttresses, will provide a storage of 1,850,000 gallons. The roof of the reservoir is constructed of a rolled iron girder floor and with cement concrete arches, upon which is placed some two feet of earth, the whole being supported by seventy-two cast-iron pillars. There are several inspection and air shafts. The present engines and pumps at the Stourport Road station will supply the water to the reservoir, the water being obtained from a bore-hole in the Bunter beds of the new red sandstone. Considerable difficulties were experienced in the construction of the works during the last severe winter, and the works were much delayed thereby. They have been most satisfactorily carried out by the contractor, Mr. George Law, of Kidderminster, who has constructed several large undertakings for works of water supply in different towns for the same engineer. The total cost of the reservoir, including the purchase of land, is stated approximately at 6,800*l*. Mr. Peirce and Mr. Tarbet were the resident engineers. The total outlay which the Local Government Board sanctioned for improvements in the water supply and sewerage of Kidderminster was about 25,000*l*., and in round figures two-thirds of this sum has been expended up to the present time.

SANITARY EXHIBITION AT YORK.

The Congress of the Sanitary Institute at York closed on Saturday night, after an agreeable and interesting week. It now only remains for us to call attention to those exhibits in which the readers of *The Architect* are likely to feel interested. These are few in number, for, although the exhibition as a whole is attractive and undoubtedly contains many good appliances, there are but few novelties, and but a small number of exhibitors connected with the architectural or building trades. The most important exception on the score of novelty is to be seen on the stand of Messrs. Joseph Cliff & Sons, Wortley, Leeds. We allude to Winser's channel pipes and bends, manufactured by them, but the invention of Mr. Winser, of Buckingham Palace Road, S.W. They are intended for laying in inspection chambers, and are made to form three-quarters of the circle instead of half, as in the old arrangement, and remedy a defect generally admitted to exist in the old

MELBOURNE INTERNATIONAL EXHIBITION, 1880, THE GOLD MEDAL

"A magnificent set of Picturesque Views in Holland, which appear in the finest style, and display the exquisite touch of a born artist."
GILBERT WOOD & CO., 175 STRAND, LONDON, W.C.

kind. These channels are also made perfectly flat on the bottom, so that they are easily and securely laid. The advantages, too, of the increased covering of the channel are very marked. As the additional covering is at the part opposite to that at which the sewage enters, instead of being probably thrown over the bottom of the inspection chamber, it is prevented from doing so by striking against the extra covering, and in passing round the bend it is concentrated and folded over as a wave and turned in the direction of the outgo. In connection with these is shown Winser's improved iron inspection covers and frames, and an intercepting sewer-trap by the same inventor, the three inventions being, perhaps, the most perfect appliances for forming inspection chambers extant. Messrs. Cliff & Sons also exhibit most of the specialities with which their names have become associated, especially their highly-glazed porcelain baths, sinks, washing vessels, &c. A new sitz bath is shown for the first time here, and a new latrine trough, made to the order of Messrs. A. & C. Harston, for the new buildings for the Metropolitan Asylums Board, at Darenth, Kent. As the fiat has gone forth that "independent" closets are in future to hold the sway, it opens a wide field for the ingenuity of the designer to produce ornamental and decorative designs, and the Messrs. Cliff have not been slow in taking advantage of the change of fashion, the patterns exhibited being artistic and deserving of praise. There is, in addition, a new glazed flushing slop sink. The flushing openings in this sink are found formed in the clay itself around the sides, so that the metal flushing rim hitherto used, and which to some extent was objectionable, is dispensed with. They send, for the first time also, a new white glazed urinal floor and channel, and a new gully, the Simplex, reversible, so that it may be fixed in any direction required.

Messrs. W. & R. Leggott, Park Road, Bradford, are present with their well-known patent apex fanlight opener, worked with a rod and endless cord. We have often called attention to this invention, which is a simple and meritorious one, and we cannot add anything further in its favour than we have done. The firm also show their patent security bolt, intended for high doors and windows, shooting top and bottom at the same time. It is almost needless to say that it is of the *espagnolette* character, but it is a well-made article. In addition they exhibit what they term a heat indicator, which we may better call an oven thermometer, for regulating the heat in the oven for cooking purposes; also a neat little invention, called a pump pad, for attaching stamps, &c., to letters.

Messrs. Wright & Co., Westminster Chambers, S.W., send specimens of their patent fireproof fixing blocks, for walls or floors. They simply require bedding in mortar; there is no breaking up of the bond, they form a better key for plaster, and battens or flooring can be nailed on to them as on to wood joists. It is also claimed that they never get loose, are unaffected by fire or water, and are no extra cost to a building.

Messrs. Nightingale & Co., Great Grimsby, exhibit specimens of their patent wood-block flooring, which has received a veritable improvement since it last came under our notice. Each block is now tongued and grooved, and this, combined with a bevelled principle originally adopted by them, is calculated to make a flooring laid on their principle as sound as human agency can accomplish. It appears impossible by this arrangement for any single or two or three blocks to rise or become displaced; in fact, if any disarrangement occurs, the entire flooring would most likely move, and that we should imagine would be next to impossible, as the means we have described, coupled with the concrete foundation and the antiseptic compound in which each block is buried, secures the best possible safeguard. The system of tongueing and grooving also prevents the composition oozing up between the joints. The Vestry Hall at Chelsea has recently been laid with this flooring, under the direction of Mr. Bryden.

Messrs. Thomas Cordingley & Sons, Thorncliffe Road, Bradford, show their concrete flooring, which has received notice at our hands on former occasions. It is sufficient to say that this flooring is of excellent construction and generally of a most meritorious character.

Messrs. M. C. Duffy & Son, Stork's Road, Bermondsey, S.E., contribute examples of their "Immovable Acme" system of solid wood-block flooring. This, too, has been fully described in *The Architect*, and we need only add that each block is dowelled to its neighbour, with the object of securing perfectly tight and immovable floors.

Messrs. Doulton & Co., Lambeth, S.E., as usual, contribute an assortment of their specialities, and, if the display is not so large as we are often accustomed to see, the articles exhibited are of a sterling character. The exhibit comprises much of their ceramic ware in the various articles to which they have adapted it, and there is a collection of stoneware force-pumps and acid cocks, a variety of filters—a branch of their manufacture in which they are taking a leading position—and a general selection of sanitary war[illegible] and fittings.

Mr. E. S. Hindley, of Bourton, Dorset, sends one of the

GREAT YARMOUTH.

Alcazar vertical steam-engines of his manufacture. Mr. Hindley was one of the first persons to introduce portable small-power steam-engines at a reasonable price, and their attractive appearance and simplicity of construction, coupled with their good workmanship, have won golden opinions in their favour from all quarters.

The Silicated Carbon Filter Company, Church Road, Battersea, S.W., exhibit a general assortment of their appliances, which have been rendered famous in their hands. It would be a useless repetition of words to enter again into a detailed description of their construction, as they have become generally known throughout the world. The specimens shown consist of main and constant supply filters for manufacturers' use, hospitals, schools, &c.; also travelling and pocket filters. They exhibit, in addition, a new self-aërating filter, in which the waste is aërated and filtered simultaneously, rendering it pure and bright.

Messrs. Adams & Co., the popular sanitary engineers, of Monk Bridge, York, are here "at home," and have taken advantage of the proximity of their works to contribute a large display of their special apparatus. Amongst their newest inventions may be mentioned a range of latrine closets, which differs from the existing system in so far that each closet is an independent appliance made of glazed stoneware, oval in plan, the range being connected by means of 6-inch glazed sanitary pipes, and flushed by their well-known syphon flushing apparatus. There is a collection of large deep trap flushing syphons of various sizes, and an excellent circular flushing tank and grease trap combined. They also show some good strong lavatory basins in brown stoneware, suitable for schools, on white glazed brick standards, and Grace & Firth's disconnecting trap, which is an excellent apparatus. The exhibit also comprises their patent sewer ventilator gas deodoriser, which is in use in several parts of the metropolis. This apparatus takes the place of the ordinary road grid, and is finished at the top in the style of a manhole cover, the square part of its area only having the ordinary openings. Around the entrance to the sewer, and surrounding the air exit, a chamber is provided for a suitable disinfectant; a loosely-woven wire hood covers the opening, and this hood is interlaced with a coarse asbestos cloth, which dips on all sides into the fluid, and by capillary attraction entirely saturates the whole, forming a wet disinfecting filter, through which the gases from the sewer must pass ere they escape into the street, which purifies them, and renders them innocuous. A dirt-box is fitted above the disinfecting chamber, with an overflow and small check flap, to prevent the admission of sewer gases, and this affords a ready exit for the street water without contact with the disinfectant. The apparatus is simple and ingenious, and is deserving of general application. It is stated that the loss of the disinfectant by evaporation is so trifling that a renewal is not often required. During the drought experienced in the summer, complaints were rife of the abominable stenches from sewer gratings of the ordinary kind, which might have been avoided had the Adams's ventilator been fixed in them. Mr. W. J. Adams of this firm has recently elaborated a system of simultaneous flushing for sewers, to which we may revert on a future occasion.

Messrs. W. Phillips & Son, 10 Baker Street, W., exhibit an interesting assortment of sanitary appliances, amongst which we notice their "Cerus" registered patent trap, a notable invention; a grease gully, fitted with container; an inspection cap inlet, a rain-water gully, fitted with inspection cap; Scarabæus patent trap syphon grease and rain-water; fitted earthenware removable dips; also the "Cerus" registered patent closet, combining the wash-out and valve system, a very complete apparatus. There is also a registered iron door, also bearing the name of "Cerus," and a registered flushing syphon, trapped short without head of water, besides other commendable appliances.

Mr. D. T. Bostel, of the Hygienic and Sanitary Engineering Co., Limited, Duke Street, Brighton, and Charing Cross, S.W., shows the specialities originally invented by him, and which have attained great popularity, consisting of the "Excelsior" water-closet, with automatic flushing cistern, the "Artisan" closet, made with seat action, and his registered intercepting trap and manhole.

Mr. Henry Ough, of Austin Friars, E.C., shows the various applications of Stanford's patent joint as adapted to all drain-pipes, traps, syphons, gulleys, &c., which is so well known as to render further comment unnecessary.

Messrs. H. & C. Davis & Co., Camberwell Road, S.E., exhibit a variety of their gas-heating and cooking appliances, comprising some pretty adaptations of gas for winter fires, gas-heating stoves and boilers, and their well-known "Metropolitan" cooking stoves.

The Æolus Waterspray Company, High Holborn, W.C., occupy a large space with various adaptations of their well-known patent, supplemented by a large ventilating gas-heating apparatus, as specimens of electric lighting by primary battery.

Honeyman, Glasgow, diaphragm ventilator ; P. P. King & Co., Hull, Phillips's ventilator ; C. Kite & Co., London, exhaust, downcast, and chimney breast ventilators ; E. G. Wright, Portsmouth, "Reliance" chimney cowl ; Silicated Carbon Filter Company, London, improved silicated carbon filters. Exhibits which have already received medals at previous exhibitions of the Institute are excluded from awards of medals, but those exhibits to which a second medal would otherwise be awarded receive special certificates. Objects exhibited by the judges are excluded from awards of medals or certificates. The "Decedo" flushing cistern water-closet, exhibited by Messrs. Cliff & Co., which is the application of an invention of Mr. Rogers Field, is excluded from any award. The Richardson medal, for the exhibit selected from the entire exhibition, will be awarded by the judges in cases of pre-eminent merit only.

The following additional awards have been made :—

Medal.

Messrs. H. & C. Davis & Co., London, for enamelled Metropolitan gas cooking stove.

Starred Certificate.

Messrs. H. & C. Davis & Co., London, for fibre asbestos open gas fire.

BRADSHAW'S LIMMER ASPHALTE

Messrs. BRADSHAW & CO., being Sole Agents in the United Kingdom for, and possessing proprietary rights in, the Freehold Mines of the German Asphalte Company (of which Mr. C. W. Bradshaw is also a Director), situated at Limmer, near Hanover, and Vorwohle, Brunswick, possess special facilities for reliable and prompt delivery of their celebrated "LIMMER ASPHALTE" at low rates, either for sale in its natural state or ready for laying by their own workmen in any part of the United Kingdom. EACH BLOCK supplied from these Mines, besides bearing the impress of the Company, is stamped with the words "BRADSHAW & CO." The attention of Architects, Engineers, &c., is particularly called to the fact that the "LIMMER ASPHALTE" is especially suitable for use in the construction of Reservoirs, Roofs, &c., where water-tightness is extremely essential. For such purposes **Over 2,000,000 (Two Millions) of Square Feet of "Limmer Asphalte"** have been executed by Messrs. BRADSHAW & CO.; while for Paving purposes **Over 50 Miles of "Limmer Asphalte" Footways** have been laid by them in the LONDON DISTRICT ALONE. Messrs. BRADSHAW & CO. will be happy to forward Prices, Samples, and Testimonials, and give all information on application to:—

A Business Supplement

The Contract Reporter.

to The Architect.

LONDON, OCTOBER 8, 1886.

THE ARCHITECTURAL ASSOCIATION.

THE annual conversazione of the Architectural Association will be held this (Friday) evening. The services of the band of the 2nd Life Guards have been secured for the occasion, and in the course of the evening a concert will be given, for which, among others, Mr. W. H. Brereton, Mr. Harold Savery, and Miss Mary Morgan have promised their services, Mr. Victor Gollmick being the accompanist. During the concert Mr. Cole A. Adams has undertaken to give a dramatic sketch. Several firms will, as hitherto, exhibit samples of art work, &c., and, among these, Messrs. Jeffreys & Co., wall papers; Messrs. Longdin, metal work, &c.; Messrs. Woollams, wall papers. Messrs. William Morris & Co., we believe, will be represented. Electric lighting will form a feature of the exhibition, two firms being present. The syllabus of meetings for the new session shows a series of excellent lectures. Mr. Aston Webb will give a lecture on "Pupilage." "Church Planning," by Mr. J. D. Sedding, comes next on the list. Then "Decorative Metal Work," by Mr. H. Longden; "Fireplaces," by Mr. T. Pridgin Teale; "The Complement of Architectural Instruction," by Mr. Thomas M. Rickman, F.S.A.; "House Sanitation," by Dr. Corfield; "The Architecture of Art," by Mr. Walter Crane; "Welsh Churches" (illustrated), by Mr. A. Baker; "Architect and Contractor," by Mr. H. Lovegrove; "Metric Projection," by Mr. H. H. Stannus; "Stray Thoughts on Architectural Education," by Mr. G. Aitchison, R.A.; and "Travelling Student's Notes on Gloucestershire," by Mr. R. W. Paul.

R. ADAMS,

17 BLACKMAN STREET & 7 GREAT DOVER STREET, LONDON, S.E.,

INVENTOR and PATENTEE of the

SAFETY WINDOW WITH REVERSIBLE SASHES

FOR INEXPENSIVE AND PERPETUAL CLEANLINESS,

Which has gained at the INTERNATIONAL HEALTH and SANITARY EXHIBITIONS

Two Gold, Four Silver, and Four Bronze Medals, and Sixteen Diplomas of Merit.

IMPORTANT NOTICE.

The Patentee has been advised by several of his friends to form a Company for the Manufacture of the above-mentioned Sashes in larger numbers, for the supply of the Trade and for the Home, Colonial, and Foreign Markets. Hitherto he has only supplied the Fittings, except under very special circumstances. He now proposes to manufacture the Sashes complete with Fittings.

Provisional Protection has just been granted for another Patent, whereby the Sashes will be greatly reduced in price, and, consequently, brought within the requirements of every Architect and Builder.

If any of the readers of this journal wish to receive further particulars or to take Shares in the proposed Company, they are requested to make early application to the Patentee, as it is expected that the larger number of the Shares will be privately subscribed.

Applications for Shares will be taken in the order in which they are received.

BATH.

For Additions to Royal United Hospital Laundry. Messrs. Browne & Gill, Architects, 1 Fountain Buildings, Bath. Burden & Giddings, Bath.

VOLUME XXXV. OF THE ARCHITECT.
Handsomely Bound in Cloth, Gilt Lettered, price 12*s.* 6*d.*
Office: 175 Strand, London, W.C.

GRUNDY'S PATENT WARM-AIR VENTILATING FIRE GRATE.

The novelty, superiority, and advantage of this patent consist in the heating surface being greater than any other Fire-grate introduced to the public. It is very simple in construction, and is made in the form of a Stove, the back of which is semicircular in shape, with gills behind and smoke-nozzle on top, all cast in one piece. The same can be attached to any design of a Register or Stove front. It is very suitable for schools, class-rooms, waiting-rooms, hospitals, offices, dormitories, and dwelling-houses, from the cottage to the mansion. Design and specification post free on application.

TESTIMONIALS.

"9 Victoria Chambers, Westminster, S.W.: June 10, 1884.
"SIR,—I have much pleasure in testifying to the efficiency of your patent warm-air fire grate. It has been very successful, and given every satisfaction where I have used it. Yours, &c.,
"To Mr. Grundy. JAMES WEIR, F.R.I.B.A."

"6 John Street, Bedford Row, W.C.:
"December 16, 1885.
"DEAR SIR,—I have now had an opportunity of testing your patent grate, and am glad to be able to say that I am most agreeably disappointed, because, as you are aware, I was rather sceptical about its powers when you showed it to me; but now I can say it answers admirably, and heats abundantly my porch-conservatory.—I am, yours truly,
"R. S. LANDER, F.R.I.B.A.

"To Mr. John Grundy."

From James Garry, Esq., Architect, West Hartlepool, July 1884.

"DEAR SIR,—I have very great pleasure in stating that the first stove, or patent warm-air ventilating fire grate, adopted by me in school at Seaton, and a second in a Cocoa Palace, have given such satisfaction that I now order eleven to be inserted in New Upper Grade Schools in course of erection at West Hartlepool. They are the most economical, efficient, and easily managed stove at present before the public.—Mr. John Grundy."

From Hon. and Rev. G. G. C. Talbot, M.A., Withington, Cheltenham.

"DEAR SIR,—You will be gratified to hear that the school is completely warmed by your new grate. It is the most economical and efficient that I have ever seen.—Mr. John Grundy."

Society of Architects, Architectural and Building Trades Exhibition, 1885:—"5 Great James Street, Bedford Row, May 1.—The warm-air ventilating grate shown by Mr. John Grundy at Stand 75 Floral Hall, is an admirable contrivance for utilising the heat conducted through the back and sides of the stove, for warming schools and buildings by a supply of freshly warmed external air."

Apply to JOHN GRUNDY, 30 Duncan Terrace, City Road, London.—Works: TYLDESLEY, near Manchester.
Agent for Scotland, SEPTIMUS HARPUR SMITH, 1 Upper Gilmore Place, Edinburgh.

NOTES ON NOVELTIES.

Engraved Glass.—The London Engraved and Etched Glass Company (Limited), of Mildmay Chambers, Union Court, Old Broad Street, E.C., are just introducing their new engraved glass for architectural and decorative purposes. By this patent process fac-similes of pictures can be reproduced by etching on glass. We would draw special attention to the engraved mirrors, which are a speciality of the company. This work has hitherto been wrought by hand diamond engraving upon glass. By this new process an exactly similar effect is produced, but at a very greatly reduced cost. We have inspected some beautiful specimens of fine engraving upon brass by the same process, and which we are told can be executed upon any metal, and also plates to be used by paper embossers. At the same time, the company are showing samples of leaded glass etched by their new process, the effect of which is quite equal to hand-painted glass. Street lamp tablets made by this firm, in a far superior style and at a lower cost than by the old system of embossing, have been already adopted by several large towns. We would recommend those of our readers interested to pay a visit to the above address, and we are sure that the time so spent would be well repaid.

TRADE NOTES.

WE have just had an opportunity of seeing two very fine stained-glass windows at the studio of Messrs. Bussell & Gibbs, Wells Street, W. They are intended to be placed in the town hall, Windsor, and are well worth a visit; they will remain on view for a few days. The windows are in three panels; in the centre are exceedingly life-like medallion portraits of H.R.H. Prince Leopold and H.R.H. Princess Beatrice, with their respective arms in the top panels, and the borough arms of Windsor in the lower panels, the ground being a pale vellum tint with a Tudor rose, the whole surrounded by a rich coloured border, with rose and crown device at the top and bottom, an inscription commemorating the birth and marriage of their Royal Highnesses, and in the case of Prince Leopold his death at Cannes, March 28, 1884.

MESSRS. FARADAY & SON, of Berners Street, W., have appointed the Vitrite Company of New York agents for the sale of their electric light fittings in the United States. The same firm has just introduced a new shade of rice paper of delicate tints to suit the Vitrite lamp holders. These, with their frames, cost about one-fourth of the price of the ordinary glass shades.

THE Architectural Association will to-morrow (Saturday) visit Mr. Stonor's house at Ascot, of which Messrs. Ernest George & Peto are the architects. We especially recommend the visitors to notice the excellent brickwork. The whole of the facing bricks and tiles were supplied from the brickworks of Messrs. T. Lawrence & Son, of Bracknell.

THE Town Council of Taunton have decided to employ electric light as the illuminant of their town. The system to be employed is that known as the Thomson-Houston arc system, which has already been subjected to a period of probation in a portion of the town, and has most successfully withstood the test. It is now to be used in all the principal portions of the town, and a contract for a period of seven years has been entered into, with a proviso, however, that it may be terminated by either party to it at the end of the third or fifth year, in the event of the light not proving such a success as it is confidently anticipated that it will. The work of installation is in the hands of Messrs. Laing, Wharton & Down, of 8 and 9 Holborn Viaduct, E.C.

ON Tuesday, October 12, Messrs. E. Jansson & Co., timber brokers, of 50 Bishopsgate Street Within, London, E.C., will hold their next sale at the "Baltic," when, we are informed, a valuable assortment of doors, mouldings, deals, battens, floorings, spruce, pine, St. Petersburg poles, &c., will be offered in lots specially made up to suit small buyers. The periodical timber sales of this well-known firm are worth the attention of purchasers of large or small lots.

IN the notice given of the patent of the Spencer Corona Company, of 3 Hyde Street, New Oxford Street, W., we omitted to state that the "corona" can act only as a preventative of blackened ceilings when used on the top of gas globes, where it also acts as a complete ventilator for the vitiated air.

A MEMORIAL window has just been fixed in the south aisle of Headingley parish church by Messrs. R. W. Winfield & Co., of Cambridge Street, Birmingham, with stained glass illustrating *The Transfiguration*, the subject occupying the three lights, with the scene of *Healing the Paralytic at the Foot of the Mountain* illustrated below in the base, also running through the three lights. The window was designed by, and executed under the superintendence of, Mr. T. W. Camm.

THE fine memorial church of St. John the Divine, at Triangle, Yorkshire, has lately been thoroughly renovated and

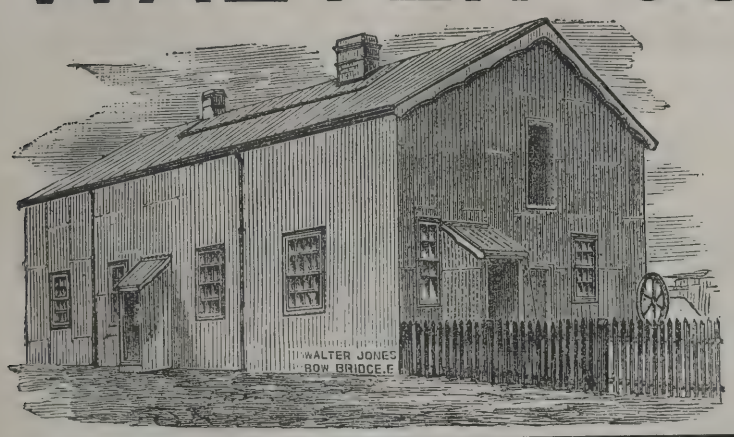
decorated. The decorative work has been entrusted to the well-known firm of ecclesiastical decorators, Messrs. Heaton, Butler & Bayne, of 14 Garrick Street, London, who supplied the whole of the beautiful stained glass placed in the church when erected. The chancel has a light, chaste, and pleasing appearance, and reflects great credit on the artists. Both vestries and the organ chamber have received special attention. Mrs. F. E. Rawson, of Thorpe, has generously defrayed the whole of the cost, which includes expenses attached to the organ, &c.

The Works Committee of the Southampton Town Council have received a letter from Mr. Arthur Reynolds, whose tender of 1,844*l.* had been accepted for the erection of certain cottages in connection with the water supply at Otterbourne, pointing out that an error had been committed in his tender, which should have been 2,844*l.* Though he was rendered liable to be held to his contract, the committee have allowed him to withdraw from it, on the forfeiture of his 10*l.* deposit, and to this he agreed.

THE ROYAL JUBILEE EXHIBITION, MANCHESTER, 1887.

The executive committee of the exhibition have issued their prospectus and regulations for exhibitors. The purpose of the exhibition is to illustrate, as fully as possible, the progress made in the development of arts and manufactures during the Victorian era, principally under the following sectional headings:—1. Industrial design, as shown in textile fabrics, pottery, glass, metal, wood, marble, and stone work, and all useful articles having a decorative or ornamental design. 2. Machinery in motion, and general engineering plant and appliances. 3. Chemical and allied industries. 4. Handicraft work in process of production. 5. Works committee, and representation of old Manchester and Salford, model of the Ship Canal, &c. 6. Fine arts—limited to works of art produced in the United Kingdom during the reign of Her Majesty the Queen. 7. Electric light, music, horticulture, &c. The prospectus further states:—



The site chosen is at Old Trafford, adjoining the Botanical Gardens, which it is proposed to incorporate with the exhibition. It will cover a space of about thirty-two acres, which, in case of need, may be extended, and is of easy access from the city by road and rail. The plans of the building, which have been approved by the executive committee, are exceedingly simple and compact. The main building consists of a central nave 1,022 feet long and 56 feet high, with a transept across the centre 370 feet long and the same height, and two lower transepts near the ends of the nave 60 feet wide. At the intersection of the nave with the central transepts is a dome 90 feet in diameter and 140 high, and at the intersection of the nave with the low transepts are square pavilions of a lower altitude. The spaces between the nave and the arms of the cross are filled with exhibition courts, in bays 30 feet wide. The machinery in motion will be provided for in a large annexe, separated from the main building by a 70 feet roadway, with a covered fireproof gallery of communication. Special care has been taken in the construction of the section intended to be devoted to fine arts. It is completely isolated from the main building by stout brick walls, with iron sliding fireproof doors; the brick walls will be covered inside with Parian cement, which secures absolute immunity from damp. The most complete arrangements will be made for watching, night and day; and the lighting will be so arranged that under no possible circumstances can any injury arise to the works exhibited. The committee therefore confidently appeal to the owners of treasures of art produced during the reign of Her Majesty the Queen, trusting that they will generously respond to the desire that this exhibition shall be in every way a worthy successor to the Great Art Treasures Exhibition held at Manchester in 1857. The guarantee fund exceeds 132,000*l.*, and the guarantors are represented by a council elected from their body, presided over by Mr. Alderman Philip Goldschmidt (Mayor of Manchester), and which council represents the ultimate court of appeal on all matters connected with the exhibition. The entire control of the whole arrangements is in the executive committee appointed by the council of guarantors, consisting of thirty members, with Sir Joseph C. Lee as chairman. The Lancashire and Yorkshire Bank (Limited) have undertaken to open a branch in the exhibition building, for the convenience of exhibitors and others, where all ordinary banking business will be transacted.

Of the regulations for the guidance of exhibitors, the following are of general interest:—

Exhibitors will be required to keep their stands clean and in good order, and will be permitted to employ attendants for this purpose, and to explain their exhibits. Such persons may receive orders, but shall not solicit them to the annoyance of the public or other exhibitors, and any exhibitor or assistant so doing may be expelled from the building and have his ticket cancelled.

Exhibits which are manufactured within the exhibition may

be sold and removed, but no exhibit will be allowed to be removed from the exhibition without the written permission of the general manager.

Should the exhibitors in any class require to have the relative merits of their several exhibits decided, the Executive Committee will, upon a requisition being made to that effect, appoint a technical jury for such purpose, whose judgment shall be absolutely final and conclusive.

Exhibits in the fine arts section will be strictly limited to works of art, viz. :—Paintings in oil and water colour, sculpture, engraving, etching, lithography, photography, and wood engravings produced in the United Kingdom during the reign of her Majesty the Queen.

Applications for space must be lodged on or before November 1. No exhibits will be received before March 15, 1887, except by special permission, and all goods must be delivered before April 15, and be in order by April 25, 1887.

SANITARY PROGRESS IN LIVERPOOL.

An address was delivered on Monday by Dr. Carter, the president, at the annual meeting of the Literary and Philosophical Society of Liverpool. The subject was, "Some Results of Recent Sanitary Legislation." He commenced by referring to what was said by Condorcet at the time when the philosopher was hiding in Paris, and shortly before he was guillotined. "It cannot be doubted," he wrote, "that the progress of the sanative art, that the use of more wholesome food and more comfortable habitations, that a mode of life which shall develop the physical powers by exercise, without at the same time impairing them by excess; in fine, that the destruction of the two most active causes of deterioration, penury, and wretchedness on the one hand, and enormous wealth on the other, must necessarily tend to prolong the common duration of man's existence, and secure him a more constant health and a more robust constitution. It is manifest that the improvement of the practice of medicine becomes more efficacious in consequence of the progress of reason, and that social order must in the end put a period to transmissible or contagious disorders, as well as to those general maladies resulting from climate, ailments, and the nature of certain occupations." Now, when it is remembered that Condorcet died in 1794, when none of those accurate inquiries into the intimate nature and mode of propagation and prevention of contagion, which have already borne much, and are destined to bear much more, fruit, had been entered upon or, perhaps, even thought of; and when it is further remembered that Voltaire, Condorcet's intimate friend and the literary king of his age, is accredited with saying that physicians were a class of men who put physic, of which they knew little, into stomachs of which they knew less, it must be admitted that Condorcet's belief in the future enlightenment and influence for good of that kind of men was little less than miraculous. Dr. Carter then went on to explain the sanitary progress of Liverpool. In 1843 it was said to be without exception the unhealthiest town in England.

By an enumeration made under the authority of the Town Council in 1841, there were 1,982 courts, with 55,534 inhabitants, in the parish of Liverpool. Of these courts 629 were closed at both ends, 875 were open at one end; and only 478 were open at both ends. By a return made in 1848 there were then 14,472 court-houses, of which 88 per cent., or 12,735, were inhabited, and by far the greater number of which would require to be dealt with as insanitary dwellings. Allowing six persons for each house, this would give 76,410 as the number then living in courts. The courts to-day, like those of 1843, are constructed on a vicious principle. Only a little better than court and cellar were the streets where the poor lived and died. In one large district, bounded on one side by Vauxhall Road and on another by Scotland Road, comprising 2,500 front houses, no fewer than 922 had neither yard, ashpit, nor privy. These facts will give some faint idea of the condition of a very large part of Liverpool in 1848. It really would not have been surprising if the authorities had been paralysed by the enormity of the difficulties that confronted them, and had decided to do nothing out of sheer despair at the hopelessness of the attempt. Happily, this is not the English way, and it was not their way. Their first step was to obtain an Act of Parliament—that of 1842—which among other things provided for a minimum width for new streets and courts; a certain size for rooms; for the construction of windows which would open and shut; for the closure of cellars in courts; for the modification as to height, and for the ventilation of other cellars; for the construction of ashpits, privies, and drains; for the flagging of courts; and for the compulsory cleansing of filthy and unwholesome houses at the expense of the occupier, who was liable to distress in default of payment. It still permitted one end of a court to be built up, however, and the entrance to be narrowed six feet in width for the erection of privies and ashpits. But, besides this

The Celebrated "DUBOIS" Hydraulic Drawn Lead TRAPS and BENDS.

The above Shapes and Sizes always in Stock, and we are prepared to furnish SPECIAL SHAPES to order at short notice. These justly celebrated TRAPS are made from Pure Pig Lead by Hydraulic Machinery after the manner of Lead Pipe, and have peculiar advantages appreciated by every Plumber. They are greatly superior to either Cast or Hand-made Traps, as they have no SEAM, are of UNIFORM THICKNESS, PERFECTLY SMOOTH INSIDE AND OUTSIDE, and can be FLANGED, PLUGGED, and STRETCHED, without fear of SPLITTING. No possibility of Sandholes.

FOR PERFECTION OF MANUFACTURE THESE GOODS ARE PRE-EMINENT.

For Sale generally by the principal Lead Merchants and Wholesale Dealers in Plumbing and Sanitary Appliances throughout Great Britain and Ireland.

DUBOIS MANUFACTURING CO., London and New York.

London Office and Works :—15 BRITANNIA STREET, KING'S CROSS, W.C.

last fatal error, there were two serious drawbacks to the efficient working of the Act. It was useless to order the drainage of houses without providing sewers to drain them into; and it was equally useless to say that unwholesome dwellings were to be cleansed unless there was someone in authority to say when the dwellings were unwholesome. The next step, therefore, was to do away with the Commissioners of Sewage, who made but few sewers, and put the work into more competent hands.

The good effects of these changes soon began to be shown. In the six years preceding 1856, fifty-eight miles and a half of sewers, and nearly thirty-one miles of court and passage drains, were constructed; while between 1847 and 1856 no fewer than one hundred and fifteen and a half miles of sewers were built, and this work has been going on ceaselessly ever since, so that to day there is not a court, alley, or passage, however poor, that has not the means of passing off its foul liquid into a sewer. Courts have been flagged, drained, whitewashed, and provided with a plentiful supply of pure water directly from the mains; many of them have been opened up to light and air; cellars have been closed; streets have been rendered impervious to soakage, while their surfaces are daily cleansed; foul privies and middens have been disappearing, and a more rapid removal than formerly of refuse matter effected; and this with results so splendid that they almost encourage us to hope that, when completer efforts shall have been made, supported by a newer and more enlightened generation, the magnificent dream of Condorcet may not be so impossible of realisation as most men have hitherto thought.

THE COMPANY OF PLUMBERS.

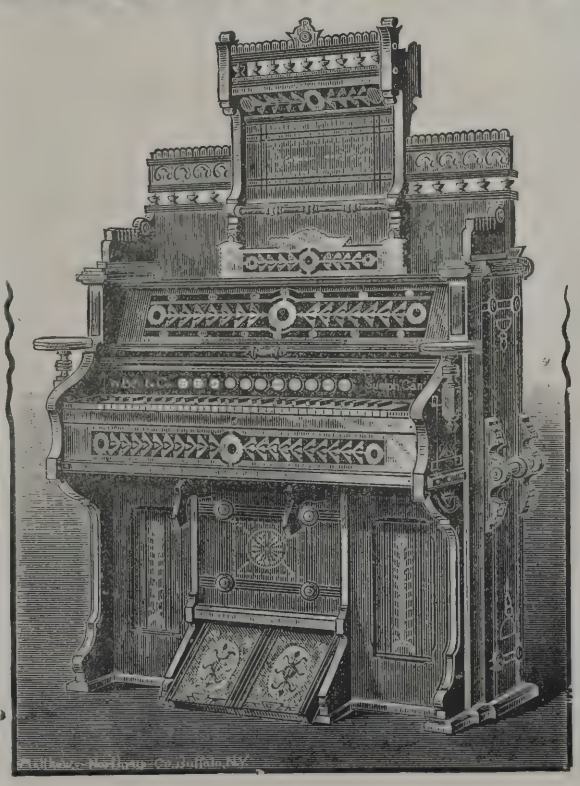
At the quarterly meeting of this company, Alderman Stuart Knill was elected master and Messrs. F. Machin and W. H. Bishop upper warden and renter warden respectively. The mastership of the company has been held previously for three successive years by Mr. George Shaw, C.C., the duration of the office being exceptionally extended in recognition by the court of the special value of the services rendered generally by Mr. Shaw to the objects of the company, and especially with reference to carrying out practically the registration of plumbers and the establishment of the technical classes of instruction for plumbers now held in connection with the City and Guilds Institute at Finsbury.

THE BIRMINGHAM MASONS AND TERRA-COTTA.

On Monday last a deputation from the Trade Society of Birmingham Stonemasons waited upon the mayor (Alderman Martineau) for the purpose of representing to his worship certain facts having reference to the use of terra-cotta in the new Assize Courts. The deputation, which was introduced by Councillor Whateley, consisted of Mr. H. Keyse, chairman of the society, and Mr. J. Farr, secretary. Mr. Whateley said his desire in introducing the deputation was that they should have an opportunity of demonstrating that stone was a better material than terra-cotta in building.

The deputation urged that terra-cotta had been spoken of to the General Purposes Committee of the town council in such a way as to damage the interests of the stonemasons' trade. Stone was stronger in every way, more durable, and able to "carry a better line"—that was to say, to preserve the integrity of its position in a building. As evidence of the weakness of terra-cotta, they referred the mayor to the archway of the new Liberal Club, which was already cracked, and in which the lines of the fluting were no longer parallel, and to several other examples. They represented, moreover, that if terra-cotta were the medium used for the Assize Courts, a sum of between 20,000*l.* and 30,000*l.* would be spent outside the town, which might go to benefit its inhabitants; and they were anxious to ascertain if it had been definitely decided to use terra-cotta.

The Mayor, in reply, said he believed that the contracts had not been given out, but he could not say if the matter was open now to reconsideration. He would, however, convey to the proper persons the representations which had been made to him. The deputation thanked the Mayor and withdrew.



Mr. Jethro A. Cossins writes in respect of what is above stated about the terra-cotta of the clubhouse:—

As architect of the Liberal Club, will you permit me to say there are no signs of any failure of the minutest kind in the terra-cotta used in that building, and that I have perfect confidence in its ability to resist the great pressure to which it is in some parts subjected, and to defy the acid-laden atmosphere of this or any other town.

The deputation from the masons, introduced to the Mayor by Councillor Whateley, were singularly unfortunate in their search for facts on which to base their demonstration of the inferiority of terra-cotta, as there is not the slightest sign of crushing or splitting in the building which the masons seemed

to have examined so anxiously in the hope of finding it. The small crack visible in one of the blocks of the arch over the doorway of the club is only a fire crack, the result of the enormous heat to which it has been subjected, and does not indicate any weakness in the block whatever. As to its yielding to the load above it, that is quite out of the question, as it has little more to do than carry its own weight, there being no superstructure to the porch.

Now the arches of the Arcade in Edmund Street each carry more than 120 tons, and this without the least sign of giving; but even if a slight sign of yielding to pressure could have been found, it would be no more than can be seen in very many of the stone buildings of the town, and would therefore go for nothing.

I know, and everybody else knows, that the same accuracy of lines that may be attained in stone cannot be expected in terra-cotta. But this difficulty should be remembered in designing the building, and the details should be adapted to the capabilities of the material. These slight defects would then become of secondary importance. It seems to be a pretty general opinion that in our climate—cold, grey, and murky for nine months out of the year—the colour of terra-cotta is extremely bright and agreeable.

THE FORTH BRIDGE.

THE fourteenth quarterly report of inspection by Major-General Hutchinson, R.E., and Major Marindin, R.E., of the works in progress for the construction of the bridge over the river Forth, dated August 31, 1886, says:—We have the honour to report, for the information of the Board of Trade, that, in compliance with the instructions contained in the order of October 26, 1882, and in accordance with the Forth Bridge Railway Act of 1882, we have made our fourteenth quarterly inspection of the works in progress for the construction of the bridge over the river Forth at Queensferry. During the last quarter very considerable progress has been made in all the branches of the works, as will be evident from the following remarks:—

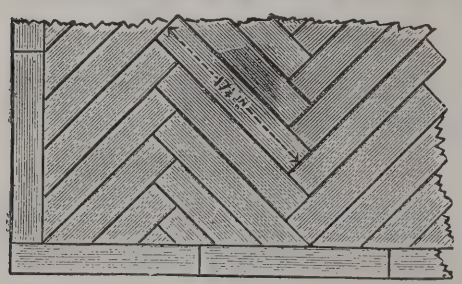
Temporary Works.

Large additions have been made to the plant, chiefly for erection purposes; these include hydraulic apparatus, goliaths, cranes, hoists, steam winches with boiler, and a number of powerful and special-designed machines for rivetting the 8-feet and 12-feet tubes. These machines consist of internal and external frames constructed to slide up the tubes and form supports for the rams which execute the work. The external frames surrounded by wire netting form cages within which the men engaged are enabled to carry on their operations with safety both to themselves and to those at work beneath them.

Permanent Works: South Queensferry.

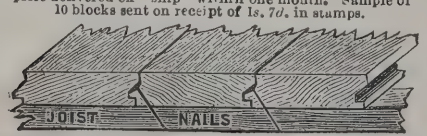
Main Piers.—The lower bed-plates are now complete. On the two southern piers the skewbacks, with the junctions therewith, about 30 feet of the vertical columns and struts, and 20 feet of the bottom members of the cantilever are in position and partially rivetted. On the north-east pier nearly the whole of the skewback and junction, about 15 feet of the vertical column, and 10 feet of the diagonal struts, are bolted up, and the rivetting is in a forward state. On the north-west pier about half of the skewback is in position, and the rivetting has been commenced. The bracing girders between the skewbacks are practically complete; the horizontal tube between the eastern skewbacks is complete, and that on the western side is being rivetted. Including the tubes and girders, about 1,175 tons have now been rivetted.

Cantilever and Viaduct Piers.—The main girders on No. 3 span have been completed, and have been joined to those on Nos. 2 and 4 spans; the girders on the whole of the spans have been raised to the level of 63·75 feet above O.D., the masonry having been raised 24 feet both on the cantilever pier and on piers Nos. 3 to 9 inclusive.



Inchgarvie.

Main Piers.—About three-quarters of the skewback on the north-west pier is bolted up, and about one-half of the rivetting is complete. The upper bed-plate on the south-west pier is rivetted; that on the south-east pier is erected, and the rivetting is being proceeded with. Since the last report about 56 feet have been added to the western tube, and about 32 feet to the eastern tube; about two-thirds of the northern bracing girder has been bolted up, and the greater portion rivetted. About 1,000 tons of steel work have now in all been rivetted.



North Queensferry.

Main Piers.—Since the last report rivetting has been commenced, and is being proceeded with on all the skewbacks. The rivetting of the horizontal tubes and bracing girders has been completed. The wind bracing between the vertical

columns has been commenced, and both on the north and south columns it has been bolted up as far as the first intersection, a distance of about 85 feet. The erection of the upper portion of the main bracing columns is now in progress. This work is carried on with the aid of movable platforms, one on each side; these platforms (provided with fencing) are supported on girders, which again are carried by cross girders; the whole structure is raised as required by means of hydraulic rams of great power attached to the vertical columns, one to each. These platforms have now been raised about 23 feet without any difficulty. The steel plates are raised as required in guides by steam hoists to the level of the platforms, where they are received and placed in their ultimate position by goliaths fitted with hydraulic lifting and traversing gear running on rails the whole length of the platforms. The machines for rivetting the vertical columns and struts between them are put together, and two of those for the 8-feet tubes are working satisfactorily. The total quantity of steel work rivetted at North Queensferry amounts to 1,250 tons.

Cantilever and Viaduct Piers.—Since the last report the cantilever pier has been raised 14·5 feet, and the viaduct piers 22·75 feet, or to 107 feet and 103 feet respectively above O.D. The girders have been lifted 22·5 feet, and now stand 108 feet above O.D.

General.

Masonry and Concrete.—Up to the present date 372,000 cubic feet of granite have been delivered, and 337,000 cubic feet set. About 98,000 cubic yards of rubble masonry and concrete work have been built, and about 20,000 tons of cement have been used.

Steel Work.—The whole of the skewbacks have been completed in the yard, with the exception of a small quantity of drilling and fitting for that for Inchgarvie, N.E.; the fitting of the plates and angles at the important junctions of the 8-feet tubes at their crossing between the vertical columns at the North Queensferry piers is being proceeded with. Including the horizontal and vertical tubes erected on the main piers, 4,000 lineal feet of 12-feet tubes and 4,500 lineal feet of 8-feet tubes have been fitted and drilled. Of the lattice tension members and bracing girders 7,725 feet have been drilled, and the greater portion of the latter have been erected. The main girders of the internal viaduct between the vertical columns at the North Queensferry piers have been drilled and fitted, and the top and bottom booms for the same at the South Queensferry piers have also been drilled. In all 27,232 tons of steel have been delivered. The average number of men employed on the works has been increased, and is now 2,545. We are of opinion that the works have made rapid progress during the past three months, and we have every reason for continuing to be satisfied with the way in which they are being executed.

EMPLOYERS' LIABILITY IN GERMANY.

THE following report was prepared by Mr. A. F. G. Leveson-Gower, second secretary to the Embassy at Berlin :—

The liability of employers to compensate workmen injured in their service depends on special legislation, the first law passed on the subject being the "Haftpflichtgesetz" (law relating to the liability of employers to pay compensation to persons injured in their service or in their trade), promulgated on June 7, 1871. This law was passed, not only for the benefit of workmen, but for the benefit of all persons injured by the working of railways, mines, quarries, and manufactories.

By the "Haftpflichtgesetz," any person injured on a railway, or in the railway service, was entitled to a compensation from the railway direction, unless the said railway direction could prove satisfactorily that the accident had been caused by circumstances over which it, as an employer of labour, could have no control ("höhere Gewalt"), or by the fault of the injured person himself; also by this law any person injured by the working of a mine, quarry, or manufacture, was entitled to compensation from the owner of such mine, quarry, &c., provided the person injured could prove that the injury had been caused by the negligence of the owner, or of a functionary in a position of authority in the owner's service.

The above law, "Haftpflichtgesetz," although not formally abrogated, has practically been superseded, as far as workmen are concerned, by the "Unfallversicherungs-Gesetz" of July 6, 1884.

This law, which has been in force since October 1885, imposes on the employer the obligation :—(*a*) to compensate workmen injured in his service; (*b*) to pay a pension to the widows of workmen killed in the service; (*c*) to maintain the children of workmen killed in the service till they have reached a specified age.

The effect of the law has been that employers, for their own protection and in order to spread their risks over as large an area as possible, have been grouped by law into trade associations termed "Berufsgenossenschaften."

VOLUME XXXV. OF THE ARCHITECT.

HANDSOMELY BOUND IN CLOTH, GILT LETTERED. Price 12s. 6d.

OFFICE: 175 STRAND, LONDON, W.C.

The statutes of each such Berufsgenossenschaft must receive the sanction of the Government.

Each branch of trade or industry in which the risks are similar and equal (for instance, the iron and steel trade, chemical industry, textile industry, sugar, or tobacco manufactories, &c., &c.), has been formed by law into a Berufsgenossenschaft for each such branch of industry within a certain geographical district, for the purpose of compensating workmen injured in the service of any employer who belongs to the respective district, and belongs, therefore, by law to the respective association.

Some branches of industry (for instance, the chemical industry, gas and water companies, &c., &c.) have formed only one Berufsgenossenschaft for the whole of Germany. Some other branches (the iron and steel trade, for instance), have formed several Berufsgenossenschaften, each of them for a certain geographical district.

The total number of these Berufsgenossenschaften is at present 62, each having its own administration.

By means of this organisation, if a workman in the iron and steel trade (to take an instance) is injured in the service of his employer, those employers who are banded together in the Eisen und Stahl Berufsgenossenschaft are under legal obligations to pay the compensation for the injury received, and out of the total number of eight "Berufsgenossenschaften" formed for this particular trade, those employers are liable who form that "Berufsgenossenschaft" in whose district the manufactory of the employer concerned is situated.

The funds for compensating injured workmen and the costs of administration are raised yearly from all the employers within the respective districts, in proportion to the wages paid by each employer to his workmen within the year.

The above law (Accidents Insurance Law) was extended by the law of May 28, 1885:—

1. To all workmen employed in the post, telegraph, and railway services.

2. To the trades carried on by the administration of the Army and Navy.

3. To inland navigation, the working of dredges, ferries, and rafts, to the transport of passengers and forwarding of goods, to the loading, unloading, and warehousing of goods, to cellarage, and the like.

The principles of the Unfallversicherungs-Gesetz (Accidents Insurance Law) of July 6, 1884, have been extended to all agricultural and forest labourers by a law of May 5, 1886. The day, however, on which this law will be put into force is not yet fixed.

Such are the main principles of the Accidents Insurance Law of Germany, which are simple enough in themselves, the difficulty and complexity lying in their application and enforcement. The time since the Act came into force (October 1885) has been too short to enable the employers to know how their organisation will work, and utterly insufficient to calculate what will be the expense either of management or of compensation.

The following are the answers to the questions in Lord Rosebery's Commercial Circular of March 30, taken in their order:—

1. The liability of employers comprises—(*a*) All workmen employed in manufactories, mines, quarries, forges, wharves, and in the building trade.

2. All workmen employed as masons, carpenters, tilers, stone-cutters, chimney-sweeps, or in well-digging and pump-making.

3. All workmen employed in a trade in which boilers or machines driven by elementary power (wind, water, steam, gas, hot air, &c.), are used.

4. All persons employed in the industries or trades above-mentioned who are not workmen, properly so called, but functionaries receiving a fixed salary not exceeding 2,000 marks per annum.

All persons included under these four headings are entitled to compensation when injured at their work, or, in other words, they are insured by law (*ipso jure*) against accidents suffered at their work ("Betriebsunfälle").

Only such persons as are employed in offices as clerks, book-keepers, and the like, and who, consequently, have nothing to do with the practical work, are exempted from this law.

N.B.—Officials appointed by the Government (of Germany or of a German State), or by a public community, who receive a fixed salary, and are entitled to a pension from the Government or from a municipality or other public community, are not affected by this law.

Such officials, as far as they are employed in a trade or manufactory ("Betrieb") affected by the Accidents Insurance Law, are entitled to a pension from the Government when they become unfit for service by an accident suffered in such employment, according to the provisions of the "Gesetz betreffend die Fürsorge für Beamte und Personen des Soldatenstandes

BRYANT, POWIS & BRYANT
LIMITED,

infolge von Betriebsunfällen," or law to provide for officials and persons in the military service in case of accidents (March 15, 1886).

2. The only cases in which the employers would be relieved from liability are :—First, when the injury suffered by the workman has no connection at all with the execution of his duty in his practical work, as, for instance, when a workman is injured by a fellow workman in a quarrel; or, secondly, where a workman is convicted of wilfully injuring himself, or of wilfully causing the accident by which he has been injured, and thereby loses all claim for himself or for his family for compensation.

3. It makes no difference whether a fellow workman is in authority over an injured workman or not; but should the accident have been caused by gross and criminal neglect on the part of the employer or of one of his working managers, and should this opinion be confirmed by the verdict of a criminal court, then the compensation is also paid out of the funds of the Trade Association ("Berufsgenossenschaft"), but the incriminated employer or manager, as the case may be, is bound by law to repay to the Berufsgenossenschaft the amount disbursed for the workman injured.

Even in this case it will be seen that the workman has no direct claim against his employer.

4. As far as responsibility is concerned, there is no difference between the liability of employers for the condition of machinery, plant, and permanent appliances of the work, and his liability for specific acts or defaults of his workmen.

5. The employers are obliged by law to settle the claims of an injured workman *ex officio*, without a special notice being given by the workman injured.

If for any reason the employers have omitted to settle such claim, the workman injured is bound to give notice of his claim within two years of the time of receiving his injury, otherwise he would (with some exceptions) lose his claim.

6. Employers individually, and as trade associations ("Berufsgenossenschaften"), are positively forbidden by law to restrict by contract or otherwise the rights and claims given by the law to their workmen.

All stipulations of such a kind would be null and void.

7. The right to compensation is not treated as arising out of the contract between employers and employed, but rather as a right of a public character, arising out of a natural obligation of the employer to compensate workmen injured in his service.

8. The liability of the employer begins from the fourteenth week after the accident. For the first thirteen weeks the injured workman is supported by the funds of the "Krankenkassen" (sick funds).

According to the "Krankenversicherungsgesetz" (June 15, 1885), contributions to sick funds are compulsory. To these funds the employer contributes in the proportion of one-third, the workman of two-thirds.

9. The employed do not contribute in any way or manner, either voluntarily or otherwise, to the funds out of which their insurance against accidents ("Unfallversicherung") is paid, and there in no way to the benefit conferred upon them by the law, except in so far as they are bound by law to contribute, as above stated to the "Krankenkassen" (sick funds), which support them for a period of thirteen weeks after the injury has been received.

In the case of a workman dying in consequence of an accident, his funeral expenses are paid by that "Berufsgenossenschaft" of which his employer is a member, his widow and children receiving a pension in proportion to the wages he was earning when alive.

10. The employer can in no way reduce his liability, but in order to reduce as far as possible the payments which this liability must entail upon him, he is associated by law into a "Berufsgenossenschaft" (trade association) with his fellow-employers who carry on trades allied to his own, and in which the risks are similar to his own.

Such an association and its statutes of organisation must receive the assent of the Government. By means of such associations the number of the employed, subject to the same or similar risks, becoming large (each Berufsgenossenschaft containing on an average from 30,000 to 40,000 men), the risks are spread over a larger basis, and the average of accidents, as compared with the number of the employed, is reduced.

11, 12, 13. As yet there are no legal provisions respecting the liability of shipowners for injuries suffered by sailors in their employ. But a law is being prepared at the present moment in order to extend the principles of the "Unfallversicherungs-Gesetz" to this class.

For the time being shipowners have only to provide for sailors in case of illness for a certain time—three to six months (Seemansordnung, vom December 27, 1872, § 48).

This law applies to sailors of all nationalities in the shipowner's employ.

The above laws hold good for the whole German Empire, and overrule or abrogate special laws in the individual States.

ARTISTIC SANITARY WALL-HANGINGS.

DURO-TEXTILE, Combines all the artistic and hygienic effects of a Painted Wall, at a great saving in cost. Can be SCRUBBED with Soap and Water any number of times without injury.

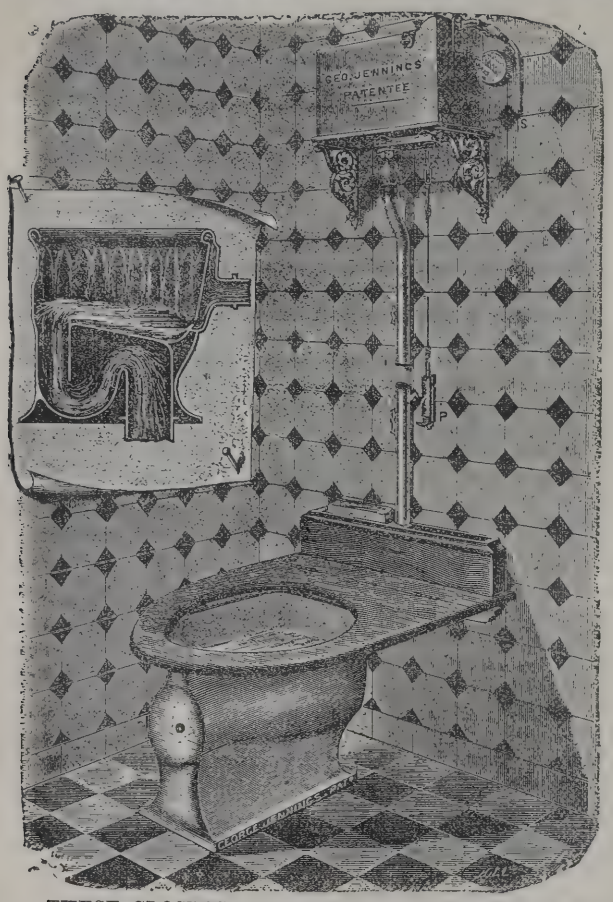
For Investment Messrs. C., S. & Co. make only one charge of $\frac{1}{16}$ per cent. commission on all descriptions of Stocks, and open Speculative accounts with from 1 per cent. cover and upwards, without any further risk or liability to their clients whatever.



THUS, £5 commands £500 Stock; £10, £1,000 Stock; £50, £5,000 Stock;
And so on to any amount.

In the transaction of speculative business Messrs. C., S. & Co. make no charge for commission or brokerage whatever unless their client makes a profit, when they take 5 per cent. of the profit made as their remuneration.

All transactions advised by wire as soon as completed. Monthly Circulars and Mining Reports post-free on application.

COLES, STEWART & CO., St. Stephen's Chambers, LONDON, E.C.

"THE PEDESTAL VASE,"
JENNINGS' IMPROVED W.C. APPARATUS

(Combination Urinal and Slop Sink).

Registered No. 16,300.

A PORCELAIN VASE set on a tiled or mosaic floor, within walls or a dado of glazed tiles. The usual wood framing, forming a storehouse for the retention and accumulation of *damp*, *dirt*, and *disease germs*, with the joints, crevices, and imperfections in work which the closet enclosure so often conceals, is entirely abolished. The seat is hinged, permitting free access for use as a *slop sink* or *urinal*, and for cleansing, so that the entire apparatus and space can be freely washed down. For this latter purpose the floor should be slightly sunk, and laid to fall to a grating, with waste carried through the external wall, and terminating in a copper flap valve to prevent draught.

☞ The suggestions as regards wall linings and floor, may, of course, be modified as best adapted to the building in which the closets are used; and in the consideration of such details, alternative schemes will readily present themselves.

At the recent **HEALTH EXHIBITION** (South Kensington, 1884), amongst a series of official tests, under the supervision of Baldwin Latham, Esq., C.E., and the Jury No. 9, Class XXIII., and successfully withstood by this closet, the following may be cited in evidence of its efficient action. Being fixed in position shown in illustration, with **"JENNINGS' PATENT SINGLE FLUSH WASTE-PREVENTING SYPHON CISTERN"** 5 feet over, with 1½ inch down pipe, ten apples (averaging 1¼ inch diameter) and a flat sponge about 4½ inch diameter were thrown into the basin. The water, as well as the whole of the exposed or dry surface, was first blackened with plumber's "smudge," and the sides covered by four pieces of thin sanitary paper, which adhered closely to the soiled surface. The handle of the cistern was then pulled, and the two-gallon flush liberated. After seven seconds (the time occupied by the discharge), a receiver placed under the trap outlet was removed, containing in the blackened water **the ten apples, the sponge, and the four pieces of paper,** no traces of the soil remaining visible upon any part of the apparatus.

GOLD MEDAL AWARDED.

THESE CLOSETS are already in use in Hospitals, Banks, Hotels, Offices, Private Residences, &c., with most satisfactory results, and, fixed in the manner described, in appearance and action leave nothing to be desired. By the novel arrangement of the supply to Basin, as shown in the sectional sketch annexed, the whole surface is well flushed and cleansed, whilst the bottom of Basin and Trap are thoroughly scoured by a concentrated rush of water which insures the **instantaneous removal** of the contents, thus overcoming the inherent defects in the many imitations recently produced of **"JENNINGS' MONKEY-CLOSET"** (the **original form of wash-out watercloset**), which was invented and patented by G. J. in 1852.

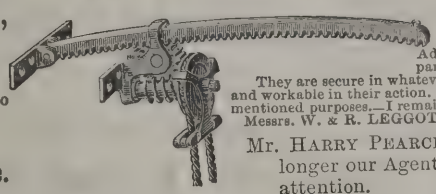
INTERNATIONAL HEALTH EXHIBITION.—MEDAL Awarded for

LEGGOTT'S PATENT ADJUSTMENT,

FOR FANLIGHTS, SKYLIGHTS, &c.,

Is admitted to be the best ever put before the Public.



From 5s. each.

Write for REDUCED PRICE LIST and Testimonials to

W. & R. LEGGOTT,

70 Park Road, Bradford, Yorkshire.

N.B.—Size and height of window no object.

TESTIMONIAL.

BANGOR, N. Wales: September 14, 1885.

Sirs,—I have pleasure in testifying that I have used Leggott's Silent Adjustments for various buildings to high skylights, fanlights, and top parts of windows, and in every case they gave satisfaction. They are secure in whatever position, whether the window is open or closed, and are quite simple and workable in their action. I prefer them to any other that I have seen or used for the above-mentioned purposes.—I remain, yours obediently, R. DAVIES, Architect.

Messrs. W. & R. LEGGOTT, Bradford.

Mr. HARRY PEARCE, 125 Great Portland Street, London, W., is no longer our Agent. All direct communications shall have our prompt attention. W. & R. L.

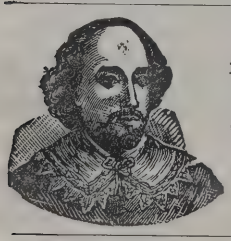
TRADE NOTES.

THE Lord Mayor of Dublin started the machinery in the premises which have been set up near Dublin for the manufacture of Portland cement. The managing director said they were able to sell the cement at 5*s.* a ton under English prices.

MESSRS. WILLIAM FALLOWS & Co., in their circular dated Liverpool, October 9, say:—"It is gratifying to be able to report an improved feeling in the trade. This is due in some measure to the restrictions which have lately been placed upon the production of pig iron, and also to the growing impression that a general revival is imminent. The continued improvement reported from America, the higher prices ruling for some staple products, the advance in Indian exchanges, better Board of Trade returns, and other minor indications, give strength to the opinion that trade is improving."

THE thirty-ninth annual dinner of the Builders' Benevolent Institution is announced to take place on Thursday, November 4, at the hall of the Worshipful Company of Carpenters, London Wall. The Society, whose benefits are so well known to the poorer members of the trade, has of late fallen off somewhat from its bounties in consequence of the want of new subscribers, which they solicit. We may mention in favour of this very excellent Institution, that the president this year is Mr. Basil E. Peto, a son of Sir Morton Peto, Bart., who was president of the Society in the year 1853, and who will take the chair at the dinner. The tickets, which can be procured at the door, are 30*s.* each, and they may also be had from the stewards, Mr. George Plucknett, J.P., treasurer, and of the secretary, Major R. A. Brutton, at the offices, 4 Vernon Place, Bloomsbury Square, W.C. We earnestly ask the members of the profession to respond heartily to the call of this benevolent institution by taking tickets, which will greatly facilitate their endeavours during the coming winter.

CONTINENTAL PASSENGER TRAFFIC.—A new steamer for the Great Eastern Railway Company's continental traffic, *viâ* Harwich, was launched on Monday from the yard of Earle's Shipbuilding Company, Hull. This vessel, which is named the *Cambridge*, is a sister ship to the Great Eastern Railway Company's steamers *Norwich* and *Ipswich*, with the exception that she is 20 feet longer. Her length on the water-line is 280 feet, breadth 31 feet, and depth 15 feet, while her engines are compound twin screws. She will be placed on the Harwich-Antwerp station early next year.



AN ARGUMENT FOR SANITARY PAINTS.

ON Monday an inquest was held at the Greenwich Union Board Room on the body of John Sullivan, a labourer, engaged at Messrs. David Storer & Son's lead stores, Poplar, who died on the 7th inst. Mr. Lakeman, Inspector of Factories, examined all the witnesses on behalf of the Government. Margaret Sullivan, wife of the deceased, stated that her husband had been at Messrs. Storer's for about five weeks, and after the first fortnight he had complained that the white lead made him feel queer. He complained of pains in his stomach and legs, and

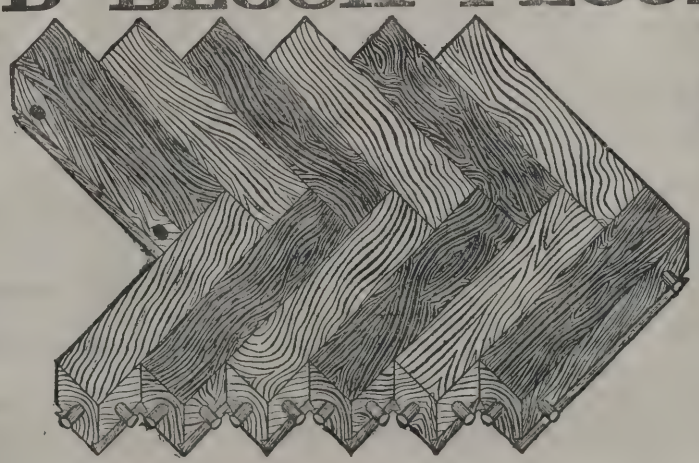
eventually went into the infirmary under the advice of Dr. Forsyth. He discharged himself thence, being under the impression that they were not doing him any good. Dr. Forsyth attended him again, but he died on Thursday last. James Sullivan, brother of the deceased, said his brother was in very good health before he went into Storer's employ, where witness also worked. The deceased had to shovel white lead in a powdered state into a machine for the purpose of mixing it with linseed oil. In doing this deceased often caused the white lead to fly about the room, and this dust would settle on his clothes, arms, and face. Deceased used to wash his hands before each meal, but this was not enforced by any rules of the firm, nor was any special drink or medicine provided for the men who dealt with the white lead. They were not provided with overalls and respirators, as was the case in factories where the blue lead was converted into white lead. William Bowman said he had been employed at Messrs. Storer's for about a year and nine months, and knew the deceased, who used to work at the white lead pan with witness and another man, each having one week on and two weeks off the white lead work. Deceased had complained to him of feeling sick of a morning. There were no rules as to washing, but the men were allowed five minutes before each meal to wash and clean themselves. In answer to Mr. Lakeman, witness said he had warned deceased to be careful in shovelling the white lead into the machine, because he made such a dust that it covered not only himself but everybody near. He knew that white lead was dangerous, because he himself had been made ill after working at it for five months. Charles Macdonald, foreman at Messrs. Storer's, said it was not a white lead factory but a paint factory. They did not manufacture white lead. There were no special regulations in their works with regard to white lead, but the factory inspectors visited them from time to time. There were no special drinks and no doctor provided, but the men who worked at the white-lead pan were paid an extra shilling a week. Dr. Burnett said the deceased was admitted to the infirmary suffering from lead poisoning; he had cramp in his feet, in the calves of his legs, and in his arms, and he also vomitted blood. He was discharged against witness's wish on October 2; he ought not to have gone out, because his case was a serious one. He had attended a great number of cases of lead poisoning, both male and female, and some patients had gone back to the works after they had recovered, and then returned again ill three or four times. In answer to questions by Mr. Lakeman, witness said powdered lead was the most dangerous form of material in which to work, because it was inhaled by the workmen and absorbed into the system. He thought the regulations regarding overalls, respirators, and other precautions used in lead factories ought also to be enforced in establishments where powdered lead was dealt with. Dr. Forsyth, medical officer of health, said he had made a *post-mortem* examination of the deceased. Death was due to suffocation from disease produced by white lead poisoning. He agreed with the previous witness as to the necessity for regulations being enforced in these works. Mr. Lakeman, in reply to the coroner, stated that regulations were in force in white lead factories—that was to say, works where blue lead was converted into white lead—for the protection of the employés. His opinion was that they ought to be enforced in the white lead stores. The jury returned a verdict in accordance with the medical testimony, expressing a hope that Mr. Lakeman would be able to make representations to the Home Office with reference to the case, to show the necessity for some extra precautions being taken in the interests of people working in mixing factories.

SACCHARINE MORTAR.

The following curious communication from Mr. Thomson Hankey appeared in the *Times* on Wednesday:—



My attention has been called by a gentleman well known in the scientific world to a new use for sugar, which, at the present low price of that article, might be capable of being practically applied.

Experiments have recently been made proving that sugar is a valuable ingredient in mortar and cement, having strong binding qualities. Equal quantities of finely-powdered lime of a very common kind were mixed with an equal quantity of good brown sugar, with the addition of water, and the result was a cement of exceptional strength. This has been tried at Peterborough Cathedral, two large pieces of stone of the broken tracery of a window having been joined firmly together by sugared mortar. The severest test is joining glass, which gives no hold to mortar without the use of sand, and this has been successfully done.

The fact appears to be certain that sugar produces an extraordinary effect on lime when the latter has been allowed to fall into a fine powder and has been thoroughly slaked. Particles of unslaked lime would destroy the result, because

of their expansion, which would make the mortar lift. The sugar mortar thus made will be found, I believe, to be as good as Portland cement, and the only question, therefore, would be one of cost; and it is probable that Portland cement itself would be made much stronger by the addition of sugar. Treacle might have the same effect.

It is not necessary to mention in detail the numerous small experiments which have been made. It is a matter which any one can test for himself by joining bricks with Portland cement alone, and by joining others with sugar and water added to the cement.

The fact that cane sugar and lime form a definite chemical compound has long been known. It is used, indeed, for various purposes, and it may be hoped that the suggestion for its use as an ingredient in mortar may be turned to practical account by builders and cement manufacturers. It has been suggested o me that the use of sugar is the secret of the success of the old Roman mortar.

LIGHTHOUSE ILLUMINATION.

FOR many years past Mr. J. R. Wigham, of the firm of Messrs. Edmundson & Co., Dublin, has maintained that great advantage would be derived in lighthouse illumination by the use, in connection with his large gas-burners, of lenses of larger dimensions, and of longer focal distance than those heretofore used. At the suggestion of Mr. Thomas Stevenson, a lens of this kind has been constructed for experimental purposes. The public will be interested in now knowing that the Commissioners of Irish Lights, with the sanction of the Board of Trade, have determined to use eighteen such lenses for the new gas-light at Tory Island lighthouse, in the construction of which Mr. Wigham is now engaged. The lenses will be used in triform—that is, in three tiers, six in each tier. Each lens will be nearly 6 feet square, and will transmit to the mariner twice as much light as he can receive from any lens used at present. One of Mr. Wigham's large gas-burners, with an illuminating power of about three thousand candles, will be placed in the focus of each tier of lenses. The resultant beam will be equivalent to about four million sperm candles, proceeding from an illuminated surface about 18 feet in height and 6 feet in breadth. The adoption of this plan marks an advance in lighthouse illumination of immense importance, and will make the light of Tory Island by far the largest in the world. Mr. Wigham is also ordered by the Commissioners of Irish Lights to erect a powerful gas fog signal at that station, and these improvements which the Commissioners are effecting at Tory Island will be of incalculable benefit to mariners approaching the north coast of Ireland from the westward. The whole work is likely to be completed before the winter of next year.

INSTITUTE OF AUCTIONEERS AND SURVEYORS.

A MEETING was held last week at the City Terminus Hotel, Cannon Street, to form an institute of auctioneers and surveyors. The suggestion emanated from Mr. George Johnson Ottley, who proposed the establishment of the society with the following objects:—To protect the interests of auctioneers, surveyors, estate agents, appraisers, and other members of the profession, to provide certificates for duly qualified members, to apply to the Privy Council for a charter or an incorporation, to form a provident institution for the benefit of members of the profession, and to establish in London a club or hall "wherein social and literary accommodation of every kind will be provided to meet the requirements of provincial members when visiting the metropolis, as well as to meet the wants of London members." Mr. J. M. Klenck having been voted to the chair, and having briefly opened the proceedings, Mr. Ottley observed that they were more or less acquainted with his views of the objects of the proposed institute. In its early existence they must expect a certain amount of opposition. The Chairman said he did not think they need go into the question of opposition until they met it. Mr. Ottley, continuing, said he had sent out between 9,000 and 10,000 circulars, but he did not suppose that he had reached the whole of the auctioneers of the kingdom, though he had done his best with that object. Between 300 and 400 preliminary members had already joined. The Chairman then proposed a resolution to the effect that the society be called the Institute of Auctioneers and Surveyors of the United Kingdom, the details of the objects mentioned to be settled by a committee to be appointed at the meeting, who could report to an adjourned meeting. He had put in the words "of the United Kingdom," as they would thus make themselves the leading centre, and the local institutions to which allusion had been made could be admitted as affiliated members. He had long since felt that there ought to be such a society, and that

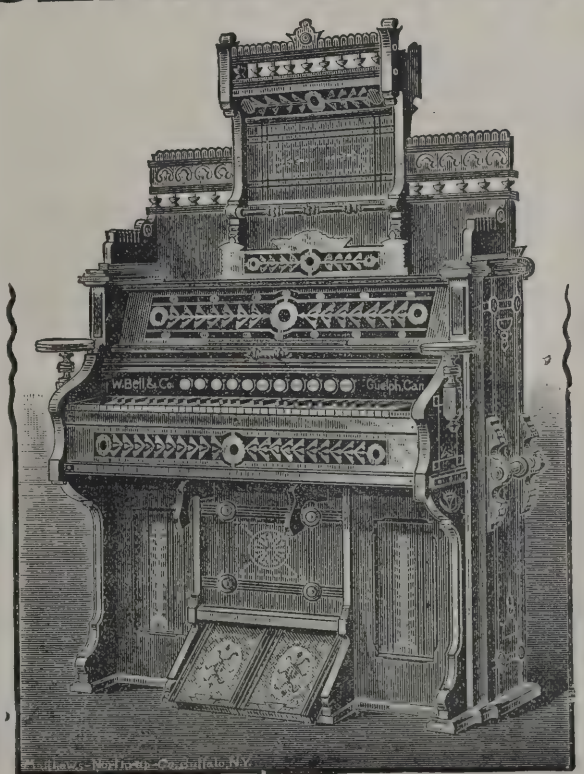
members of the profession ought to have a common place of meeting at which they could assemble at a specified hour. Very often those who required particular properties might thus easily find those who had them for disposal. A very large amount of correspondence would, in that way, be rendered unnecessary. If properly carried out he thought the institution could not fail to be beneficial to the profession. Mr. B. M. Bradbeer (Lowestoft) seconded the motion, which was supported by Mr. Abraham Smith. Mr. Joel proposed an amendment to add the word "Valuers" to the name of the society. The amendment, however, was not seconded, and consequently fell through. Mr. Kemsley referred to the existence of the Surveyors' Institute, which was formed twenty years ago, and had a Royal charter. He thought that that institution embraced all the objects which the proposed society had in view. The Chairman pointed out that the Surveyors' Institute was for surveyors, auctioneers not being admitted to membership unless they were surveyors. The resolution was carried after a short discussion, and subsequently a committee was appointed, with power to add to their number, "to arrange as to the preparation and settlement of the draft of the rules." A further resolution was also passed adjourning the meeting to December next.

THE CONSTITUTIONAL CLUB.

THE chimneypieces, stoves, &c., in the Constitutional Club are specially worthy of a word or two. Designed specially by the architect, Mr. Robert Edis, and carried out by Messrs. Yates, Haywood & Co., Limited, to suit the respective rooms, they are thorough works of art. Those for the coffee-room and morning-room are of pure statuary marble, inlaid variously with antique Sienna onyx and verd antique. Elegantly fluted double columns, with carved capitals, support friezes of garlands in the coloured marbles above described, and some idea of the weight alone of the shelves may be imagined when we mention that it took the combined power of eight men to lift one of them. Messrs. Yates, Haywood & Co. manufactured these beautiful chimney-pieces in their foreign works, partly in Belgium and partly in France. The chimneypieces in the smoking, billiard, card, and other principal rooms were also made from special designs, for the most part in white and yellow marbles. The stoves are, like those for the larger rooms, made by the same firm at their Rotherham foundries, and may be described as of Renaissance style, with canopies of brass and dogs of brass and metal combined. Hand-painted tiles of good design, and of a yellow tone, form the sides. It had evidently been the object of Mr. Edis to keep these chimneypieces and stoves light and bright, with just enough of colour to impart general warmth of effect. Bold in outline and massive yet graceful in detail, they might seem to have been brought from those grand old mansions in and around Whitehall, or from such well-known houses as Chesterfield House. Messrs. Yates, Haywood & Co., Limited, are, we understand, the contractors employed by H.M.'s Board of Works for our palaces, &c.; also by the War Department for barracks, &c., and by the Admiralty.

LOUDOUN HALL, ST. JOHN'S WOOD.

THE well-known house of Gillow & Co., in conjunction with Messrs. Russell, Harvey & Co., a young and rising firm, are about to sell by auction the above fine mansion, which covers about three acres of picturesque ground, together with the magnificent furniture and works of art, amongst which will be found one of T. S. Cooper's best productions, masterpieces by Sir Thomas Lawrence, Tissot, Schayer, Carlo Dolce, Weekes, and others; a suite of furniture for drawing-room, ebonised inlaid gilt and Amboyna wood, covered in splendid turquoise blue and silver brocaded silk, which cost some time back 600 guineas, and about 4,600 oz. of plate. The bronzes, which are very fine, deserve the attention of connoisseurs and lovers of the fine arts.



SINGLE-RAIL RAILWAYS.

THE Society of Engineers held its first meeting for the session 1886-7 last week, when a paper was read on "The Lartigue Single-rail Railway," by Mr. F. B. Behr.

The author commenced by observing that a single-rail line was not a new idea, as many patents had been taken out in that direction. Telford had suggested a single-rail line to be the correct principle, and Palmer in 1823 had endeavoured to make one in London but had failed, as had others since. Although narrow-gauge lines had been introduced, they only partially remedied the evil of the expense involved in construction, the works being similar to those of ordinary railways. Cable transport could only be used for short lengths of line, except

in very special cases, owing to its heavy cost, and in no case could it be made efficiently available for passenger traffic. The author then went on to describe the Lartigue single-rail system, in which the rail is carried on the top of A-shaped bearers or tressels, generally about 3 feet 3 inches high, but varying in height according to the level of the ground.

The vehicles are hung on the rail by vertical grooved wheels, and on passenger lines they have also horizontal wheels at the bottom on each side, which move along guide-rails fixed on the sides of the tressels, and prevent oscillation. The passengers sit back-to-back, as in an Irish jaunting-car. The experimental lines laid down near Victoria Street, Westminster, were then described by the author. The passenger line is worked by steam, and the special locomotive used was fully described. This line is constructed with very sharp curves and steep gradients, which are easily traversed and mounted, as may be witnessed any day. The author referred to several lines which have been constructed on the Lartigue principle on the Continent, notably one in the Esparto district in Tunis, which is worked by mules, and another in France at the mines of Ria, where electricity is the motive power. He also mentioned the experiments carried out in Russia by the Government for military purposes. The author finally described the Lartigue system as applied to overhead railways, supported on light columns placed in single line in the centre of the roadway in towns, for which purpose he showed it to be specially applicable.

THE ECCLESIASTICAL ART EXHIBITION.

THE Church Congress attracted crowds of clergymen and laymen to Wakefield, and what with the important discussions in the Congress Hall, and the recreative effects of the Ecclesiastical Art Exhibition, they were well entertained. This latter enterprise had for its object the display of church decorative art in its highest form, and although the firms exhibiting were not numerous, they were without exception well known and of good standing. The exhibition was largely patronised by visitors in the town.

Messrs. Jones & Willis, of Birmingham, were conspicuous for a large space filled with well-selected and high-class artistic work. In metal work this firm showed in photos specimens of wrought-iron screens erected at St. Luke's Church, Jersey, and St. Andrew's, Southport, noticeable for elegant design. A photo of a wrought-iron grille, placed in the Guildhall School of Music, was another attraction. The designs in wrought iron are correct in detail, and the workmanship is of superior quality. The lamp department was represented by the firm's patent "Hesperus" lamp, which is claimed to be of 45-candle power. The lamps are well adapted for the lighting of churches, two or three specimens in wrought iron being particularly effective. Pendants, brackets, and general gas-fittings were in large variety, both in brass and wrought iron. The brasswork exhibited upheld the firm's reputation. Eagles and other patterns of lecterns and memorial brasses were excellent in design and finish.

Carved woodwork also comes within the range of Messrs. Jones & Willis's work. This class was represented by a carved eagle and other lecterns, and photos of carved oak screen fitted in Ainstable Church, Carlisle, and carved stalls and pulpit for St. Philip's Church, Birmingham. Evidently the work has been done by a firm understanding the architecture which the decoration is to accord with. We must not omit to mention the art embroidery, which does no less credit to Messrs. Jones & Willis. Perhaps a better collection of ecclesiastical art has never been exhibited, or more thoroughly appreciated.

Messrs. Illingworth, Ingham & Co., of Leeds, exhibited a large variety of school furniture worthy of particular mention. The specimens exhibited are in the most modern and improved forms. It would be correct to say that, generally speaking, the firm excel in genuine improvements. There is "Ward's Improved Patent Reversible Desk"—a most ingenious contrivance, which forms either desk, table, or seat with back. The idea of the table transformation is a happy one—for schools are often used for tea meetings, &c.—and, with this improvement, no additional furniture is required. The ironwork is particularly strong, but the movements are easy. The wood is best pitch pine, well seasoned in the firm's timber yards, with an excellent varnish and finish. The "Leeds Dual Desk" is another speciality, which seems to have found great favour with School Boards, and amongst those adopting it are Bradford, Aston, Keighley, and Eccleshill. These dual desks are made in four different forms to suit requirements. The noticeable feature in the dual is that the seat works on hinges, and drops when unhinged, so as to allow passing in and out of the seats with convenience. A smaller specimen, intended for Kindergarten schools, was also exhibited. Box desks of all descriptions were well represented. The School Board desk is arranged to turn

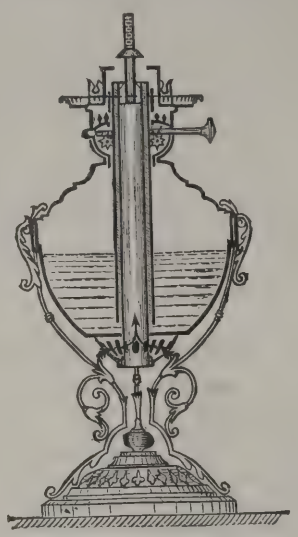
And so on to any amount.

In the transaction of speculative business Messrs. C., S. & Co. make no charge for commission or brokerage whatever unless their client makes a profit, when they take 5 per cent. of the profit made as their remuneration.

All transactions advised by wire as soon as completed. Monthly Circulars and Mining Reports post-free on application.

COLES, STEWART & CO., St. Stephen's Chambers, LONDON, E.C.



the seat in a perpendicular position. This gives every facility for drilling and marching. In short, every school accessory was shown. The goods are thoroughly well made, and look as suitable for a college as a Board school. We have introduced illustrations, showing the various specimens we have com-

mented upon. The exhibit was a good one, and too much praise cannot be accorded the firm for the quality of the material, the design, and the finish throughout.

Messrs. E. L. Luscombe & Son, of Exeter, were prominent in sculptured woodwork. We might particularise a rood sculptured in oak. The crucifix is ornamented with richly carved crocketing springing from the moulding which runs round its edges. The inscription at the base of the cross is, "Behold the Lamb of God!" and in the carved and traceried screens on either side are canopied and foliated arcades, in the central compartment of which, kneeling on carved corbels, are figures of angels in adoration. The screen on either side terminates with octagonal pedestals, the carved caps supporting sculptured representations of St. Mary and St. John. The whole has a thoroughly ecclesiastical tone, and the work seems to have been done *con amore*, and is correct in detail. There is not too much carving in it, it is elegantly simple, the figures contrasting well with the chaste ornamentation. Roods are still not nearly so largely adopted as they should be, and Messrs. E. L. Luscombe & Son are entitled to praise for their enterprise in making the rood a prominent feature of their exhibit. A prayer-desk, which is part of the series of choir stalls they have made for the church of Monkton Wyld, in Dorset, is a specimen of rich yet delicate carving, thoroughly neat and natural. Lecterns in oak and walnut were also conspicuous, as well as credence tables, carved alms dishes, &c. A series of bosses for the roofs of churches were examples of each period of Gothic architecture. The exhibit was thoroughly worthy of attention, and accorded with the reputation of the firm for high-class work.

The only exhibit entirely of lamps was that of the Defries "Safety" Lamp Company, Limited, conspicuously represented. Safety is the key to this ingenious invention. It was certainly an urgent requirement, for no lamp we have ever heard of has claimed absolute safety before. The main principle of this patent is that the oil is poured into a tubular-created receptacle,

over which a tube fits, thus rendering an overflow of oil impossible. Hence, in case of accident, the lamp being overturned, say, the oil is safe within the two enclosures, and no light can reach it. The fact that insurance companies, Captain Shaw, and Mr. Boverton Redwood recommend it as absolutely safe, give these claims high authority. This speciality is also claimed to give a purer and stronger light than any in use. The construction of the lamp insures combustion at all points of the flame, and may be lowered to any extent without losing its brilliancy. Mr. Boverton Redwood, as chemist to the Petroleum Association, in his report on the Defries Safety Lamp, after an analysis of the burning power, says, "These results are more favourable than any I have hitherto obtained

THE BEST

FOR TONE, TOUCH, GENERAL FINISH, AND GOOD VALUE.

Wholesale and Retail Depot :—London, 211 Regent Street, W.

The Celebrated "DUBOIS" Hydraulic Drawn Lead TRAPS and BENDS.

The above Shapes and Sizes always in Stock, and we are prepared to furnish SPECIAL SHAPES to order at short notice. These justly celebrated TRAPS are made from Pure Pig Lead by Hydraulic Machinery after the manner of Lead Pipe, and have peculiar advantages appreciated by every Plumber. They are greatly superior to either Cast or Hand-made Traps, as they have no SEAM, are of UNIFORM THICKNESS, PERFECTLY SMOOTH INSIDE AND OUTSIDE, and can be FLANGED, PLUGGED, and STRETCHED, without fear of SPLITTING. No possibility of Sandholes.

FOR PERFECTION OF MANUFACTURE THESE GOODS ARE PRE-EMINENT.

For Sale generally by the principal Lead Merchants and Wholesale Dealers in Plumbing and Sanitary Appliances throughout Great Britain and Ireland.

DUBOIS MANUFACTURING CO., LONDON AND NEW YORK.

London Office and Works :—15 BRITANNIA STREET, KING'S CROSS, W.C.

with any mineral oil lamps of other forms." A practical test at the exhibition goes far to support this assertion. The style the lamps are made in is of the best description, and their introduction in Wakefield seemed quite a success.

Messrs. Benham & Froud exhibited a handsome collection of lecterns in eagle and other patterns; chandeliers and brackets and general fittings; also a particularly effective variety of embroidered textile work. The name of the firm is well known for the excellence of their work. It is sufficient to add that the exhibits agreed in every respect with it.

Messrs. Mayer & Co., of Bond Street, London, exhibited a reredos representing the Lord's Supper, magnificently sculptured. The work was of the most elaborate character, and correct in detail. The depth of the carving was particularly noticeable. A stained-glass window—indeed, the only conspicuous one in the building, the subject being the Sermon on the Mount—was particularly rich in colour and able in design.

Messrs. Brindley & Foster, of Sheffield, exhibited an admirable organ on their tubular pneumatic system.

NOTES ON NOVELTIES.

Temporary Electric Lighting.—Pollak's self-charging battery, requiring no attention, is a novelty introduced by Messrs. G. Binswanger & Co., of 5 Great St. Thomas Apostle, Mansion House, E.C. This speciality has been devised especially in view of affording an easy means of utilising electric light for domestic purposes, electric light being in regard of health, safety, and comfort so adapted above all other illuminants for the house. But where electric light is required on a small scale for a few lamps, or even for a single lamp alone, dynamo machines are impractical, and recourse must be had to primary batteries. Now, the use of dangerous acids in primary batteries, the trouble of recharging them, cleaning them, &c., may be undertaken by those willing to give the constant attention necessary; but there is no need of being burdened with this trouble, or with employment of these acids, if the Pollak battery is used, for this battery requires no attention whatever for months or years, as the user need not recharge the battery for a long period, or even he could, without being inconvenienced, arrange with the supplier to attend to the recharging at a reasonable cost.

Pollak's self-charging patent battery is not, it is true, constructed to supply a constant light or to supersede gas, but in many cases where an immediate, convenient, safe, and beautiful light is required for short periods it will supply a great want, as for such purposes each charge of the battery can be made to last for years without attention. The arrangements, size, or number of the cells of the battery and the necessary accessories—as lamps, switches, instruments, &c.—can be varied according to the different purposes for which the battery is required. To mention, for example, a few uses:—In private houses, as night light, reading-lamp, temporary illumination of cellars, staircases, offices, stables, gardens, &c., more especially in country houses. For the professions, for physicians, dentists, &c., as a constant source of electricity for light and motive power. For photographers, as a convenient illuminant for dark rooms, and as a source of ventilation and drying. For banks, as an illuminant for strong rooms, &c. For business people, as an illuminant for such rooms in which a naked light is dangerous or inconvenient, such as wool, cotton, gunpowder magazines, lighting show-cases, or as an advertisement. In theatres for safety lamps, and scare against burglars.

To enter now into details, we will describe the electric night light, of which we append a drawing. It consists of six cells (*a*) in a cupboard, (*d*) the switch, (*c*) lamp, (*b*) with bracket and shade, which gives to the light an agreeable subdued tone. This lamp will burn for eight hours, giving the light of about two candles. The battery recharges itself during the day, and the light will be ready the following night for eight hours. In this way the night-light will burn for months without attention. The consumption of materials is extremely small, and consists only of sal ammoniac and zinc, costing about one-sixth of a penny per hour.

In the combined night-light and reading-lamp the number of cells required for the installation depends on the amount of light required. For a 5-candle lamp 18 cells are required. Such a lamp will burn for about six hours, after which time the battery will require rest. The user requires but to attend to the switch; if the light is not required, the switch must turn to R (rest); if the night-light is required, turn to N (night); if the lamp is required, turn to L (lamp). The cost of maintenance of night-light requiring only six cells is one-sixth of a penny per hour.

Temporary automatic light on staircases or in rooms is arranged as follows. The action of opening a door or pressing a knob will illuminate a room or hall for a few minutes, after which the light will be extinguished automatically, in order to

FRENCH LIBRARY OF ART.

JUST PUBLISHED. Handsomely bound in Cloth, Broché, 24*s.*; Relié, 28*s.*

LES STYLES.

OVER SEVEN HUNDRED ENGRAVINGS OF DIFFERENT PERIODS, WITH DESCRIPTIONS.

BY PAUL ROUAIX.

"This large and sumptuous book is issued by the publishers of *L'Art*, a journal which we have frequently referred to as being one of the best publications of its kind in Europe. The French Librairie de l'Art has been known for long in connection with works treating of the fine arts, and *Les Styles* is certainly equal to anything we have ever seen of the kind, and by far superior to the vast majority of similar works issued in this country. There is something about the atmosphere of France which confers refinement of taste in everything relating to designs, and so pronounced is the national aptitude for discovering beauty and symmetry, that the very fact of a book coming from across the straits is generally a sufficient guarantee of the artistic excellence of the contents.

"M. Rouaix treats of many species of decoration, commencing with that in vogue amongst the ancient Egyptians, and proceeding in regular order of date with the Etruscan, Greek, Byzantine, Roman, Gothic, the peculiar ornamentation of the Renaissance, and of the times of Louis XIII., XIV., XV., and XVI. Before each division the author introduces a short historical introduction, and afterwards, by means of a series of beautifully executed prints, illustrates the prevailing fashion of the time. For this purpose he has levied contributions on examples of architecture, carving on wood, suits of armour, bas-reliefs, tapestry and embroidery, mural painting, mosaical work, and a host of other subjects, including caskets and chalices. In fact, anything that can be called artistic and assigned with certainty to a particular era is represented, the result being an exhaustive and exceedingly pretty production."—Book Lore.

insure against loss of battery power, which would happen if the turning of the switch were forgotten. This is accomplished by means of a door trigger, specially patented for this purpose,

which can be placed out of use during the day by a lever. This arrangement can be extended to act all through the house by means of a central combined apparatus and the necessary electric wire circuits, which have been especially manufactured and patented for this purpose.

The advantages of the Pollak battery over other batteries already mentioned, render it perhaps the only battery by which a temporary light can be obtained without inconvenience and at a small cost; but it is also suited for telegraphy, telephony, signalling, and similar uses.

For closed circuits, Daniell cells are mostly used, but Pollak's Self-charging Battery must be much cheaper, as it takes its depolariser from the oxygen of the air.

For open circuit, especially for telephony and signalling, the battery most in use for this purpose is the Leclanché, in which there is waste of zinc to a large extent; the depolarising electrode (whether in porous pot or agglomerate) is useless after some time, and the creeping of the salts is a great inconvenience. The Pollak cell suffers from none of these disadvantages. The zinc, being wholly immersed in the fluid, is entirely used up, the carbons are lasting, and the exciting fluid only requires renewing.

Each cell in the Pollak battery consists of a glass jar, at the bottom of which is the zinc electrode; the other electrode is carbon, made by Pollak's patent process, which insures great porosity, a large surface, and at the same time good conductivity. The lower part of the carbon is plated with copper, or in some cases a small piece of copper wire is suspended in the fluid and connected to the carbon. The zinc of the cells for lighting purposes is covered with sand, and the exciting solution is sal ammoniac dissolved in water. When thus charged the action of the battery is twofold. First, there will be set up a local action between the carbon and copper, which causes the reduction of part of the charging fluid and produces combinations of copper; for instance, in case of sal ammoniac, chloride of copper is produced, colouring fluid blue and forming the depolariser of the battery. Now, when the outer circuit is closed the action is that of a carbon, zinc, sal ammoniac battery, the nascent hydrogen reduces the copper chloride to copper, which is again tranformed into copper chloride. Thus the battery constantly forms its own depolariser, *i.e.*, it recharges itself, and therefore such a battery is one of the most constant known. As will be readily understood this battery depends largely on gravity, both to prevent local action on the zinc and capillary attraction; it is therefore essential that the quantity of copper solution should be regulated, and also that the cells be not moved or shaken. The Pollak battery is now in practical use in Germany and Holland, and

has quite achieved the success which was expected during its trial state, and been very favourably received.

The Atlas Telephone.—Mr. James Fraser, of the Atlas Works, Tenter Lane, Leeds, has introduced a novelty in telephone apparatus, which will considerably simplify matters as to cost, and enhance the sound carrying power in telephony. The idea suggested itself to Mr. Fraser, the inventor, that if the musical sounds produced by a brass band can be heard five or six times as far as those produced by a string band, that a telephone made of metal would be five or six times more sensitive than one of wood. On this theory an instrument has been constructed by Mr. James Fraser, of brass, which, after many experiments, has developed into "The Atlas Telephone," one of the most sensitive and ornamental instruments of the kind which has yet been offered to the public.

The illustration represents an elevation of the Atlas Patent Telephone. It is worked entirely on acoustic principles, and

has been constructed with a view to meet the great demand for a cheap and reliable method of communication between places where the distance is too small for an electrical telephone, and to entirely supersede the old-fashioned speaking-tube. A diaphragm, or web of fibrous material, is bolted between two concave metallic plates. To the front plate is fitted a neat bell-shaped mouthpiece. At the back is fitted a circular sounding box, which, with the diaphragm case, is fitted to a large ebonised wood plate by means of three metallic legs. In fixing a set of telephones a steel wire is attached to the centre of the diaphragm by means of a metallic button, behind which is a steel distributing plate to relieve the strain on the diaphragm itself. The line wire is then taken along special spring insulators round the various angles and corners, and attached to the centre of the distant instrument. Care must be taken that the wire touches nothing but its insulators from one end to the other. Attention is attracted by tapping the diaphragm, or in certain cases when specially required by means of an electro-magneto-bell. This tap or bell can be heard a considerable distance away from the distant telephone. On receiving a reply, conversation can be carried on at once. All the metallic parts are plated with nickel silver, and the diaphragms are coated with either red or blue enamel. The inventor is now bringing out a smaller telephone for domestic purposes, to take the place of ordinary bells, thereby effecting a saving of time and labour to the domestics. This small instrument aids communication between the dining-room, drawing-room, and bedrooms and the servants' hall, so that messages can be passed to the servants in such a manner as to obviate trouble and loss of time involved in unnecessary journeys up and down stairs. The larger instruments are adapted up to distances of three miles; of these several are working and giving great satisfaction. A short account of a long and short-distance telephone will give the reader some idea of the satisfactory way in which they work.

A long-distance telephone can now be seen working at Mr. Richard Nichols', Hill Top, Bramley, near Leeds, a distance of one mile. The line is from his farm to his house, and is carried along on seventeen poles placed at equal distances apart, and the wire is carried along these on special fixings attached to the poles.

A short-distance telephone can be seen working at Messrs. Hollands & Co., machine brokers, Kirkstall Road, Leeds, a distance of about 70 yards, from their office to their show-room. The line is carried from the office along the outside wall and across the yard, into the show-room, where it is carried along the ceiling perpendicularly down to the other instrument, which is fixed upon a wooden pillar in the show-room.

Mr. Fraser claims that the "Atlas" is an improvement on the ordinary telephone, and that he has kept especially in view the requirements of architects. The instrument has been under our inspection, and we can certainly recommend it as combining every improvement with high finish and workmanship.

The designing and construction of pumping machinery for deep wells demands no small care and experience if the work is to be not only effective, but durable. The arrangement ought to be adapted to the circumstances of the height of lift and work to be done, and the leading firms in this line of engineering are careful not to fall into the error of tying themselves to one design for all situations. We are able to illustrate an arrangement designed and constructed by Messrs. Hayward, Tyler & Co., of Whitecross Street, London, for performing

heavy duty at one of the Government military stations. The design of the pumps and driving gear is a very good type, the result of much experience in this special line of work for which this firm has long been well known. A very similar arrangement has been successfully used by them for exceptionally heavy work with very large pumps. The pumps in the present case are driven by one of their tube-girder engines with variable expansion gear, occupying little space, and very economical in steam. Our illustrations will show the action of the pumping machinery.

BRADSHAW'S LIMMER ASPHALTE

Messrs. BRADSHAW & CO., being Sole Agents in the United Kingdom for, and possessing proprietary rights in, the Freehold Mines of the German Asphalte Company (of which Mr. C. W. Bradshaw is also a Director), situated at Limmer, near Hanover, and Vorwohle, Brunswick, possess special facilities for reliable and prompt delivery of their celebrated "LIMMER ASPHALTE" at low rates, either for sale in its natural state or ready for laying by their own workmen in any part of the United Kingdom. EACH BLOCK supplied from these Mines, besides bearing the impress of the Company, is stamped with the words "BRADSHAW & CO." The attention of Architects, Engineers, &c., is particularly called to the fact that the "LIMMER ASPHALTE" is especially suitable for use in the construction of Reservoirs, Roofs, &c., where water-tightness is extremely essential. For such purposes **Over 2,000,000 (Two Millions) of Square Feet of "Limmer Asphalte"** have been executed by Messrs. BRADSHAW & CO.; while for Paving purposes **Over 50 Miles of "Limmer Asphalte" Footways** have been laid by them in the LONDON DISTRICT ALONE. Messrs. BRADSHAW & CO. will be happy to forward Prices, Samples, and Testimonials, and give all information on application to:—

R. ADAMS,

17 BLACKMAN STREET & 7 GREAT DOVER STREET, LONDON, S.E.,

INVENTOR and PATENTEE of the

SAFETY WINDOW WITH REVERSIBLE SASHES

FOR INEXPENSIVE AND PERPETUAL CLEANLINESS,

Which has gained at the INTERNATIONAL HEALTH and SANITARY EXHIBITIONS

Two Gold, Four Silver, and Four Bronze Medals, and Sixteen Diplomas of Merit.

IMPORTANT NOTICE.

The Patentee has been advised by several of his friends to form a Company for the Manufacture of the above-mentioned Sashes in larger numbers, for the supply of the Trade and for the Home, Colonial, and Foreign Markets. Hitherto he has only supplied the Fittings, except under very special circumstances. He now proposes to manufacture the Sashes complete with Fittings.

Provisional Protection has just been granted for another Patent, whereby the Sashes will be greatly reduced in price, and, consequently, brought within the requirements of every Architect and Builder.

If any of the readers of this journal wish to receive further particulars or to take Shares in the proposed Company, they are requested to make early application to the Patentee, as it is expected that the larger number of the Shares will be privately subscribed.

Applications for Shares will be taken in the order in which they are received.

OF
ARCHITECTURAL APPLIANCES,
10 Baker St., Portman Square, W.
WM. & F. BROWN & CO'S. Patent Wood Mosaic, a first-class floor for the interior of mansions, warm, noiseless, durable, and artistic.
Applications for Space can now be made to the Manager,
S. S. PHILLIPS.

FIREPROOF FIXING BLOCKS
FOR WALLS AND FLOORS
(Wright's Patent). Wood Joint Pieces, Plugs, Fixing Fillets, Grounds, &c., successfully superseded without extra cost. Extensively used by Leading Architects and Contractors for several years past; H.M. War Department, &c.
NOTE.—These Fixings take and RETAIN nails equal to wood They never burn, decay, shrink, or become loose, and will carry any weight that can be put upon them in a building.
Colonel W. J. STUART, Commanding Royal Engineers, Chatham, writes:—"The frames are most strongly fixed, and the blocks did not split with the 5½ in. screws that were used."
Write for new catalogue, containing full particulars and references post free.
"Highly Commended" at the Firemen's Exhibition, May 1886.

Naphill, High Wycombe.

VOLUME XXXV. OF THE ARCHITECT,
Handsomely Bound in Cloth, Gilt Lettered, price 12s. 6d.
Office: 175 Strand, London, W.C.

GRUNDY'S PATENT
WARM-AIR
VENTILATING FIRE GRATE.
The novelty, superiority, and advantage of this patent consist in the heating surface being greater than any other Fire-grate introduced to the public. It is very simple in construction, and is made in the form of a Stove, the back of which is semicircular in shape, with gills behind and smoke-nozzle on top, all cast in one piece. The same can be attached to any design of a Register or Stove front. It is very suitable for schools, class-rooms, waiting-rooms, hospitals, offices, dormitories, and dwelling-houses, from the cottage to the mansion. Design and specification post free on application.
TESTIMONIALS.
"9 Victoria Chambers, Westminster, S.W.: June 10, 1884.
"SIR,—I have much pleasure in testifying to the efficiency of your patent warm-air fire grate. It has been very successful, and given every satisfaction where I have used it. Yours, &c.,
"To Mr. Grundy. JAMES WEIR, F.R.I.B.A."
"6 John Street, Bedford Row, W.C.:
"December 16, 1885.
"DEAR SIR,—I have now had an opportunity of testing your patent grate, and am glad to be able to say that I am most agreeably disappointed, because, as you are aware, I was rather sceptical about its powers when you showed it to me; but now I can say it answers admirably, and heats abundantly my porch-conservatory.—I am, yours truly,
"To Mr. John Grundy." "R. S. LANDER, F.R.I.B.A.
From James Garry, Esq., Architect, West Hartlepool, July 1884.
"DEAR SIR,—I have very great pleasure in stating that the first stove, or patent warm-air ventilating fire grate, adopted by me in school at Seaton, and a second in a Cocoa Palace, have given such satisfaction that I now order eleven to be inserted in New Upper Grade Schools in course of erection at West Hartlepool. They are the most economical, efficient, and easily managed stove at present before the public.—Mr. John Grundy."
From Hon. and Rev. G. G. C. Talbot, M.A., Withington, Cheltenham.
"DEAR SIR,—You will be gratified to hear that the school is completely warmed by your new grate. It is the most economical and efficient that I have ever seen.—Mr. John Grundy."
Society of Architects, Architectural and Building Trades Exhibition, 1885:—"5 Great James Street, Bedford Row, May 1.—The warm-air ventilating grate shown by Mr. John Grundy at Stand 75 Floral Hall, is an admirable contrivance for utilising the heat conducted through the back and sides of the stove, for warming schools and buildings by a supply of freshly warmed external air."
Apply to JOHN GRUNDY, 30 Duncan Terrace, City Road, London.—Works: TYLDESLEY, near Manchester.
Agent for Scotland, SEPTIMUS HARPUR SMITH, 1 Upper Gilmore Place, Edinburgh.

TRADE NOTES.

THE bells used at the Leeds Triennial Musical Festival, which have received so much praise from Sir A. Sullivan and others, were produced at the foundry of Messrs. Warner & Son, of London.

WE are informed that a gold medal has been awarded at the Liverpool Exhibition to Messrs. M. C. Duffy & Son, of Storks Road, Bermondsey, S.E., for their patent Immovable Acme Wood-Block Flooring.

MR. JOHN GRUNDY, of Duncan Terrace, Islington, has just received a commission to heat Truro and Derry cathedrals.

MESSRS. T. LAWRENCE & SON, of Bracknell, supplied the bricks for the Roman Catholic Church, High Road, Chiswick, which, from their colour and quality, impart distinction to the building.

THE Mayor of Sheffield opened a Mechanical and General Trades Exhibition, on Tuesday, the object of which is to stimulate local industries by bringing together in an attractive way the various productions of the district.

OFFERS will be selected at the meeting of the Commission of Supply next week, at Inverary, for the erection of a Court House in Oban. Mr. D. C. Macintosh, of Oban, is the architect.

A NEW annual, to be called the "Architect and Contractor's Compendium," will be issued early in January next by Messrs. Sears & Sons. The prospectus states:—"Its design is to combine in a convenient form legal and general information, tables, and memoranda of every kind, relating to the theory and practice of architecture." It is likely to be a very useful work to architects and builders.

A REPORT on the forests of Bosnia, published in the *Moniteur Officiel du Commerce*, calls attention to the facility with which manufacturers of wooden articles may procure magnificent timber from this new province of Austria at a very small expense. The difficulties of transport, though still considerable, are decreasing year by year, and this expense is already more than counterbalanced by the extreme cheapness of the wood on the spot. Most of the Bosnian forests appear to be owned by the Austrian Government.

THE season is now approaching when damp walls begin to prevail, and consequently it becomes necessary to take preventive measures. An effective remedy is damp wall paint. It is non-poisonous, free from smell, and perfectly harmless, and is guaranteed to dry in a few hours after its application. This wall paint, which is impervious to damp, is of a chocolate colour, and can be papered over, or any lighter colours can be painted over it. The proprietors, Messrs. H. Thompson & Co., of 242 Old Street, London, also manufacture magnetic oxide of iron paint, for preserving iron, wood, stone, brickwork, or, in fact, any substance, for exterior or interior construction and ornamentation.

THE Swedish *Göteborgs Handelstidning*, of September 14, complains of a steady decline in the demand for Swedish iron in the English market. For Swedish cast iron of the finer quality there is no longer any chance in England. It declares that hardwares exported to that country are returned unsold, even though offered at the very lowest prices. The East Indian market is almost as completely closed against Sweden, and such sales as have been made there have been effected at a ruinous loss.

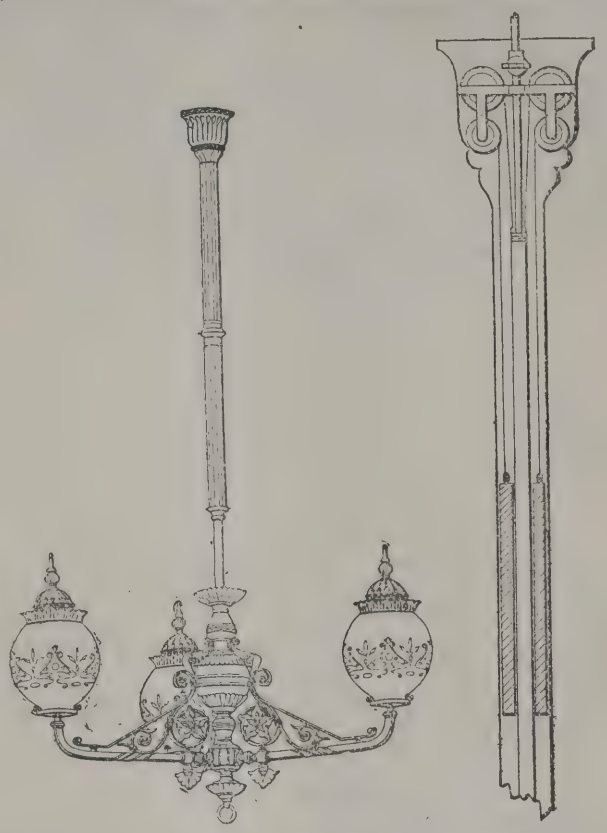
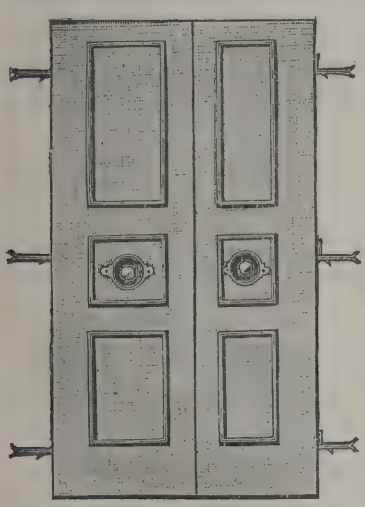
A. R. CONSTANTINE, 61 FLEET STREET, E.C.



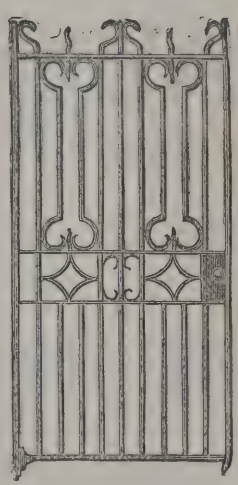
N.B.—Judges have conferred Greatest Honours, Highest Awards, Gold and Silver Medals at all Competitive Exhibitions. ESTABLISHED A QUARTER OF A CENTURY.

Mr. Thomas writes to us from Exeter :—I am pleased to see that Government and many other large firms are adopting the principle of dividing their contracts to the various branches of the building trade. No doubt it would show a large saving if railway companies were to adopt this system, with their maintenance especially.

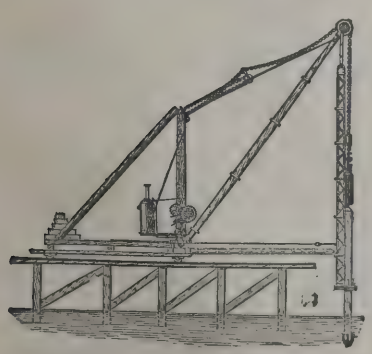


In giving out the contracts for the Birmingham Cable Tramway between Colmore Road and Hockley, a peculiar incident occurred, because the contractors, the Tramway Company, found the price of steel rails of German manufacture was about 500*l.* less per 1,000 tons than those of English manufacture. The Tramway Company, in desiring to forward the wishes of the Public Works Committee to use materials of home production, have arranged terms with the Barrow Hematite Steel Company for supplying the rails. The contract, which has been placed with the Barrow Company, represents the first of the three sections into which the tenders were divided, and comprises the ordinary girder section rails, and the necessary fish-plates. The schedule of prices, as sent in by Messrs. Tangye Brothers, Soho, has been accepted for the supply of the ironwork, comprising over 250 tons of the iron yokes for cable tube, wrought-iron tie-bars, bolts and nuts, washers, angle and tee iron, rolled iron girders, malleable iron pulleys and frames, inspection hatches and frames, side entrance doors and frames, crucible steel points for tramway and slot rails, crossings, &c. The contract for laying the lines is taken by Mr. Jacob Biggs, of Handsworth.

NOTES ON NOVELTIES.



Stanley's Patent Secret-Balance Chandeliers. — This patent is an immense improvement on the clumsy apparatus so long in use for raising and lowering chandeliers. It is distinctly an advantage to be able to dispense with the unsightly and no doubt often dangerous paraphernalia of weights and chains, &c., of the too conspicuous pulley arrangement. In the Stanley patent secret-balance chandeliers, as may be divined from the name, the usual ugly balance-weights are entirely dispensed with, the balance-weight being, in this improvement, a leaden tubular weight which just slides softly over the inner or ordinary hydraulic tube. This tubular weight, and all chains, machinery, &c., connected with it, are covered by an outer tube or casing, which is made of ornamental design to suit the chandelier, or for æsthetic surroundings it may be draped in plush, or other material in any style to fancy. The covering tube prevents all vibration and noise present in movement with weights, and secures the weight and chandelier from accidentally falling ; it also guides the inner tube so as to permit of a



stuffing-box being used, instead of the ordinary hydraulic arrangement (which is a constant source of annoyance), with perfect security against escape of gas. The tubes in this case are rendered non-corrosive by nickel-plating. As loose swing-

ing weights and chains, which are always liable to twist, are dispensed with, the stems of these chandeliers may be made of any length for lofty halls and public rooms, and in such cases would permit the chandelier to be pulled down nearly to the floor to light, or dust and clean the globes. The covering of metal-work over the wheels, which is of ornamental design, forms, by openings pierced through it, convenient and elegant means of ventilation. By a patented arrangement these chandeliers can also be perfectly adapted for electric lighting, candles, or oil lamps, and can be fitted to any chandelier in place of the ordinary weights, &c. Among other purposes, the

patent is also admirably suited for billiard lights. The accompanying illustrations will explain themselves. The new style of chandelier is seen slightly lowered. The interior construction is shown in another, and a third shows the arrangement for ventilation. Mr. H. T. Tallack, of 28 Hatton Garden, E.C., is the sole agent for the patent. The chandeliers may be had of any gas engineer, and the patent may be fitted to chandeliers already in use.

SACCHARINE MORTAR.

SOME further correspondence on this subject has appeared. Surgeon-General Cornish says:—In India the practice of mixing "jaggery," or unrefined sugar, with mortar in certain proportions is a very ancient one. In the latter part of the last century, when Hyder Ali's horse threatened the settlement of Madras, the townspeople were called upon to build up a wall to keep the intruders at bay. This wall existed until 1859, when Sir Charles Trevelyan, the then Governor, had it removed with the view of bettering the sanitation of the town, and providing for its extension. But so firmly was the brickwork held together that the greatest difficulty was found in the demolition of the town wall, and the separation of the bricks from the mortar was quite impracticable. In examining some old records about fourteen years ago I came across the original specification of the Government for the composition of the mortar with which the town wall was to be built, and the specification included a certain proportion of "jaggery" to be mixed with the shell lime and river sand. I sent the recipe to the *Madras Mail* newspaper, in which it was published, I think, in 1873. The polished "chunam" walls, for which Madras is famous, are prepared with cement made with unrefined sugar. Mr. Nathaniel Stevenson says:—From personal experience I can confirm the statement that sugar has a wonderfully hardening influence if mixed with lime. I have used about an ounce of brown sugar to a half-pint of the water used in making plaster-of-Paris models. These models are certainly smoother and much harder, and therefore far less liable to damage than others. I find this is of special advantage in working vulcanite, &c.

ENGLISH COMPETITION ABROAD.

THE English Consul-General at Frankfort-on-Main in his last report, says:—

I feel it my duty to bring a fact before the notice of British manufacturers, with which I was just acquainted by a friend of mine, an English resident of this city, well informed of the state of commerce at home. A few years ago an important gas company in this district, after issuing tenders for a telescopic gas-holder 90 feet in diameter and 25 feet in depth, received twelve tenders, of which seven were from English and five from German firms. The prices of these latter firms exceeded by far those of the English competitors, and the gas-holder was ultimately supplied and erected by one of the English firms, whose tender, though they had to pay 350*l.* for duty and freight, was still 440*l.* lower than the cheapest German offer. The importance of such a fact cannot be over-estimated, as it leads to the conclusion that if English manufacturers would but do their utmost to make themselves known in foreign

The Celebrated "DUBOIS" Hydraulic Drawn Lead TRAPS and BENDS.

The above Shapes and Sizes always in Stock, and we are prepared to furnish SPECIAL SHAPES to order at short notice. These justly celebrated TRAPS are made from Pure Pig Lead by Hydraulic Machinery after the manner of Lead Pipe, and have peculiar advantages appreciated by every Plumber. They are greatly superior to either Cast or Hand-made Traps, as they have no SEAM, are of UNIFORM THICKNESS, PERFECTLY SMOOTH INSIDE AND OUTSIDE, and can be FLANGED, PLUGGED, and STRETCHED, without fear of SPLITTING. No possibility of Sandholes.

FOR PERFECTION OF MANUFACTURE THESE GOODS ARE PRE-EMINENT.

countries, either by travellers thoroughly acquainted with the language of the country they visit, or by means of advertisements in the special papers devoted to each industry, they might easily open up new channels to their industries, and successfully struggle against and overcome the depression of trade and commerce.

A WARNING TO BUILDERS.

At the Wandsworth Police Court on Tuesday, Mr. John Miller, a builder, of Clapham, was summoned for using armorial bearings, and keeping a man servant without licenses. Mr. G. F. Bell appeared for the defendant, and said he would plead guilty in the case of the armorial bearings, but not in the other. An excise officer said he saw the defendant driving a trap which had a crest and motto upon it. The defendant told him that he purchased the trap with the crest upon it, and that he employed the man as groom and to work in the garden. Mr. Bennett, a magistrate, observed that it had been held that a man cleaning boots and shoes came within the Act. Mr. Bell said the man was employed as odd man in the buildings. He called the man, who said he was employed to look after the trap and to make up his time in the buildings. Mr. Bennett said the defendant had rendered himself liable to 40*l.*, being 20*l.* for each offence, and until recently there was no power to reduce the penalty. In the case of the man servant he imposed a fine of 3*l.*, with 2*s.* costs, and in the other 20*s.*, with costs.

A NEW PETROLEUM ENGINE.

On Monday afternoon a number of gentlemen visited the works of Messrs. Priestman Brothers, Holderness Foundry, Hull, to attend the trial of a patent engine, the motive power of which is obtained from the use of common petroleum. These engines are made under Messrs. Eteve & Hume's patent and are extremely simple in their internal arrangements. The petroleum is stored in a small tank containing one to two days' supply, as the case may be. A small pressure of air is put into this tank and the petroleum is forced out of it into a vessel in a vaporised condition, in which it is then drawn into the cylinder by the outstroke of the piston, and having been compressed on the instroke the charge is ignited by means of a small electric spark. This immediately explodes the contents in the cylinder, and the piston is driven forward. The engine, in which the highly-refined petroleum is used, is very similar to that in which the common petroleum is employed, the only difference being that in the latter engine the oil is taken into the cylinder in a heated condition. The cost of the oil is estimated at a halfpenny to three farthings per indicated horse-power per hour. Four horizontal engines were at work, two with benzoline and two with common petroleum. One of about three and a half indicated horse-power, supplied with benzoline, was driving easily four blasts at which chain-makers were at work, besides a punching and a shearing machine. A vertical engine of about four horse-power was driving a tram car, and doing work with ease. The tests were considered most satisfactory.—The *Times*, October 13.

THE FATAL ACCIDENT IN KILDARE.

It will be remembered that on the 5th inst., the Very Rev. J. B. Kavanagh, D.D., was killed on the steps of the altar of the church by the fall of a figure of an angel. The following evidence given at the inquest by Mr. W. Hague, architect, is interesting, and may serve as a warning to the erection of similar figures :—

Mr. Hague said : I am an architect by profession, and was employed by Dr. Kavanagh for various works, the house in which the Christian Brothers live, the school and works in connection with the church, except the altar in question. I was not the architect or designer of either of the three altars erected in the church. But, previous to Dr. Kavanagh making the contract for these altars, I had supplied him with several designs for altars in accordance with the style of the church. For the designs that I supplied him with, I obtained tenders in the usual way from parties in the trade. Dr. Kavanagh considered these estimates all ran too high. The lowest, as far as my memory serves me, was 900*l.* ; that was a sum far beyond his ideas. As far as I was concerned I heard no more about the altars for a considerable time, it may be a year. It was certainly several months. One day Dr. Kavanagh came into my office, and appeared to be in very good humour, and said that he had succeeded in obtaining a tender for 600*l.* for three altars and the communion rail, all in marble. I asked him upon what basis or data he obtained the

tenders, as I had not supplied him with any designs from the ones formerly supplied, and which he rejected on account of expense. He immediately replied :—"I have been going all through the city churches looking where I could find altars that pleased me, and at last I found them in St. Joseph's, Berkeley Street." I immediately said, "But St. Joseph's, in Berkeley Street, is a very ornate Gothic structure, and the altars are not in keeping, and it will be totally out of place in your church, as it is a totally different church." He laughed, and said, "I am not bound by any architectural rules, and the chances are I will go to America some day, collect funds, and build a church to suit the altars." I then asked him who was the party he had dealt with for them, and he immediately replied, "Mr. Ryan, of Dominick Street ; and Mr. Ryan," he said, "is here, and I will ask him to come in and see you." The meaning of that was that we should have a general conversation upon it, I being in the position merely of having a friendly chat with Dr. Kavanagh, having no professional connection with the matter. I asked Dr. Kavanagh, "Has Mr. Ryan got the class of men to do that class of carving?" because there are certain houses known to us where, when we give an order, we know the thing will be done by experts. I asked the question, and Mr. Ryan expressed a wish to employ such men as I knew could do that particular class of carving—that is, the carving of the panels. I heard no more until one day I was passing Mr. Ryan's place, and I turned in and asked him what he was doing for Dr. Kavanagh. He said, "I am getting on very well," and he showed me a couple of panels. I said they were very nice. I was down here superintending the Carmelite Church for Father Staples, and on one or two occasions I walked across to Father Kavanagh, who was an intimate personal friend of mine. He put his arm in mine and said, "Come over to the church and see Ryan's work." At that time as much of the structure was erected as goes to the altar table. He asked me if I thought a certain joint was not too open on the side of the altar on the Epistle side. I said, "Anything of that kind will be cured on the pointing." I did not see the altars until the archbishops consecrated them on October 11.

The Coroner : So far your evidence only goes to satisfy us that you are not responsible for the accident. Now we will come to the point about the falling of the statue, how is it likely that that statue fell ?

Witness : I examined the portion left, the base on which the pillar stood that supported the statue. There is a little pillar superimposed upon the base, that pillar becomes a pillar by having a cap upon it upon which the statue stood. From what I have observed I am of opinion that this column must have received an injury at some time or other, either when the canvas cover was being put on or being taken off, or by some inadvertence it got a little blow, and the part of the column that rested on the base became fractured—that is, the plaster-of-Paris became fractured—leaving an air space, and when the atmosphere became heavy and condensation took place rapidly, it accumulated on the hard surface, ran down, and, finding a vacancy, softened the plaster, and gave the statue a tendency to fall over.

Are you of opinion that that could have been obviated by a skilful tradesman in the erection of that statue ?—It might have been obviated by putting a longer dowel in ; but there is an objection to that, because if you perforate the column and put the dowel through it, and it got a blow, it would split it down. It is considered that to dowel the part is sufficient, as long as the equilibrium is maintained.

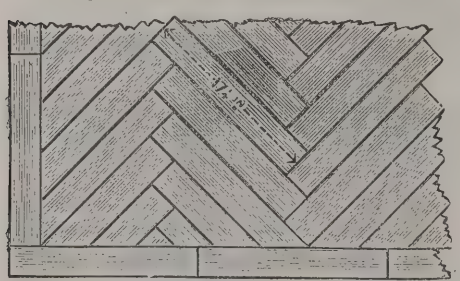
A Juror : Do you believe the dowel was too short ?—The dowel would last all time if there was not a blow.

Are the dowels in this altar the usual length ?

Witness said he thought the dowel in the statue that had fallen was long enough. He thought the dowels in some of the other statues were rather short.

To Mr. Heffernan : The dowel is 5-16th of an inch.

Mr. Heffernan : Is it usual in putting together work of that nature to dowel it with iron ?—Sometimes it is.



Is it not understood in the profession that iron should not be used with marble because rust will discolour it, and may have an injurious effect on the plaster-of-Paris ?—There is no doubt that iron oxydises, but when it is kept from the possibility of contact with exterior air, and surrounded with plaster-of-Paris, it does not.

Suppose there was evidence that the men who were carrying out that work were not a steady class of men, would you then say that it was not owing to subsequent circumstances the accident occurred ?—The probability would then be in favour of the accident having been caused by the men themselves.

The Coroner : Are you of opinion that the dowels were perfect or imperfect to discharge the functions which devolved upon them ?—Some of them, in my opinion, were shorter than they might be.

Mr. Heffernan : If you were superintending that work and saw that portion of it placed together as you have seen it

since, would you have passed it?—I would have a larger dowel put in.

Coroner: Are you of opinion that if those dowels had been longer the accident would not so easily have occured?—If my theory is correct with regard to its having sustained a blow which shook it, I don't think that the fact of the dowels being another inch longer would operate unless they were of great length.

Mr. Heffernan: Would you say this dowel is simply a piece of copper wire doubled?—It is either copper or iron wire doubled.

Have you examined other portions of the altar?—I examined portion off which I took some ornaments myself; by the express wish of some of the clergymen, I took off the finials.

Were these different portions sufficiently secured?—I think they would have stood there.

Did you find there was any deception in the work?—You will have to instance it.

Did you find that the marble was all what it was supposed to be—marble?—There was one exception.

What was that?—A small finial on the back of the top canopy, and when I took it off I noticed it was not the same colour as the rest; it was a piece of stone.

The cross that you removed from the top of the altar, had you any difficulty in taking it off?

The Coroner said that inquiry had nothing to do with the cause of Father Kavanagh's death.

Mr. Heffernan said he wished to ascertain whether the workmanship of the altar was perfect or imperfect.

The witness said that in the parts he had examined it was capital plaster-of-Paris—could not be better; but whether the accident occurred through carelessness, neglect, or design, or any other cause, the result, in his opinion, was the same. He was convinced that the pillar itself never moved until the statue fell on account of the circles of thick dust which he found undisturbed around the base. The statue, he thought, fell backward owing to the weight of the wings. It struck the inclined plane of the canopy, displacing one of the finials, and then tilted out and got a direction forward, which made it strike Dr. Kavanagh as it fell. Unless there was something to strike it, dowel or no dowel, it would have maintained its position. Taking the work as a whole thing, it was very well done.

The Coroner: Was there anything in this accident that ordinary human foresight could have guarded against?—No. I don't think there was any precaution other than an unusual device that would have prevented the possibility of the angel falling.

Mr. Heffernan said it was the desire of the jury to thank Mr. Hague for the clear, full, and satisfactory evidence he had given.

THE RECLAMATION OF THE SAND-WASTES OF GASCONY.*

If you will take the map of France and look at that portion of the coast which skirts the Bay of Biscay, you will notice that two great rivers flow into the sea along this coast. One, the most northerly, is the Gironde, a stream which has upon its banks the great commercial city of Bordeaux; the other river is the Adour, the mouth of which is 150 miles south of the mouth of the Gironde.

Between the mouths of these two rivers the shore of the Bay of Biscay is formed absolutely and entirely of sand, and for a considerable distance inland from the coast the soil of France is composed of sand. It is to this great sandy district, covering nearly two millions and a half of acres, and known in France as the Landes or Moorlands, that I wish to direct your attention.

These moorlands have been the despair of agriculturists for centuries, and have been universally regarded as among the dreariest and most unwholesome districts in Europe. Sand has not the reputation of being a very profitable soil to the agriculturist, and, in addition to the natural poverty of the soil, the farmer in this region has had to contend with the impossibility of efficient drainage. The Landes formerly produced nothing except a scant herbage sufficient to support a few miserable sheep, tended by shepherds as ill-favoured as their flocks, who generally suffered from one or other of the many diseases prevalent in the country; for disease was about the only crop which the Landes formerly brought forth abundantly.

Indeed, you will find that plains which are unproductive are generally unhealthy. The Campagna round Rome is a very hot-bed of malarious and other diseases, and the sandy plains

COLES, STEWART & CO.,
STOCK AND SHARE BROKERS.

Messrs. COLES, STEWART & CO. undertake every description of Stock Exchange business, and have special and early information on all leading Stocks; they are also continually advised by telegram from the chief Mining centres, both at home and abroad. For Investment Messrs. C., S. & Co. make only one charge of $\frac{1}{16}$ per cent. commission on all descriptions of Stocks, and open Speculative accounts with from 1 per cent. cover and upwards, without any further risk or liability to their clients whatever.

THUS, £5 commands £500 Stock; £10, £1,000 Stock; £50, £5,000 Stock;
And so on to any amount.

In the transaction of speculative business Messrs. C., S. & Co. make no charge for commission or brokerage whatever unless their client makes a profit, when they take 5 per cent. of the profit made as their remuneration.

All transactions advised by wire as soon as completed. Monthly Circulars and Mining Reports post-free on application.

COLES, STEWART & CO., St. Stephen's Chambers, LONDON, E.C.

of Holland and our own Lincolnshire enjoyed a similar evil repute before efficient drainage was brought about by skilful engineers, and the cultivation of the soil became possible. Husbandry and disease are sworn foes, and the pursuit of agriculture is generally the pursuit of health, and a healthy man is generally contented. Here is an argument for "small holdings," for "three acres and a cow," and for "allotments," which I freely give to those who find pleasure in political contention.

The drainage of the Landes presented special difficulties, and difficulties which no engineering skill and no expenditure of money in the direction of bricks, mortar, and machinery seemed likely to overcome, and for the following reasons :—

The reputation of the Bay of Biscay is familiar to every Englishman. It is there, if anywhere, that the force of wind asserts itself, and the winds are generally westerly in direction, and blow with fearful violence from the sea over the land.

The shore of that part of the bay with which I am dealing is composed, as I have said, of unmitigated sand. The effect of the wind upon sand is familiar to all of us, for the sand is borne upon the wings of the wind and travels considerable distances.

Now, in the Bay of Biscay the rise and fall of the tide is considerable, so that the sand washed up by the sea is left high and dry to the extent of many feet at low water.

Again, in the latitude of the Bay of Biscay the sun is far more powerful than here, so that in the interval between the times of high water the sand is greatly heated by the sun, and is so thoroughly dried that the particles no longer tend to stick together, glued by natural moisture, but are easily driven before the furious blast which comes roaring from the sea. When the wind is not very strong it blows the sand into heaps along the shore. These heaps or hills may reach an elevation of from 60 to 300 feet, with an inclination of about 30 degrees towards the sea. These heaps of sand are called "dunes," a word having the same origin probably as the English "down," and formerly the whole foreshore of the Bay of Biscay, between the Gironde and the Adour, presented an undulating appearance, as though a portion of the swelling, rolling sea had been turned to sand and become stationary. If these sand-hills had been really stationary they would have formed a natural rampart against wind and waves, and it might have been possible to drain and cultivate the land behind them. But this was not the case. The scanty herbage of grass and reed which grew upon the dunes was not enough to fix them. It only required a gale of moderate force to completely alter the face of the country ;—hills became flat, valleys were filled up, the lakes which formed behind the dunes became dry land, the water which the lakes contained was forced in some new direction, and what happened to the lakes also happened to the watercourses, with the result that the whole country was waterlogged, and fields and gardens which had been painfully and industriously cultivated were submerged by the drifting sand. It is even stated that villages disappeared completely in this way, and that the enterprising agriculturist in digging his estate was liable to the surprise of finding just beneath the surface the brazen weathercock on the steeple of some long-forgotten parish church. It is a great labour, even at the present day, to keep the mouths of the Gironde and the Adour free from drifting sand, and it is certain that a century or so ago the course of the Adour was completely changed, owing to the channel getting dammed by sand blown into it. If an accident such as this could happen to a mighty stream like the Adour, one may judge of the great uncertainty which attended the course of smaller streams, and the absolute impossibility of draining the land.

A few feet below the average level of the surface of the district there is an impermeable stratum, locally known as *allios*, which keeps the water from flowing away, and beneath the impermeable stratum was more sand sodden with undrinkable water.

The result of this condition of things naturally was that the district of the Landes during the wet season was a swamp, and during the dry season a pestilential morass. The district was uncultivated, and produced nothing but scanty herbage, which served as pasture for a few wretched sheep, tended by shepherds doomed to spend their lives upon stilts, for the country was such that it was impossible to walk far in any one direction without sinking to the waist or shoulders. The country produced no corn and the population was the scantiest in proportion to acreage of any district in France. The population was kept down also by disease. Fevers of all kinds—and especially those of a malarious type—were exceedingly common. And, in addition, there was a disease peculiar to this and a few other districts in Europe, known as Pellagra—a terrible disease which disfigured and slowly killed, the patient dying with the aspect of a mummy and the mind of an imbecile.

The Landes had remained for centuries as a hideous blemish on the fair face of France, and all attempts to reclaim and cultivate them had signally failed. The Emperor Charle-

IMPORTANT.—To Specialists, Manufacturers, and Others.

Effective Advertising at a Minimum Cost. Now in preparation for Publication in January. Demy 4to, Illustrated.

THE ARCHITECT AND CONTRACTOR'S COMPENDIUM

And Specialist's Directory for 1887.

EDITED BY JOHN E. SEARS, A.R.I.B.A., F.A.S.

An illustrated and priced catalogue and directory of specialities, manufactures, and requirements in every branch of the Building Trade, and in office and workshop, carefully classified and indexed, combined with Legal and General Information, Tables, and Memoranda. Illustrations may be inserted produced by the Litho- or Ink-Photo process. In addition to the usual circulation of a first-class Annual, **the Publishers guarantee to send a copy gratuitously to every Architect and Builder whose name appears in the London Directory.** Advertisements will thus for twelve months be in a convenient and attractive form before the eyes of the people Advertisers specially desire to reach, and this **at a cost less than half that of sending out one circular.**

The minimum **guaranteed circulation** of the **Compendium** is 3,000 copies, but the actual circulation will probably reach a much higher figure.

Special attention is directed to the fact that, at great expense, the Publishers have arranged to illustrate this work by the magnificent **Ink-Photo** process, specimens of which are to be seen weekly in *The Architect*. The **Compendium** will thus be far ahead as an artistic production of any class Annual published, adding greatly to its value as an advertising medium. The Ink-Photos can be produced, **without block**, from **any** drawing or photograph, and printed in any tint. The charges are very moderate, and will be quoted on application.

An exceptional opportunity is thus afforded Country and Colonial Firms to introduce their manufactures to the London market. The Compendium will be produced in first-class style, and will doubtless become a standard work of the trade.

Prospectus, with full table of contents, &c., free on application; but Advertisements and Blocks should be forwarded at once to the Advertisement Manager, 16 New Bridg Street, London, E.C.

London: JAMES SEARS & SONS, Printers and Publishers, Crane Court, Fleet Street.

magne, it is said, employed his troops in the intervals of his Spanish campaigns in an attempt to reclaim the Landes, but the forces of nature laughed at the puny opposition of the greatest magnate of the world, and at once resumed their sway as soon as the imperial soldiers had ceased to dig ditch and throw up bank.

I have no fear of being contradicted, when I say that it is of no use to attempt to fight with nature. We may oppose her for a time, but only for a time; but in the end she asserts her sway, and man sees too late how his labour has been in vain.

Dwellers in these islands do not need to be reminded of the awful and irresistible power of wind and wave, against which the mere dead weight of cyclopean breakwaters, constructed at gigantic cost and maintained by constant periodic expenditure, is at times laughably impotent. I need not say that the wind and waves of the Bay of Biscay are the roughest and rudest in the world, and that if the maintenance of dead breakwaters is an endless and almost hopeless task on our coasts, on the stretch of coast which I am considering their construction and maintenance would be alike impossible. Thus it was that until the latter end of the last century the condition of the Landes, a tract of two millions and a half of acres, seemed hopeless, and they seemed doomed to be open to the fury of sand storms for ever, and to remain a pestilential, unprofitable, undrained swamp to all eternity.

But, happily for France, and especially for the dwellers between the Gironde and the Adour, there was born in 1738 Nicolas Theodore (or Thomas?) Bremontier. It is said that the world knows nothing of its greatest men. Certain it is that Bremontier was one of the greatest benefactors to humanity that the world has ever known.

Bremontier recognised the fact that the only way to grapple with the forces of nature is not to fight blindly with them, but to try to make use of them. Nature is always working for our benefit, and although it seems as though at times in a fit of anger, as it were (the real object of which we may fail to comprehend), she destroys much of her own work, still, in the long run, those who endeavour to turn the forces of Nature to account will find the balance enormously in their favour.

It is well known, and has been long recognised, that the best protection for a bank or rampart against the fury of the elements is to plant it. A loose heap of earth is liable (no matter how huge it may be) to be washed and blown away in times of tempest. If, however, the bank be planted, the roots of the trees and plants hold the elements of the soil together, and the spreading branches and leaves form at the same time a protection from the fury of wind and water. It is true that even planted hills and banks may suffer severely in times of exceptional storm, but the storm once passed, the silent forces of nature commence at once the work of reconstruction; the damaged roots send forth fresh rootlets, the damaged branches soon push again with buds of promise, and possibly before the advent of the next exceptional gale the storm rampart is stronger than before. These silent forces of nature are truly beneficent; they merely ask for fair play, they work for us without wage, and one great principle of success in all work in this world, be it legislative, be it sanitary, or be it of any other kind, is to go with them, not to fight against them, to learn if we can what is nature's inexorable law, and lay to our hearts the fact that nature brooks neither stubbornness nor disobedience.

Bremontier recognised the fact that the only way to fix the drifting sand-dunes was to plant them: but how and with what? These were the questions he had to solve. Sand is not regarded as a promising soil by agriculturists in general, and sea-sand along the shore is the least promising of all. And yet sand must contain in its interstices a good deal of organic matter left by the seaward-tending rivers, and the fact that the sandy estuaries of rivers are very liable to breed malaria may be taken as evidence that organic matter must exist in quantity and in fine division among the minute particles of sand. This spring I was astonished at finding, close to Biarritz, and within a few yards of the sea, a very flourishing crop of peas which had been sown in the sand without, apparently, the admixture of any manurial body. They were protected from the sea winds by hurdling made of gorse, and enjoyed an ample exposure to the sun, and thus bid fair to yield a good return in due time. The pea is a plant that sends its roots very deeply, and the roots doubtless found moisture and nourishment at a great depth below the surface. For fixing dunes, however, something more permanent than peas is necessary, and Bremontier resolved to try the *Pinus maritima*, a species of pine tree which was known to flourish in sandy soils near the coast. The *Pinus maritima* is a species of Pinaster, and in habit and size it very much resembles the common Scotch fir, with which you are all familiar. Bremontier made his first sowings of the seeds of *Pinus maritima* in the year 1789, and I will state shortly his perfected manner of procedure by which he overcame the obvious difficulties of his task.

BRYANT, POWIS & BRYANT LIMITED,

"THE PEDESTAL VASE,"
JENNINGS' IMPROVED W.C. APPARATUS

(Combination Urinal and Slop Sink).

Registered No. 16,300.

A PORCELAIN VASE set on a tiled or mosaic floor, within walls or a dado of glazed tiles. The usual wood framing, forming a storehouse for the retention and accumulation of *damp*, *dirt*, and *disease germs*, with the joints, crevices, and imperfections in work which the closet enclosure so often conceals, is entirely abolished. The seat is hinged, permitting free access for use as a *slop sink* or *urinal*, and for cleansing, so that the entire apparatus and space can be freely washed down. For this latter purpose the floor should be slightly sunk, and laid to fall to a grating, with waste carried through the external wall, and terminating in a copper flap valve to prevent draught.

☞ The suggestions as regards wall linings and floor, may, of course, be modified as best adapted to the building in which the closets are used; and in the consideration of such details, alternative schemes will readily present themselves.

At the recent **HEALTH EXHIBITION** (South Kensington, 1884), amongst a series of official tests, under the supervision of Baldwin Latham, Esq., C.E., and the Jury No. 9, Class XXIII., and successfully withstood by this closet, the following may be cited in evidence of its efficient action. Being fixed in position shown in illustration, with **"JENNINGS' PATENT SINGLE FLUSH WASTE-PREVENTING SYPHON CISTERN"** 5 feet over, with 1½ inch down pipe, ten apples (averaging 1¼ inch diameter) and a flat sponge about 4½ inch diameter were thrown into the basin. The water, as well as the whole of the exposed or dry surface, was first blackened with plumber's "smudge," and the sides covered by four pieces of thin sanitary paper, which adhered closely to the soiled surface. The handle of the cistern was then pulled, and the two-gallon flush liberated. After seven seconds (the time occupied by the discharge), a receiver placed under the trap outlet was removed, containing in the blackened water **the ten apples, the sponge, and the four pieces of paper,** no traces of the soil remaining visible upon any part of the apparatus.

GOLD MEDAL AWARDED.

THESE CLOSETS are already in use in Hospitals, Banks, Hotels, Offices, Private Residences, &c., with most satisfactory results, and, fixed in the manner described, in appearance and action leave nothing to be desired. By the novel arrangement of the supply to Basin, as shown in the sectional sketch annexed, the whole surface is well flushed and cleansed, whilst the bottom of Basin and Trap are thoroughly scoured by a concentrated rush of water which insures the **instantaneous removal** of the contents, thus overcoming the inherent defects in the many imitations recently produced of **"JENNINGS' MONKEY-CLOSET"** (the **original form of wash-out watercloset**), which was invented and patented by G. J. in 1852.

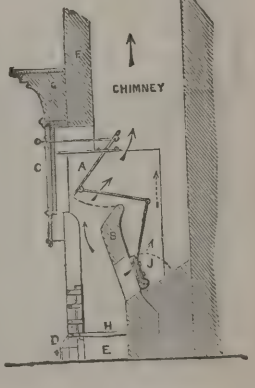
THE "ECLAT" AND THE RUMFORD-TEALE FIRE-GRATE.

"As little ironwork as possible."—Vide *"Economy of Fuel," by T. Pridgen Teale.*



These fireplaces are wholly constructed of Fire-clay and Glazed Terra-cotta or Faïence Ware on principles introduced by the celebrated Count Rumford, and recently revived by Dr. T. Pridgen Teale, with the addition, in the form of the "Eclat," of a Front and Range projecting in advance of the Chimney-Breast, as recommended by Sir Wm. Armstrong.

A Pint only of Residuum in the form of Fine Ash obtained from the combustion of 22 lbs. of Coal.

WILL BURN ANTHRACITE OR COKE.

Illustrated Circulars from the Makers, together with Catalogues descriptive of their—

Patent Chain Fan and Hopper Light Opener.
" Perfect Fanlight Regulator.
" Chain Skylight Lifters and Iron Skylights.
" Reversible Rivoted Windows for Cleaning from the inside.
" Epicycloidal Action for Opening one or a number of Lights simultaneously.

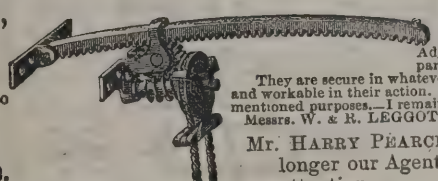
INTERNATIONAL HEALTH EXHIBITION.—MEDAL Awarded for

LEGGOTT'S PATENT ADJUSTMENT,

FOR FANLIGHTS, SKYLIGHTS, &c.,

Is admitted to be the best ever put before the Public.



From 5s. each.

Write for REDUCED PRICE LIST and Testimonials to

W. & R. LEGGOTT,

70 Park Road, Bradford, Yorkshire.

N.B.—Size and height of window no object.

TESTIMONIAL.

BANGOR, N. Wales: September 14, 1885.

Sirs,—I have pleasure in testifying that I have used Leggott's Silent Adjustments for various buildings to high skylights, fanlights, and top parts of windows, and in every case they gave satisfaction. They are secure in whatever position, whether the window is open or closed, and are quite simple and workable in their action. I prefer them to any other that I have seen or used for the above-mentioned purposes.—I remain, yours obediently, R. DAVIES, Architect.

Messrs. W. & R. LEGGOTT, Bradford.

Mr. HARRY PEARCE, 125 Great Portland Street, London, W., is no longer our Agent. All direct communications shall have our prompt attention.

TRADE NOTES.

MESSRS. MERRYWEATHER & SONS, the well-known fire-engine manufacturers, of Greenwich and Long Acre, W.C., have received the gold medal for their fire-engines at the Liverpool Exhibition.

MESSRS. JEFFREY & CO., of Essex Road, Islington, have received the gold medal of the Liverpool Exhibition for the excellence of their artistic wall papers, this, we understand, being the highest reward given for such productions in the exhibition. The same firm have received the gold medal at the Edinburgh Exhibition for "excellence of design and manufacture of paper-hangings."

THE floors of the dining-hall of the Mitcham Workhouse, just erected from the designs of Messrs. Saxon Snell & Son, have been laid with the patent wood-block flooring of Mr. Roger L. Lowe, of Farnworth, Bolton.

BUILDERS' SCREENS, unequalled for Strength, Durability, Efficiency, and Cheapness. Also Castings of all descriptions.—STEVENS & CO., Ceres Ironworks, Kingston-on-Thames.

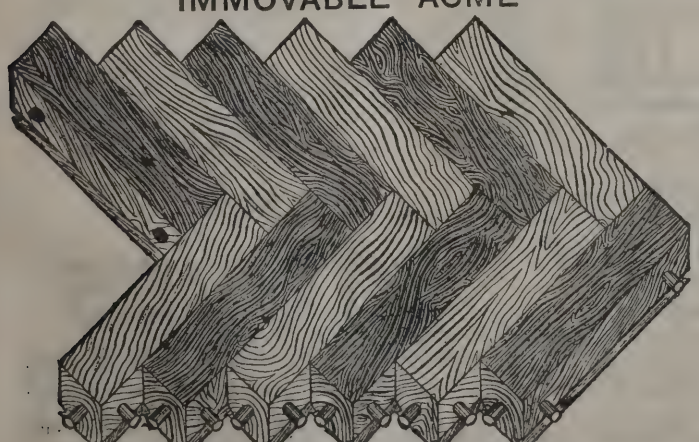
Messrs. Goodman & Co., of 72 Bishopsgate Street, E.C., the well-known firm of merchants in bricks, &c., have undertaken the agency for Titus & Henksman's patent sewer-gas trap. Under such influential auspices, and the article itself being a great improvement, success should be insured.

An interesting and important detail in connection with the Constitutional Club recently opened is the arrangement of locks for the room-doors, executed by Messrs. Hobbs, Hart & Co., under a mastership for floors, and a grand master-key controlling all locks throughout the building. All the modern hotels, including the Métropole, the Grand, the First Avenue, have adopted this system of Messrs. Hobbs, Hart & Co., and the public will be interested in knowing that this important consideration has not been overlooked in a building wherein modern appliances have been so carefully worked out and adopted by the architect.

A new style of Christmas-card is being introduced by Messrs. Billing & Co., of 144 High Holborn. They are an imitation of repoussé work, and therefore they possess more endurance than the ordinary cards. Some have been designed by architects and some by an authority on heraldry, and they have more of the antique character than is seen in the ordinary ones.

Messrs. Shand, Mason & Co., of London, have been specially awarded two gold medals for the excellence in design and workmanship of the fire-engines exhibited by them, and lent for use in case of fire, at the Edinburgh Exhibition. Two patterns of steam fire-engines are included in the first award—the celebrated "Equilibrium," as used in Glasgow, Bradford, Leeds, and the principal towns in the northern and midland counties; and the patent London Brigade Vertical, of which thirty engines are in use in the Metropolitan Fire Brigade, and which has also been supplied to Edinburgh, Dublin, Manchester, and the leading Volunteer Brigades. The second medal is for a London Brigade manual fire-engine, bearing a number of important improvements.

We have received a circular from Mr. W. S. Oxborrow, of 57 Cheapside, E.C., announcing that he has opened an auction mart in the Romford Road, Stratford, where he purposes conducting periodical sales. We understand that Mr. Oxborrow's sale last week of an engineer's plant and stock in Commercial Street, Shoreditch, was a very successful one, the prices obtained being exceptionally good. Mr. Oxborrow has for some years past been actively engaged in the building and engineering trades, and is therefore in a peculiarly advantageous position for conducting sales in this branch of his profession.



We can recommend the trade not to miss calling at Stand 154 at the Brewers' Exhibition at the Agricultural Hall, and seeing the exhibit of Mr. H. Trott, of High Street, Battersea, S.W. He shows a splendid assortment of his quick-filling bib and other valves, for high and low pressure water, and for which he has been awarded a certificate of merit by the Sanitary Institute of Great Britain. A long-felt want in this direction has been filled, and we can only say that we think these valves are simple and effective and that once used they will always be used. They are strongly made, and consist of a sliding, swinging valve in a chamber covered with a screwed cap, the unscrewing of which facilitates the removal of the inner valve, and the insertion of a new patent beaded rubber, when necessary, a work of the greatest simplicity and ease. This patent is extremely applicable for beer, wine, spirit, and other taps, and effects a great saving in the course of the year.

JOHN WARNER & SONS.

Pumping machinery forms one of the large departments of the firm of Messrs. John Warner & Sons, of Cripplegate, E.C., and Walton-on-the-Naze. Section D, Part 2 of their catalogue devotes about 130 pages illustrated throughout to this particular branch of manufacture. The pumping machinery includes every description worked by wind, water, steam, animal, or manual power. The horse-power machinery is of the most improved kind, for deep well and heavy lift purposes and for supply of asylums, prisons, workhouses, and other large institutions, breweries, schools, mansions, &c., and among others may be observed the combined horse and hand-power machinery as used on the South American railways, and other manual-power machinery, with ram pumps, as adopted by the Indian Government for prisons. Special machinery also for shallow wells, streams, pits, &c., for working with horse power, such as the colliery force pump—a small horizontal treble ram—and the same also as a portable machine, being mounted on flanged wheels and the like, and others on ordinary tire wheels. The combined horse and manual power machinery includes several varieties, according to the particular service that they are to fulfil; combined horse and steam

WOOD-BLOCK FLOORING.

INTERNATIONAL EXHIBITION, LIVERPOOL.
GOLD MEDAL,
The ONLY and HIGHEST Award for
WOOD-BLOCK FLOORING
(W. DUFFY'S PATENT),
"Immovable Acme."
M. C. DUFFY & SON,
Chief Office: 66 Storks Road, London, S.E.

machinery, and combined horse and wind-power. A large amount of space naturally is given to steam-pumping engines and boilers, all of improved kinds; vertical and horizontal combined stationary steam-engines and vertical boilers, steam-pumping machinery for waterworks, stand-pipe pumps for deep wells with varying water levels, pulley pumps for manual and steam-power. The horizontal ram and plunger pumping-engine for wire rope or leather belt, as made by this firm for the Colombo Waterworks, was awarded a silver medal at Camborne in 1882. Treble-throw ram pumps of various descriptions for wire, chain, or hemp ropes, and a variety of pulley pumps for steam-power for minor purposes, and so on. In this section of the catalogue are over 200 forms of pumping machinery, from the most powerful to the simplest; it would be impossible to deal with it in detail, but for reference it is most valuable. The same detailed attention has been given in the production of the catalogue of plumbing and ironmonger's brasswork. Section C is a descriptive catalogue of steam motors and their application; a special catalogue is devoted to windmill power, another to water wheels and water motors. A very good handbook also has been produced by Mr. S. B. Goslin, F.R.M.S., manager for Messrs. Warner & Sons, on the growth of hops, in the course of which the author also deals with those machines which are specially suitable for this field of industry—for instance, hop-washing apparatus ranging from hand-syringes up to horse-draught washing engines; hop-washing hose, &c.; jets, sprays on garden engines, &c.; portable horse-power irrigator ram pumps; circular water-carts for carting water or washing liquors, &c.; and the most suitable kind of plough, &c., is not allowed to escape attention. This firm has taken many prize medals here and abroad, and their specialities are much valued wherever employed.

THE SOUTH YORKSHIRE MECHANICAL TRADES' EXHIBITION.

THIS exhibition, of which Mr. H. Cullabine is the secretary, was, as mentioned in last week's *Architect*, opened at Sheffield on the 19th inst., amongst those present being Alderman W. H. Bullair (who presided), the Mayor of Sheffield, Alderman J. W. Pye-Smith, Alderman Brooksbank, Colonel Byam, C.B., &c. The exhibition is mainly of a local character, the object being to promote the interests of manufacturers of the town and locality. Excellent arrangements have been made for the fair representation of the leading firms, and no fault can be found with the classification. The exhibitors of special interest to our readers are Messrs. Redmayne, May & Co., of Sheffield, who have a good show of school furniture. This firm's "Hallamshire" and "Improved Hallamshire"—forming into flat table, writing slope, and backed seat—are noticeable for their secure and simple method of locking together and rigidity in any position. Furniture suitable for any class of school, or for church missions or lecture halls, is well represented. The exhibit is a very comprehensive one, including every modern improvement, and the material and workmanship is of the very best description. Messrs. W. Truswell & Son have on exhibit a heating apparatus. This firm claim to be able to undertake heating either by hot water or hot air, and with which they have been successful. They do not insist on the advantage of any system, but do the work according to requirement. Mr. H. Foss has a very tasteful selection of tiles, grates, &c. Messrs. J. Mountain & Son are prominent with sanitary ware, their patent disinfector being a great improvement, for it is easily fixed and always in working order, and is consequently meeting with the favour of the sanitary authorities. Messrs. Garlick & McGowan, patent agents, of Sheffield, exhibit, amongst other improvements, a smoke preventer in the form of a box-shaped metal receptacle inserted in the chimney, passing through which the smoke is regulated effectually. It is an article which should come into general favour. Messrs. J. C. Glossop exhibit a patent gulley-trap worthy of notice. Messrs. Wingfield, Rowbottom & Co. show some very artistic lamps, ornamented with floral bouquets, which give a charming effect. The exhibition is a very interesting one, and merits to be described in more detail.

BUILDERS AND WORKMEN IN BOSTON, U.S.

THE Master-Builders' Association of Boston, after conference with the real estate owners and architects of the city upon certain aspects of the labour question, have adopted the following code of working principles for the ensuing year, in the hope that it will be accepted by all concerned as a rational and conservative method of meeting labour agitation in its relation to the building trades:—

Art. 1. Change in method of payment for labour performed.—Beginning at a date not later than the first day of April 1887, we will pay for all work performed by journeymen or labourers in our various trades at a certain price per hour. This price

LOFTS' PATENT STOVES

Will burn any kind of Coal or Rubbish, consume their own Smoke, and require only one-fifth the Fuel of any other Stove.

After four years of tedious experiments I have been able to produce what has long been required, viz., Domestic Stoves which consume only one-fifth the quantity of Coal (*One Ton instead of Five*) required by any ordinary stove, at the same time giving as great an amount of heat and more thorough ventilation. I have great confidence in recommending these to the public. Since perfecting them I have tried them for six months in the worst of smoky chimneys, and they have not failed in any one case; have shown them at work to a large number of scientific, medical, and practical men, and they have given but one opinion, which is that, as regards heat, health, and comfort, they are perfection, and they have not seen or heard of anything to equal them. The fire-grate is perfectly open, like the register or slow-combustion stoves now in use; they are neat, strong, and easy to understand; will burn any kind of coal or rubbish; consume their own smoke; are lighted just in the same way as an ordinary stove, and draw up as quickly and as easily.

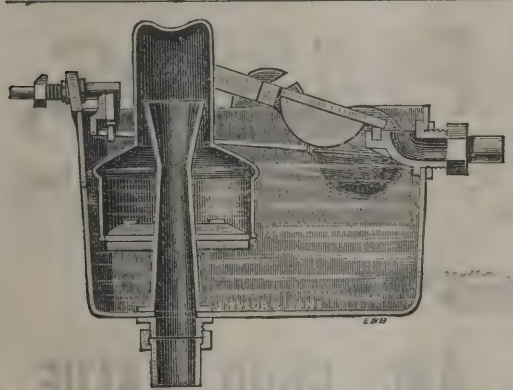
Full particulars on application.

To be seen in action at London Show-rooms, 165 Queen Victoria St., E.C., or at Cambridge

per hour shall be a matter of agreement between the individual workman and the individual employer. This change is not intended to apply to work known as "piece-work" or work "by the year."

Art. 2. Hours of labour.—In order to rationally test the question of whether ten hours per day is too long for men to labour, and whether a less number of hours can be accepted as the measure of a day's labour without seriously retarding business enterprises, we will begin on the first day of April 1887 to work nine hours in each working day, beginning at 7 o'clock, A.M., and ending at 5 o'clock P.M., with the usual hour at noon for dinner, under payment by the hour as set forth in Article No. 1. All work done before 7 o'clock A.M., and after 5 o'clock P.M., to be paid for as overtime at such price as may be agreed upon between the workmen and employers. We will continue on this plan during the year 1887. If it is demonstrated that this change can be made without detriment to the interests of the workmen, or the owners, then the contractors will be satisfied, and if further reductions seem desirable they can be considered at the close of the year when this experiment shall have had a fair trial. If, however, there should be displayed a desire to disturb this trial by bringing on any general strike during the year 1887, then we shall feel at liberty to return at once to the old standard of ten hours.

Art. 3. Protecting clause in contracts, &c.—For the greater security of the contractors, we will demand the insertion of a clause in every building contract relieving the contractor from any forfeiture or demurrage on account of delays caused by strikes. This demand, we are assured by real-estate owners and architects, will be cheerfully granted. In case of a general strike, those men who wish to work, and will work, will be kept employed as long as there is anything to be done, and will be protected in their employment, provided they do not aid and assist the strikers by contributing to their funds; but men who engage in the said strike will not be re-employed until the said strike is completely over, or until they, as individuals, are willing to go to work on the same terms as above stated. In event of a strike of any one special branch throughout the city, the men who will continue at work in that special branch will be kept employed the same as in a general strike, and all other branches of building will be continued with such men as will not contribute to support the strike. When a point shall be reached upon any building or buildings where further progress is blocked because of the said strike in a special branch, then the contractors in that special branch shall not be pushed or forced by their co-contractors to complete their work, but the said buildings shall be allowed to remain incomplete till a reasonable and satisfactory settlement be reached.



Art. 4. Improper interference with business.—Certain workmen have of late very improperly interfered with the carrying on of work by striking or threatening to strike for the most trivial causes, as follows:—Because certain other workmen were employed. Because certain workmen were not employed. Because certain workmen were discharged. Because certain stock was used or was not used. Because more than a certain number of apprentices were taken on, and for other equally untenable reasons. They have also intimidated certain fellow-workmen by threatening that they would prevent their getting employment by refusing to work with them unless they joined certain societies. Such practices we condemn as most unfair and intolerable, and we agree that in case any workmen interrupt and embarrass our operations by such procedure we will promptly discharge them and notify our fellow-members of the discharge. We also agree that all conspirators shall be prose cuted to the extent of the law.

Art. 5. Arbitration.—It shall be, as it always has been, the recognised right of the group of workmen in the employment of any individual contractor in the building trades to demand and receive from their employer a hearing upon any grievances that may arise, or any changes that may be desired; and at this hearing they can elect to be heard through a spokesman chosen from their number, or by their individual voices; but no person outside of the employment of the said contractor will be allowed to represent them. If amicable ground of settlement is not reached through such hearing, then the grievances shall be left to arbitration—should the terms of such arbitration be mutually agreed upon by the employer and his workmen—in the same manner that other business disputes and complications may be settled.

The following agreement is to be signed by the master-builders:—

We, the undersigned, in our individual capacities as contractors in the various branches of constructive work used in the erection of buildings, and as members of the Master-Builders' Association of Boston, hereby mutually agree that we will aid, support, and assist each other in maintaining the same stand against improper dictation as that taken and successfully held by us during the strike of May and June 1886.

We pledge, in addition, that we will aid, support, and assist each other in carrying out the letter and spirit of the proposi-

BEAN'S PATENT DIRECT-ACTING VALVELESS WASTE-PREVENTING CISTERNS.

These Waste-Preventers are simple in construction and rapid and powerful in action. The working parts have been improved and are well balanced. The arrangements for charging the siphon are such that a slight pull by hand is all that is necessary to cause the immediate and automatic discharge of the contents of the Cistern.

THE CHIEF ADVANTAGES are—(1) the direct-acting method of charging the siphon, by which the full flush is obtained at once; (2) simplicity of construction; (3) no valve in the bottom of the cistern to cause leakage; (4) no tight-fitting parts to corrode or get out of order; (5) no waste incurred by fastening the "pull"; (6) insures a rapid and regulated flush without holding down the pull.

N.B.—Judges have conferred Greatest Honours, Highest Awards, Gold and Silver Medals at all Competitive Exhibitions. ESTABLISHED A QUARTER OF A CENTURY.

tions above described as our code of working principles for the year 1887.

We further agree that, should we differ from the opinion of the majority of our fellow-members, we will not in any way embarrass their purpose; but, recognising the fact that uniformity of action is necessary for the proper trial of a scheme like this now proposed, we will faithfully carry out and support the plan agreed upon by the majority during the year 1887, and agree that any member deviating from the action decided upon by the majority will be considered amenable under Section 3 of Article 8 of our by-laws.

In testimony of our assent to the agreement and propositions before mentioned, we hereunto affix our signatures, and agree to faithfully adhere to the principles set forth.

We invite all contractors in the building trades, whether located in this city or in any of the cities of New England, to join with us in this attempt to make fair trial of a scheme calculated, we trust, to set at rest labour agitation in our trades, and maintain unimpaired that necessary control and authority without which no enterprise can succeed. We invite all such contractors to call at our rooms and append their signatures to this code of working principles.

*RECLAMATION OF THE SAND-WASTES OF GASCONY.**

(*Concluded from last week.*)

I WONDER what the dull-minded and prejudiced peasant thought of this enthusiast who went forth to do battle with the mighty ocean and still mightier wind, armed only with a few handfuls of pine seeds such as might be driven far away by the first strong gust that blew. I wonder also if only the ignorant laughed at him, and if he escaped the jeers and sneers of those who had enjoyed the advantages of a better education. Probably not, and equally probably he cared little for the opinions of the prejudiced. The pine seeds were sown mixed with seeds of the common broom, and the sowings were made in a direction at right angles to the prevailing wind. A screen of hurdles made of gorse or of planks deeply driven into the sand was placed on the windward side of the seed-ground, and the seed-ground itself was thatched with pine branches and other suitable material. At the end of the first year the broom would be nine or ten inches high and the pine saplings only two or three inches, and thus the tender little saplings were nursed and protected by the plants of broom. In half a dozen years or so the brooms had reached their full growth, but the pines continued to grow, and, in course of time, overtopping the brooms smothered their nurses, and being themselves judiciously thinned and pruned by the foresters, grew into fine trees able to resist the fury of the elements, sending their long tap-roots and laterals in all directions through the dunes, and causing them to become year by year a stronger and stronger protection to the inland wastes instead of a dangerous menace. Before the dawn of the present century Bremontier had proved the success of his practice, and in the year 1801 the matter was taken in hand by the French Government, and in 1810 it was ordained that so much of the sand-dunes as belonged to the State should be planted after the manner of Bremontier, while the private property of those who were unwilling or unable to plant should be taken in hand by the State, all revenue arising from such land being confiscated until the cost entailed by the work had been recouped.

In 1817, a yearly sum of less than 4,000*l.* was voted for the reclamation of the dunes and wastes of Gascony. The result of this has been that in the department of Landes, 98,000 acres of forest have been planted, and that whereas in 1834 there were about 900,000 acres of uncultivable land in the department of Landes alone, there are now only 340,000 acres, showing that in the past half century reclamation has proceeded at the rate of 12,000 acres a year. These figures apply only to the department of the Landes, and leave out of consideration the department of Gironde, in which, however, nearly half these waste moorlands are situated. This reclamation has been made possible by the fixation of the dunes, which has rendered systematic drainage operations practicable; canals and drains have been cut in every direction, and, thanks to the pine forests, there is now no longer any risk of their being choked up with sand.

The *Pinus maritima* has proved a very profitable tree, and within twenty or twenty-five years of sowing, it began to yield a return. The timber is of very moderate quality, but is largely used for packing cases, as shores in the dockyards of Bordeaux, for railway sleepers, and for fire-wood. I may remark in passing, that the great scarcity of coal in France compels the French to look to their forests for fuel, and there is probably no nation more clever and more thrifty in the management of trees.

* An address by Dr. G. V. Poore, delivered at the meeting of the Sanitary Institute.

ASCHERBERG PIANOS,

Acknowledged by all MUSICAL AUTHORITIES and by all those who have had them in use for years to be

THE BEST

FOR TONE, TOUCH, GENERAL FINISH, AND GOOD VALUE.

Wholesale and Retail Depot :—London, 211 Regent Street, W.

The Celebrated "DUBOIS" Hydraulic Drawn Lead TRAPS and BENDS.

The above Shapes and Sizes always in Stock, and we are prepared to furnish SPECIAL SHAPES to order at short notice. These justly celebrated TRAPS are made from Pure Pig Lead by Hydraulic Machinery after the manner of Lead Pipe, and have peculiar advantages appreciated by every Plumber. They are greatly superior to either Cast or Hand-made Traps, as they have no SEAM, are of UNIFORM THICKNESS, PERFECTLY SMOOTH INSIDE AND OUTSIDE, and can be FLANGED, PLUGGED, and STRETCHED, without fear of SPLITTING. No possibility of Sandholes.

FOR PERFECTION OF MANUFACTURE THESE GOODS ARE PRE-EMINENT.

For Sale generally by the principal Lead Merchants and Wholesale Dealers in Plumbing and Sanitary Appliances throughout Great Britain and Ireland.

DUBOIS MANUFACTURING CO., LONDON AND NEW YORK.

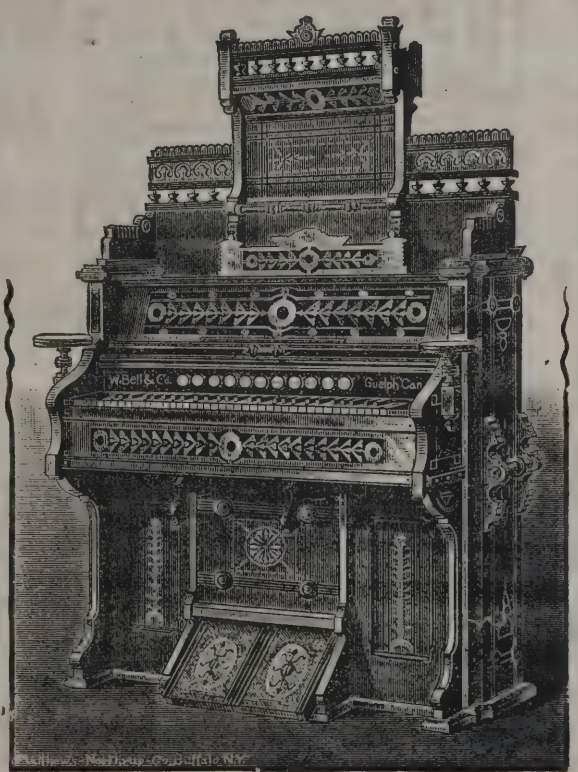
London Office and Works :—15 BRITANNIA STREET KING'S CROSS, W.C.

The pine trees are chiefly valuable for their yield of turpentine and resin, which in that comparatively warm climate is very abundant. The resin is obtained by removing a strip of bark from the tree and allowing the exuding sap to trickle into a small earthen vessel shaped like a flower-pot. The trees begin to yield resin when they are about twenty years old, and the resin is worth about 5*l.* a hogshead in its raw, crude condition. As far as I am able to judge, it requires about 250 trees on an acre of ground to give a hogshead of resin. It requires comparatively little labour to collect the resin, so that the profit per acre from the resin harvest is considerable. It is said that the draining away of the resin does not seriously affect the value of the timber. Besides resin and timber, the manufacture of charcoal is largely carried on, charcoal, as you are aware, being in great demand in France for a variety of purposes.

Thus it appears that the waste moorlands on the shores of the Bay of Biscay have become of great commercial value. Journeying from Bordeaux to Bayonne the railway passes through one long monotonous pine forest. When I state that the journey takes between four and five hours you will be able to judge of the vast tract of country which, once the abomination of desolations, is now covered with millions of the resin-yielding *Pinus maritima*. The cultivation of the pine improves the soil, which is gradually enriched and altered in quality by the dead leaves and other vegetable *débris* which fall upon it. In some places clearings have been made in the forest and vineyards planted, and I need not remind you that the most valuable vineyards in the world are on the southern bank of the Gironde, on the very fringe of the pine woods which I have been describing.

The rise in agricultural value of this tract of country, great as it is, is a small matter. The great gain, after all, has been the rendering wholesome of a pestilential swamp and the removal of a plague-spot from the face of nature. The shepherds of the Landes, except in very few places, have now no longer any need to walk about on stilts, and malaria and pellagra, from being common, have become rarities, and will soon become extinct. Life in this district no longer languishes and ends prematurely, but the dwellers of this vast district enjoy a vigorous health, and that happiness and contentment which vigorous health alone can give.

Population has increased very rapidly since the beginning of the century, and industries of various kinds are able to be carried on. Round the basin of Arcachon is a very large population supported mainly by the oyster fisheries, and the town of Arcachon, which has grown up in the pine forest, is one of the best known health resorts in Europe, where land in the best situations is worth about 1,000*l.* an acre. Well may the dwellers in Arcachon raise a statue to Bremontier, whose far-seeing and thrifty policy has brought them health, happiness, and riches, in place of disease, misery, and poverty.



I have now given you the simple details of the manner in which Bremontier's small beginning has made great end; how his pine plantation, made at first with no little labour and sorrow, began along the coast, and with the lapse of a century has reclaimed a province.

TUBE WELLS.

A Brewers' Exhibition has been held during the week in the Agricultural Hall, Islington, with conferences in the lecture theatre. On Tuesday a paper was read by Mr. R. Sutcliffe on the subject of independent water-supply. The meeting was presided over by Mr. J. W. Lees. The lecturer said that his subject was one of universal interest, but of special importance to brewers and mineral-water manufacturers. The essentials of an independent water-supply, which should obviate the heavy cost of obtaining a supply from water companies, were constancy, purity, and economy. A public water-supply sometimes failed in all these three essentials. The preliminary step to be taken with a view to obtaining a permanent and satisfactory water-supply was to ascertain the prospect of success before incurring any great expenditure, and this would be best done by obtaining the services of a skilled hydro-geologist, who would give his opinion as to the depth necessary to go, the strata or rocks which would have to be pierced to reach that depth, and the nature of the water to be found. He stated, as an interesting fact, that at the Burton breweries some forty or fifty 3-inch tube wells yielded 2,000,000 gallons daily, and the area from which they drew water was so extended that at no one point was the water level materially depressed. In concluding his paper, the lecturer remarked that a manufacturer had not always the same facilities as a town or corporation for selecting a site for waterworks, but when a new brewery was about to be built, an inquiry should be made as to the most advantageous site for obtaining the water-supply before the land was purchased. The discussion which followed was of a lengthened and technical character.

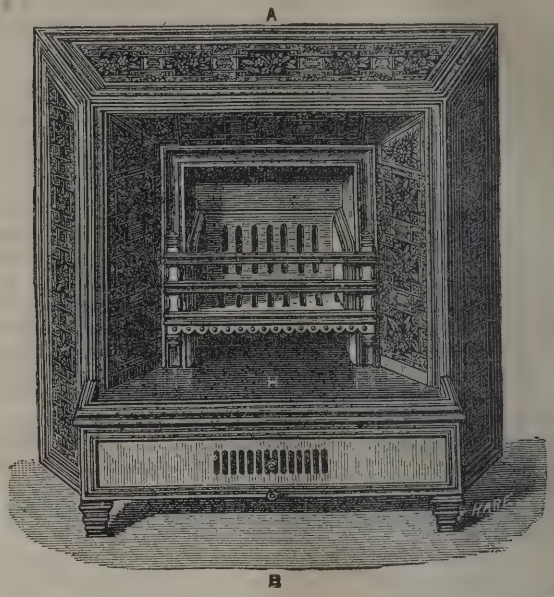
OVENS.



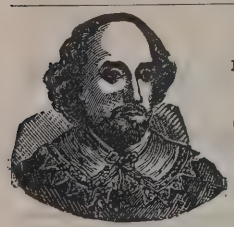
THE patent Jack oven—a new departure in ovens—which we have inspected, commends itself generally on account of its simplicity and utility. Fitted in a compartment below the oven bottom is a train of cogged wheels, acted upon by a coiled spring or its equivalent, thus imparting a rotatory motion to a vertical spindle passing through a hole drilled for the purpose in the oven below. The bottom shelf has a socket which fits on to the spindle, and also supports two standards (to carry the centre shelf or shelves) connected at the top by a cross-bar, with central pivot working in central socket in the oven top. From this it will be understood that the framework and shelves revolve, thus preventing the chance of burning in the course of baking; and for roasting purposes all that is necessary is to remove the centre shelf and hang the poultry, joints, &c., on to the hook arranged for that purpose on the under side of the before-mentioned cross-bar, thus insuring cooking in every way equal to roasting in front of the fire.

Cooks will appreciate this invention as effecting a valuable saving in their time. All interested in well-cooked food will say, "Welcome the Jack oven."

NOTES ON NOVELTIES.

Patent Improved Check Tills.—Lofts's Patent Check Till is one of the best devices yet invented for guaranteeing proprietors from peculation by dishonest assistants. In use it is manipulated as expeditiously as any ordinary till. The amount paid by a customer is entered on a slip of paper ruled for the purpose and running on a reel; the till draw is opened, change given if required, shut again, and the operation is complete. The till draw cannot be opened without ringing a bell, and, in default of the bell ringing, it is at once known that the assistant has not put the money in. If the bell rings it is because the till draw has been opened, which movement carries the entry of the amount away out of the power of its being altered or defaced. If the entry has not been made a blank space will record that trick, showing that a sum has been received and not entered. At the end of the day, or at any hour of the day, the cash in the till may be compared with the amount entered.

Open Register Stoves.—Mr. E. Lofts, of Cambridge and 165 Queen Victoria Street, London, E.C., is the patentee and manufacturer of the Open Register Stove. The results gained by this patent are an increased amount of heat over that of ordinary register stoves, with greater economy of fuel, and the consumption of its own smoke. The same principle is applied with equal success to ranges. The illustration shows that the



patent is well suited for all rooms in the house. As a hall stove it can also be utilised for schools, chapels, churches, and the like. The consumption of fuel is estimated to be one-fifth of the consumption of ordinary stoves.

Patent "Trentham" Rivetted Cornish Boilers.—Messrs. F. Silvester & Co., of the Castle Hill Foundry, Newcastle, Staffs., have brought out a patent steel "Trentham" boiler, of increased power and efficiency, to supersede the old "Trentham" boiler, of which they were the original makers. This new boiler consists of two steel cylinders rivetted together in a very substantial manner, the space between being the water

space, varying in size according to the capacity of the boiler. It is constructed on the most modern and scientific principles, and possesses a combination of advantages which make it the most perfect boiler before the public. A new patent circulating bridge made of a special homogeneous metal capable of withstanding the greatest strains is fixed inside the fire-box, and connected to the boiler. It has a series of tubes worked in through which the products of combustion pass, and besides giving a very large area of additional heating surface to the boiler, it forms a most rigid stay against collapse of the inner shell. A deflector lined with fire-resisting material shown at the back of the bridge may also be added—this assists the combustion, and makes an efficient smoke consumer. In connection with the waterway bridge are fitted extra strong wrought-iron tubular furnace-bars with suitable ends, the arrangement being carefully designed in accordance with the principles which govern the circulation of hot water. It is evident that the saving of fuel is considerable, as the largest possible area is exposed to the direct action of the fire, while every particle of fuel is utilised, and undergoes a thorough combustion before passing out of the fire-box. A fatal objection to the old "Trentham" boiler was the want of a substantial provision for cleaning out. This has been entirely obviated in the new patent boiler by the introduction of a sediment-collecting trough and handhole worked in the bottom part of the boiler, and is easily cleaned out. A brass draw-off tap for the supply of hot water or for flushing out the boiler may be fixed in handhole. The boiler is complete with furnace front, cast fire bars, doors and frame, fitted with draught regulator and perforated back plate, top flue door and frame, one flow and one return branch, the whole being supported on two cast-iron chairs, the front forming the frame for the lower flue door. There are special arrangements

IMPORTANT.—To Specialists, Manufacturers, and Others.

Effective Advertising at a Minimum Cost. Now in preparation for Publication in January. Demy 4to, Illustrated.

THE ARCHITECT AND CONTRACTOR'S COMPENDIUM

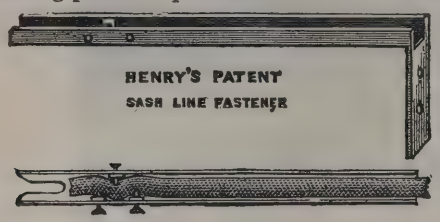
And Specialist's Directory for 1887.

EDITED BY JOHN E. SEARS, A.R.I.B.A., F.A.S.

An illustrated and priced catalogue and directory of specialities, manufactures, and requirements in every branch of the Building Trade, and in office and workshop, carefully classified and indexed, combined with an Office Diary, Legal and General Information, Copies of Building Acts and By-Laws, Tables, and Memoranda. Illustrations may be inserted produced by the Litho- or Ink-Photo process. In addition to the usual circulation of a first-class Annual, the Publishers guarantee to send a copy gratuitously to every Architect and Builder whose name appears in the London Directory. Advertisements will thus for twelve months be in a convenient and attractive form before the eyes of the people Advertisers specially desire to reach, and this at a cost less than half that of sending out one circular.

The minimum guaranteed circulation of the Compendium is 3,000 copies, but the actual circulation will probably reach a much higher figure.

Special attention is directed to the fact that, at great expense, the Publishers have arranged to illustrate this work by the magnificent Ink-Photo process, specimens of which are to be seen weekly in *The Architect*. The Compendium will thus be far ahead as an artistic production of any class Annual published, adding greatly to its value as an advertising medium. The Ink-Photos can be produced, without block, from any drawing or photograph, and printed in any tint. The charges are very moderate, and will be quoted on application.



An exceptional opportunity is thus afforded Country and Colonial Firms to introduce their manufactures to the London market. The Compendium will be produced in first-class style, and will doubtless become a standard work of the trade.

Prospectus, with full table of contents, &c., free on application; but Advertisements and Blocks should be forwarded at once to the Advertisement Manager, 16 New Bridge Street, London, E.C.

London: JAMES SEARS & SONS, Printers and Publishers, Crane Court, Fleet Street.

for seating these boilers in brickwork, and great care has been bestowed in this matter; special fire-bricks and slabs for lining and setting in stock, and experienced men are kept for this department. The patent bridge, tubular bars, &c., can be applied to old or existing boilers to increase their power, so that in cases where a boiler is too small for its work, by the addition of this arrangement the boiler is increased in power to a great extent. These boilers are made all sizes, to heat from 500 to 10,000 feet of 4-inch piping, and a number are kept in stock.

Henry's Patent Sash Line Fastener.—Messrs. Henry & Morant, of 104 Walbrook House, E.C., have introduced a patent arrangement of a simple and exceedingly useful character, by adopting which the inconvenience and vexation caused by breakage of sash lines is done away with entirely. Its utility is greatly enhanced because it can be readily fitted to existing windows. There is no particular difficulty as regards the operation of fitting it to windows already in use, as will be seen by the following plan of operations. Take sash frames out in

the usual way by removing beading; rip old sash line off, taking out all nails. Fit the patent fastener to the existing slot in frame; the fastener must fit the groove or slot easily, care being taken to keep the fastener in centre of sash bar. Countersink top of sash bar to allow flat top of fastener to go in flush. When accurately fitted put a screw into the slot of frame through the fork of fastener, about midway, and turn the screw down until the head nearly touches the fork. Position of screw is shown in figure. Now take the fastener out and place one end of the new sash line in lower end of fastener, as shown in figure. A few turns of the three screws will now hold the rope or line quite firmly, and the patent fastener can now be screwed down to top of frame, taking care before screwing down to see the prongs of the fork slip easily under the head of the screw. The screw holes should be made a tight fit for the screws, which should on no account be hammered but carefully screwed down; a little tallow on the screws will greatly facilitate their being taken out when necessary. The object of the single screw passing through forked end of fastener is to counteract the strain on lower end of fastener and keep it firmly in position. The sash frame should now be put back in its proper position, the other end of the rope passed over the pulley and fastened to weight in the usual way. Before replacing the beading take with chisel or plane as much off one side of the pocket piece as is overlapped by the beading; this done, the pocket piece can be taken out as often as required without disturbing the beading, which can now be permanently fixed in its place. Should the pocket piece be a loose fit, one small screw at top will hold it firmly. When a rope or sash line breaks where these fasteners are used it is only necessary to unscrew the top screws, take out fastener, put in a new rope, slip the fastener down the slot again, and screw down to sash bar. Neither sash nor beading need ever be moved again. Most persons will now be able to put in new sash lines themselves, without skilled aid, at a very trifling cost; and the renewal by this method involves no damage to paint or woodwork. The fastener is made of best malleable iron, of any size and strength required, to fit any window sashes, straight or curved, plain or ornamental, and is tested up to 200 lbs. weight.

Small-bore Heating Pipes.—The improved small-bore pipe hot-water apparatus of Mr. John Jackson, of Newcastle, Staffs., has proved so efficient that its use has become general for heating and ventilating buildings of every description. The circulating system of course is the principle adopted, the waste of steam avoided, the condensed water being returned to the boiler. Economy of fuel is also a prominent feature. In this system lengths of the best wrought iron are employed—$1\frac{5}{16}$-inch external diameter, $\frac{7}{8}$-inch bore. These are connected by means of sockets having right and left-hand threads. The sharp conical end of one pipe is brought in contact with the flattened end of another by simply turning the socket, which, running on both threads at the same time, forces the one into the other, thus making a perfectly solid metallic joint, stronger even than the pipe itself. A certain proportion, varying according to the temperature required, of the total quantity of piping used is arranged in the form of a coil, and placed in an iron or brick furnace constructed for the purpose. This circle of piping varies in size according to the work to be done, from the small coil which may be placed in an ordinary office grate, for the purpose of heating workshops or other offices adjoining or overhead, to the large apparatus, 5 feet long or more, which may be

All transactions advised by wire as soon as completed. Monthly Circulars and Mining Reports post-free on application.

COLES, STEWART & CO., St. Stephen's Chambers LONDON, E.C.

necessary to heat the various floors in a large mansion or extensive warehouse. The coil having been placed in the furnace and connected with the pipes in the building, the endless circuit of pipes now formed is filled with water, and tested with a hydraulic pump. Upon the application of heat, the process speedily comes into operation. The water at the bottom catching the heat, ascends by virtue of a well-known law to the top of the circulation, cold particles at the same time come down to supply the place of what has ascended. In time the whole of the water, from the top down to the bottom is heated, and the process is then in full operation; after which it is only necessary to keep up a fire sufficient to maintain the heat required. As the expansion of the water increases with the increased temperature, special provision is made for it by fixing at the highest part of the apparatus, and near to the fill pipe, an expansion tube about 3 inches in diameter, which is hermetic-

FULL SIZE OF PIPE USED

ally sealed. With the exception of the necessary supply of fuel to the furnace, the only other attention required is to see that the apparatus is periodically supplied with about a pint of water. Any kind of fuel can be burned, but coke or non-bituminous coal is used in preference; and by means of control in connection with the furnace door and damper in the flue, the heat can be regulated with great nicety. Ventilation may be accomplished by means of a ventilator fixed near the ceiling, and connected with channels which lead to a foul air chamber near the roof, fitted with a coil of piping. The heat from this coil draws the vitiated air towards it, and thus becoming further rarefied, it rises to the roof and is passed off into the open air. A careful examination of the system will show how suitable it is for all purposes, whether of private dwellings, churches, chapels, schools, shops, offices, banks, warehouses, &c. It is also used in laundries, wash-houses, drying closets, and for japanners' stoves; secures cleanliness, freedom from dirt and sulphur. Ventilation and supply of warm air can be accomplished in a variety of ways as circumstances may dictate. For large buildings a special boiler has been invented of wrought-iron tube, combining great power and economy. Among many testimonials from architects and other practical men we observe that Mr. Jethro A. Cossins, of Birmingham, has expressed his entire satisfaction with this system, which was introduced under his direction at the Liberal Club House, Birmingham, and the Old Meeting Trust Church, Bristol Road, Birmingham.

Roofing Felt.—The patent non-porous "Thistle" roofing felt of Messrs. G. Davidson & Co., of 119 Queen Victoria Street, E.C., is a valuable preparation for all purposes for which such materials are now applied. The manufacturers, in producing a light and durable article, are able to put it in the market at exceedingly reasonable prices. The material is so treated in its manufacture as to preserve its flexibility in cold as well as hot weather, and it can be fixed without complicated process by any ordinary person. It can be used with much advantage as a damp-proof course. There would be no fear of defects occurring by cracking, as may happen to slate, asphalte, &c., and it is a quick and simple way of forming a damp course. The felt is made in three degrees of thickness. This enables it to be used for many different purposes, which it would not be easy to catalogue, though everyone could bring forward some use or another to which he has applied it.

New Saw. — The Britannia Company, of Colchester, patented last year a new saw, which we have seen in working order at their London show-room, 99 Fenchurch Street, E.C. It is especially adapted for pattern makers, joiners, cabinet makers, and for circular, groove-cutting, dowelling, and drilling, and will cut up to 4 inches square. They purpose adding a moulding appliance, to enable one to cut up to $\frac{7}{8}$ths. The cutter will be driven at about 4,000 revolutions a minute. Turning even such as table tops can be done on this machine, and, if required, a handle, to enable two men (one at the treadle) to work for ripping long lengths quickly can be fixed. This patent is really one of the most useful and handy tools ever introduced in a workshop, and one that will no doubt save more than its cost every year it is used. Some accurate idea of the power of this saw can be formed from the fact that, when worked by foot, 3 feet 8 inches of 1-inch pine can be cut after the foot is taken off the treadle.

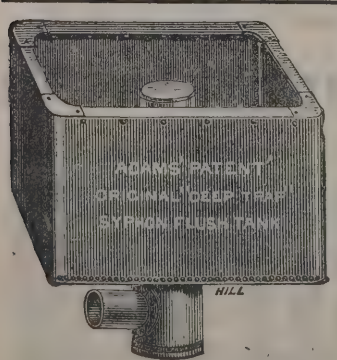
ESTABLISHED 1844.



BRADSHAW'S LIMMER ASPHALTE

Messrs. BRADSHAW & CO., being Sole Agents in the United Kingdom for, and possessing proprietary rights in, the Freehold Mines of the German Asphalte Company (of which Mr. C. W. Bradshaw is also a Director), situated at Limmer, near Hanover, and Vorwohle, Brunswick, possess special facilities for reliable and prompt delivery of their celebrated "LIMMER ASPHALTE" at low rates, either for sale in its natural state or ready for laying by their own workmen in any part of the United Kingdom. EACH BLOCK supplied from these Mines, besides bearing the impress of the Company, is stamped with the words "BRADSHAW & CO." The attention of Architects, Engineers, &c., is particularly called to the fact that the "LIMMER ASPHALTE" is especially suitable for use in the construction of Reservoirs, Roofs, &c., where water-tightness is extremely essential. For such purposes **Over 2,000,000 (Two Millions) of Square Feet of "Limmer Asphalte"** have been executed by Messrs. BRADSHAW & CO.; while for Paving purposes **Over 50 Miles of "Limmer Asphalte" Footways** have been laid by them in the LONDON DISTRICT ALONE. Messrs. BRADSHAW & CO. will be happy to forward Prices, Samples, and Testimonials, and give all information on application to :—

A Business Supplement

The Contract Reporter.

to The Architect.

LONDON, NOVEMBER 5, 1886.

TENDERS, ETC.

*** *As great disappointment is frequently expressed at the non-appearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the office, 175 Strand, London, W.C., not later than 5 p.m. on Thursdays.*

Correspondents, when writing to notify an extension of time, or an alteration of the date of sending in Competitions or Contracts, are requested in their letter of advice to write at the head of the required change—"Contract Reporter to THE ARCHITECT."

NOTICE TO THE PUBLIC.

By the Post Office arrangements THE ARCHITECT *can now be sent to any part of the United Kingdom by an affixed Halfpenny stamp; hitherto the postage has very frequently been twopence per copy. The Publishers will be happy to forward, for 19s. 6d. per annum, post paid,* THE ARCHITECT, *to residents in towns and neighbourhoods to which there is no easy access by railway. Terms for the half-year, 10s.*

Our readers are invited to address us on subjects of interest to themselves or the public. We shall be always ready to insert letters asking for a solution of any suitable questions of a professional or practical nature, and to receive replies to such inquiries.

17 BLACKMAN STREET & 7 GREAT DOVER STREET, LONDON, S.E.,

INVENTOR and PATENTEE of the

SAFETY WINDOW WITH REVERSIBLE SASHES

FOR INEXPENSIVE AND PERPETUAL CLEANLINESS,

Which has gained at the INTERNATIONAL HEALTH and SANITARY EXHIBITIONS

Two Gold, Four Silver, and Four Bronze Medals, and Sixteen Diplomas of Merit.

IMPORTANT NOTICE.

The Patentee has been advised by several of his friends to form a Company for the Manufacture of the above-mentioned Sashes in larger numbers, for the supply of the Trade and for the Home, Colonial, and Foreign Markets. Hitherto he has only supplied the Fittings, except under very special circumstances. He now proposes to manufacture the Sashes complete with Fittings.

Provisional Protection has just been granted for another Patent, whereby the Sashes will be greatly reduced in price, and, consequently, brought within the requirements of every Architect and Builder.

If any of the readers of this journal wish to receive further particulars or to take Shares in the proposed Company, they are requested to make early application to the Patentee, as it is expected that the larger number of the Shares will be privately subscribed.

Applications for Shares will be taken in the order in which they are received.

FLAT BRICK FIRE-PROOF FLOORS.

LONDON, 1874.

LONGITUDINAL SECTION.

BRUSSELS, 1876.

THE BEST as well as the CHEAPEST Fire-proof Floors yet introduced. Their small cost makes them specially suitable for artisans dwellings, residential flats, offices, chambers, and private houses.

They are constructed with hard-burnt bricks, laid flat, and bonded on the upper face with tough concrete 3 inches thick; and by the method of laying all iron is protected from the action of fire.

Experiments show a resistance to load and impact greater than furnished by the ordinary concrete floors. No thrust is transmitted to the walls, as in all arched construction, the walls being tied in and strengthened.

The floors are practically noiseless, the different densities of the concrete, brick and plaster, with the air space above, intercepting the sound vibrations.

The brick soffit forms a capital key for the plaster, and no laths or counterceiling are necessary, but for high-class work wood blocks are introduced in the soffit, to which the ordinary lath and plastering or fibrous plaster is fixed. This also provides a second air space, and furnishes the most perfect sound-resisting floors known.

They are not affected by water, acids, or alkalies, and they may be fixed during the progress of the building, thus dispensing with the use of internal scaffolding.

The concrete being tough instead of friable, the boarded finish may be nailed down without the use of sleeper joists. It is recommended to use an inch strip as a sleeper fillet. This will provide ventilation, and space for gas and water-pipes.

The depth of the finished floor is 6 to 9 inches only, and when the saving on this head is taken into account, the cost does not exceed that of the ordinary combustible timber floor of corresponding strength.

Samples of either Stone and full particulars on application.

THOMAS FREE & SONS,

Naphill, High Wycombe.

BUILDERS' SCREENS, unequalled for Strength, Durability, Efficiency, and Cheapness. Also Castings of all descriptions. — STEVENS & CO., Ceres Ironworks, Kingston-on-Thames.

VOLUME XXXV. OF THE ARCHITECT. Handsomely bound in Cloth, Gilt Lettered. Price 12s. 6d. Office: 175 Strand, London, W.C.

GRUNDY'S PATENT WARM-AIR VENTILATING FIRE GRATE.

The novelty, superiority, and advantage of this patent consist in the heating surface being greater than any other Fire-grate introduced to the public. It is very simple in construction, and is made in the form of a Stove, the back of which is semicircular in shape, with gills behind and smoke-nozzle on top, all cast in one piece. The same can be attached to any design of a Register or Stove front. It is very suitable for schools, class-rooms, waiting-rooms, hospitals, offices, dormitories, and dwelling-houses, from the cottage to the mansion. Design and specification post free on application.

TESTIMONIALS.

"9 Victoria Chambers, Westminster, S.W.: June 10, 1884.

"SIR,—I have much pleasure in testifying to the efficiency of your patent warm-air fire grate. It has been very successful, and given every satisfaction where I have used it. Yours, &c.,

"To Mr. Grundy. JAMES WEIR, F.R.I.B.A."

"6 John Street, Bedford Row, W.C.:
"December 16, 1885.

"DEAR SIR,—I have now had an opportunity of testing your patent grate, and am glad to be able to say that I am most agreeably disappointed, because, as you are aware, I was rather sceptical about its powers when you showed it to me; but now I can say it answers admirably, and heats abundantly my porch-conservatory.—I am, yours truly,

"R. S. LANDER, F.R.I.B.A.

"To Mr. John Grundy."

From James Garry, Esq., Architect, West Hartlepool, July 1884.

"DEAR SIR,—I have very great pleasure in stating that the first stove, or patent warm-air ventilating fire grate, adopted by me in school at Seaton, and a second in a Cocoa Palace, have given such satisfaction that I now order eleven to be inserted in New Upper Grade Schools in course of erection at West Hartlepool. They are the most economical, efficient, and easily managed stove at present before the public.—Mr. John Grundy."

From Hon. and Rev. G. G. C. Talbot, M.A., Withington, Cheltenham.

"DEAR SIR,—You will be gratified to hear that the school is completely warmed by your new grate. It is the most economical and efficient that I have ever seen.—Mr. John Grundy."

Society of Architects, Architectural and Building Trades Exhibition, 1885:—"5 Great James Street, Bedford Row, May 1.—The warm-air ventilating grate shown by Mr. John Grundy at Stand 75 Floral Hall, is an admirable contrivance for utilising the heat conducted through the back and sides of the stove, for warming schools and buildings by a supply of freshly warmed external air."

Apply to JOHN GRUNDY, 30 Duncan Terrace, City Road, London.—Works: TYLDESLEY, near Manchester.

Agent for Scotland, SEPTIMUS HARPUR SMITH, 1 Upper Gilmore Place, Edinburgh.

Acknowledged by all MUSICAL AUTHORITIES and by all those who have had them in use for years to be

THE BEST

FOR TONE, TOUCH, GENERAL FINISH, AND GOOD VALUE.

Wholesale and Retail Depot :—London, 211 Regent Street, W.

The Celebrated "DUBOIS" Hydraulic Drawn Lead TRAPS and BENDS.

The above Shapes and Sizes always in Stock, and we are prepared to furnish SPECIAL SHAPES to order at short notice. These justly celebrated TRAPS are made from Pure Pig Lead by Hydraulic Machinery after the manner of Lead Pipe, and have peculiar advantages appreciated by every Plumber. They are greatly superior to either Cast or Hand-made Traps, as they have no SEAM, are of UNIFORM THICKNESS. PERFECTLY SMOOTH INSIDE AND OUTSIDE, and can be FLANGED, PLUGGED, and STRETCHED, without fear of SPLITTING. No possibility of Sandholes.

FOR PERFECTION OF MANUFACTURE THESE GOODS ARE PRE-EMINENT.

For Sale generally by the principal Lead Merchants and Wholesale Dealers in Plumbing and Sanitary Appliances throughout Great Britain and Ireland.

LONDON DEPOT:—S.W. RY., RIVERSIDE, NINE ELMS.

MELBOURNE INTERNATIONAL EXHIBITION, 1880, THE GOLD MEDAL
In addition to FIRST-CLASS HONOURS, was awarded to
JAMES CARTLAND & SONS,
Cabinet Builders and Naval Brass Founders,
BIRMINGHAM.
London Show-rooms: 40 Holborn Viaduct, E.C.
The extent, variety, quality, and finish of articles manufactured at this establishment cannot be excelled.

CARTLAND'S PATENT HELICAL, CLIMAX DOOR SPRINGS & HINGES.

CAUTION.
Ironmongers, Builders, and others are requested to see that the Trade Mark is on each Spring, as the Patentees are informed that spurious imitations of the
"CLIMAX SPRING HINGES"
are being sold, which have neither the Power or Durability of Cartland's Patent Climax Door Springs and Hinges.

2401. 2860

Pattern Books, both full size and Miniature, containing every information, may be obtained through any Merchant or Factor on application. All Goods for Export are carefully packed in Cartoon Boxes, and distinctly labelled with orange-coloured labels, bearing our Trade Mark, as above.

COLES, STEWART & CO.,
STOCK AND SHARE BROKERS.

Messrs. COLES, STEWART & CO. undertake every description of Stock Exchange business, and have special and early information on all leading Stocks; they are also continually advised by telegram from the chief Mining centres, both at home and abroad. For Investment Messrs. C., S. & Co. make only one charge of $\frac{1}{16}$ per cent. commission on all descriptions of Stocks, and open Speculative accounts with from 1 per cent. cover and upwards, without any further risk or liability to their clients whatever.

THUS, £5 commands £500 Stock; £10, £1,000 Stock; £50, £5,000 Stock;
And so on to any amount.

In the transaction of speculative business Messrs. C., S. & Co. make no charge for commission or brokerage whatever unless their client makes a profit, when they take 5 per cent. of the profit made as their remuneration.

All transactions advised by wire as soon as completed. Monthly Circulars and Mining Reports post-free on application.

TRADE NOTES.

MR. JONES, art metal worker, of Walker's Croft, Manchester, has just completed and fixed two pairs of gates, two single gates, and the whole of the railings of the new General Post-office, Manchester. On inspecting the work on Wednesday last we were very favourably impressed with the effective appearance and handsome design of the gates. The work has been carried out under the supervision of the architect to the building, Mr. Henry Tanner, of H.M. Office of Works.

TWO "latten" brasses, mounted on Belgian marble, one to the memory of William, Baron Brougham and Vaux, and the other of Eleonora Brougham, the mother of the whilom Lord High Chancellor, have been forwarded to Brougham from the works of Mr. Gawthorp, of Long Acre, London.

GUIDE village, with about five hundred inhabitants, is situated above the highest reservoir of the Blackburn Corporation Waterworks. Mr. J. B. McCallum, C.E., the borough and water engineer, Blackburn, has recently put down two of Blake's patent hydraulic rams, capable of forcing about 30,000 gallons per day to a service tank about three-quarters of a mile from the rams and 170 feet higher. The waste water from the rams gravitates to an adjacent reservoir. Mr. McCallum reports well of the working and efficiency of the rams.

AT the last meeting of the Committee of the Institute of Auctioneers and Surveyors of the United Kingdom, Mr. Klenck, of the firm of Messrs. J. M. Klenck & Co., in the chair, the following resolution was carried, on the proposition of Mr. E. Ingham, seconded by Mr. G. Stanham:—"That no officers be appointed by this Committee, but that the appointment of all officers be left to the Council to be elected by the members."

IN consequence of the great increase in the old and well-known business of Edwin Lumby, Son & Wood, Halifax, makers of welded boilers for hot-water heating apparatus and safe manufactory, it has been converted into a limited company under the style and title of "Lumby, Son & Wood, Limited." The capital is 40,000*l.* in 8,000 shares of 5*l.* each, of which it is only proposed to call up 3*l.* 10*s.* a share. The management will remain exactly as before, and the vendor, Mr. Percy Wood, takes 2,000 shares in part payment. Prospectus and form of application can be obtained from the bankers, the Halifax Commercial Banking Company, Limited.

WE notice that the prospectus of the Tesselated Floor Covering Company, Limited, of 74 Coleman Street, E.C., has just been issued. The company, which is fully subscribed to, proposes to take over the patents of Messrs. Hands & Bonny, referring to improvements in floor covering, in the shape of tiles claimed to be noiseless and ineffaceable, and easily restored.

NOTES ON NOVELTIES.

Terp's System of Boring Wells.—During our visit to the Brewers' Exhibition, which closed on Saturday last, we were particularly interested in the display of machinery for pumping, made by Mr. Olaf Terp, of 25*l* High Holborn. We understand that Mr. Terp intends executing artesian well borings in England, after an entirely new system, which has been successful on the Continent. The Continental press speak of the excellent results obtained by this patent, and especially the *Cologne Gazette* of January 23, 1886, which states that "at the brewery at Geistingen, at a depth of 200 feet, sufficient water was found, in a comparatively short time, to supply the whole wants of this large brewery, and at a very little expense and labour." The main object of Mr. Terp, in conjunction with Mr. Henry Schaefer, the commercial manager of the firm, is to do the borings on their simplified system quicker than has been known hitherto, and consequently involving less outlay and labour. By the aid of their casings of the wells, they effectually prevent any bad water from the first upper strata filtering through and mixing with the pure water rising from the bottom of the well. What has long been wanted is a process for obtaining really good and pure water, this being obtained through artesian well boring, which apparently has been brought to a certain perfection by the system Olaf Terp. We feel confident that this firm will acquire a certain notoriety in this particular class of work. At the present moment they are executing a well to supply the South London Brewery of Messrs. Jenner & Sons, in Southwark Bridge Road.

LOFTS' PATENT STOVES

Will burn any kind of Coal or Rubbish, consume their own Smoke, and require only one-fifth the Fuel of any other Store.

After four years of tedious experiments I have been able to produce what has long been required, viz., Domestic Stoves which consume only one-fifth the quantity of Coal (*One Ton instead of Five*) required by any ordinary stove, at the same time giving as great an amount of heat and more thorough ventilation. I have great confidence in recommending these to the public. Since perfecting them I have tried them for six months in the worst of smoky chimneys, and they have not failed in any one case; have shown them at work to a large number of scientific, medical, and practical men, and they have given but one opinion, which is that, as regards heat, health, and comfort, they are perfection, and they have not seen or heard of anything to equal them. The fire-grate is perfectly open, like the register or slow-combustion stoves now in use; they are neat, strong, and easy to understand; will burn any kind of coal or rubbish; **consume their own smoke**; are lighted just in the same way as an ordinary stove, and draw up as quickly and as easily.

Full particulars on application.

To be seen in action at London Show-rooms, 165 Queen Victoria St., E.C., or at Cambridge.

HARE & CO.

THE development of wood-engraving into high art is exemplified by the work for which this firm is so well known. Practically, the great improvements in this department have had their origin with Messrs. Hare & Co. half a century ago, and nothing but emulation has caused the appearance of so many firms claiming to be wood-engravers. Their success has been gained by great superiority in work. It may be said, in short, that the employés of the firm, the draughtsmen and engravers, are artists *con amore*, educated to the requirements of every class of trade or profession. In the engineering trade, for instance, thoroughly capable men are retained, who have made a study of it, and who know every detail. Most of the prominent engineering catalogues in the country are executed by this firm, and splendidly executed they are. In a large proportion of newspapers and journals the illustrated advertisements are the work of Messrs. Hare & Co., and the great improvement in the get-up of these—the new ideas in design which the firm volunteer to advertisers—are to be attributed to this firm. As a supplementary business, Messrs. Hare & Co. have adopted a process of photo-gravure which is sure to meet with general favour. It consists in being able to reproduce from photographs, oil-paintings, wash-drawings, or in fact any definite copy, with excellent effects. Its advantages come in where wood-engraving is unnecessary. For instance, any firm possessing a photo of an exhibit, say, or drawing, can avoid the expense of wood-engraving by having them photo-gravured. A plant for the new process is being put down at Bolt Court, Fleet Street, and it will no doubt soon be pressed to meet the demand.

WESTON-CROWLEY'S PATENT GEARED PULLEY-BLOCK.

MESSRS. JOHN CROWLEY & CO., of Sheffield, are the manufacturers and joint patentees of this improvement on pulley-blocks. Its merit is in being an addition of gearing to their original differential system. It will rather surprise some of our readers to learn that by this small pulley one man can lift several tons as if they were pounds. This we have seen done at the firm's works in Sheffield. The main idea of the Weston-Crowley system is a small, convenient, and simple pulley, in fact as simple as the tackle block of old. The difficulty of inserting the hook into the eye-bolt ring or suspending sling—making the overhead fixing a matter of no small doubt—is obviated in this patent by the absence of a wide-spreading sprocket-wheel and all other projecting attachments. We quote a description of the patent in the firm's circular:—"Like the plain Weston differential pulley, and also like its simple wooden antitype, the new geared block has its general figure and largest dimensions limited to the diameter of the main shears. Within such moderate space, however, is contained the effective gearing of a double-purchase crab, *i.e.*, two pairs of wheels and pinions well enclosed, and an operating sprocket wheel." We have inspected this patent geared pulley-block, and have seen actual tests, with most satisfactory results. It is an immense economy of labour. Another feature is that the firm will guarantee their pulley-blocks to lift a specified weight, and subject them to severe tests before leaving the works. We should decidedly recommend them in preference to many of the complicated and unreliable pulleys in the market. The patent geared pulley-block should be admirably suited to the requirements of contractors, and our readers generally. We must mention that Messrs. John Crowley & Co. are engaged extensively in the manufacture of malleable castings of all descriptions, for which they have separate works in Sheffield.

MESSRS. P. & W. MACLELLAN, GLASGOW.

THE new premises of the enterprising and well-known firm of Messrs. P. & W. Maclellan, of Trongate, Glasgow, and the Clutha Ironworks, form one of the most important commercial improvements in the city. The new building has a frontage of 72 feet 6 inches to Trongate, the front elevation being modern Italian, three storeys high. The style of architecture would be pure modern Italian were it not for a mixture of stone and iron-work, which forms one of the principal features of the building. The front building, which runs back 50 feet, is on the ground flat divided into spacious shops and saloons, and upon the flats above, warehouses and offices, and in the rear of this is an immense three-storeyed galleried warehouse, running about 150 feet, lighted from a centre-arched glass roof, which most successfully throws a flood of subdued light on to every article and into every recess, the total space covered being an acre of ground. Messrs. John Baird and James Thomson have been the architects. The contracts were secured by Messrs. Morrison &

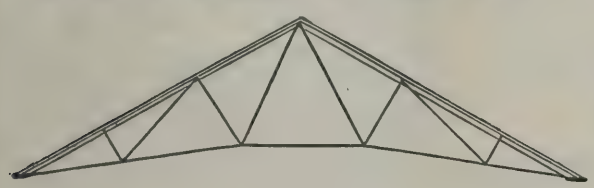
Mason, Anderson & Henderson. The malleable iron girders and other work of a like kind were furnished by the proprietors, whilst the ornamental castings were produced at the Saracen Foundry.

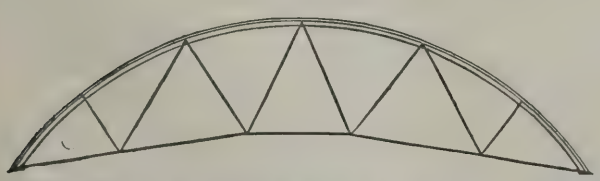
PORT SAID BRITISH HOSPITAL.

LAST week the hospital buildings constructed by Messrs W. H. Lascelles & Co., of Bunhill Row, E.C., were inspected at the works of the firm previous to shipment to Egyptian soil. The hospital has been built from the designs of Viscountess Strangford, to whom the realisation of the scheme owes so much, and is a commodious airy structure of one storey, admirably adapted for the Egyptian climate. It consists of two wings, one on each side of an open passage, and united under one roof at the entrance. The material used is Baltic fir, which will be painted outside and varnished within, and what first strikes all visitors is the loftiness of the various apartments, an important consideration when the destination of the building is borne in mind. At present the hospital is planned to contain thirty beds, but more patients could be accommodated on an emergency. In all there are five wards, the principal of which is 38 feet long by 28 feet wide, and the average height of the various apartments is 10 feet to the eaves, or 19 feet to the top of the ridge. The whole of the building stands on a frame, which will rest on concrete pillars 4 feet above the ground, so as to allow of a free draught of air underneath. Inside the rafters of the wards and other rooms are lined with match-boarding, and the building will be entirely roofed with "Willesden paper," a light, durable, and waterproof paper. Besides the accommodation for patients, there are quarters for the resident doctor and three nurses, a spacious bath-room lighted from the roof, a kitchen and necessary offices, and the dispensary, which is in a sense apart from the hospital, and is intended to be of service, not only to the patients, but generally to the native inhabitants of the Delta. Round three sides of the building runs a veranda, approached from the wards and rooms by French windows. The flooring of the structure is "tongued," by which means it is made thoroughly draught-proof, but the floors of the verandas and over the open passage are latticed, to allow the rain-water to pass away. As the hospital now stands at Messrs. Lascelles's premises, Sugar House Lane, Stratford, it is "in frame," and ready to be put on board ship for transport to Port Said as soon as its several parts have been numbered and taken down. Though it occupies about half an acre of ground, and its construction has cost about 3,000*l.*, the whole work has been accomplished in eight weeks. The committee hope, and with good reason, that the building will be at Port Said, ready for the reception of patients, by Christmas.

THE PLUMBERS' COMPANY.

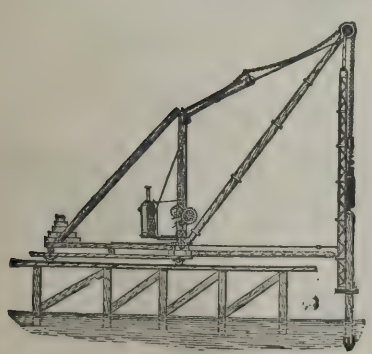


THE Lord Mayor presided at the third meeting of the General Council of the Worshipful Company of Plumbers at the Guildhall on Wednesday, for the purpose of receiving a report from the committee appointed to consider a scheme for the registration of plumbers. Mr. Alderman Stuart Knill, Master of the Company, said they had not been idle in their endeavours to carry out the resolutions passed at the last council meeting. There were certain matters that required legislative action, and these the committee and Court of the Company had under their immediate consideration, and hoped before long to succeed in carrying. Mr. George Shaw stated that applications for registration had come in not only from every quarter of London, but from almost every important district of the United Kingdom. The number of each class of applications dealt with by the committee up to Tuesday was—London masters, 149; provincial masters, 123; London journeymen, 280; provincial journeymen, 150—total applications dealt with, 702; and several hundred applications had yet to be considered.



THE PROPOSED EXHIBITION IN GLASGOW.

A MEETING, convened by the Lord Provost, was held in the Council Hall, Glasgow, on Friday, "to consult as to the proposed Exhibition, to consider the formation of a General Council, and to take other preliminary measures for organising the work." Lord Provost M'Onie presided.



Bailie Dickson, the Chairman of the Parks and Galleries Committee of the Town Council, said that the matter of the Exhibition had been remitted to that committee to make arrangements or to inquire into the propriety as to whether or not an Exhibition should be held at this particular juncture. This movement in Glasgow had been started some three years ago, when it was resolved that, if practicable, an Exhibition

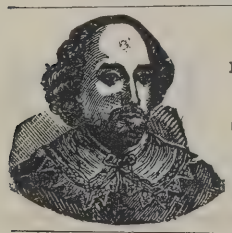
should be held in Glasgow; but, very unfortunately, Bailie Jackson, who was then at the head of the movement, became indisposed, and, in face of the depressed state of trade, it was felt unjustifiable to go forward and carry out the proposal. The Edinburgh people then stepped in, and he was betraying no secrets when he said that Edinburgh people had on all occasions expressed themselves in terms of the highest appreciation of the way in which Glasgow had assisted them; indeed, they questioned very much if the movement could have been launched in Edinburgh at the time but for Glasgow. The first difficulty the committee had to face was as to which year the Exhibition should take place; and in view of the fact that there was to be an Exhibition in Manchester in 1887, and one in Paris in 1889, it became imperatively necessary to fix it for 1888, or let it drop altogether. Then came the question as to what encouragement the committee would receive from the Town Council, and he need not say that that body entered into the scheme with a gratifying heartiness, and gave a guarantee of 5,000*l.* Bailie Shearer himself next inquired as to the support which the inhabitants would render, and in about a fortnight they had been guaranteed a sum of between 60,000*l.* and 70,000*l.* That was the answer which the public gave to those who thought this scheme should be delayed, and the unanimity of feeling on the matter was such as to indicate that there was an earnest desire that this matter should be carried forward, and all the gentlemen who had been approached by the committee had expressed their willingness to co-operate in every way they could to make the Exhibition a great success. They had, therefore, arrived at the stage that they had made up their minds to have an Exhibition; and the reasons for it were very obvious. In the first place, they hoped they were entering on a period when trade was beginning to revive. This Exhibition would be a help to that revival, for it would afford employment to a very large number of men, while the citizens would look forward to and anticipate good results from it. The most suitable site was the West End Park, and if the Exhibition were placed there he did not think they should have much difficulty in selling 30,000*l.* worth of season tickets. That was double the amount which had been sold in Edinburgh; but looking to the large population of Glasgow and the surrounding district, he thought they were making only a moderate estimate when they expected to double what had been done in Edinburgh. A sketch plan had been prepared by Mr. Carrick, giving 8½ acres to be occupied by the Exhibition—the Edinburgh Exhibition occupied eight acres—and the space to be enclosed was something like 39 acres, which was ample for outside amusement and recreation. Bailie Dickson then alluded to the advantages possessed by Glasgow for such an Exhibition, and concluded by expressing the hope that the outcome of the undertaking would be that some permanent benefit would accrue to the citizens.

Bailie Shearer pointed out that the amount guaranteed was double the amount which was guaranteed for the Edinburgh Exhibition. There were 5,000*l.* granted by the Corporation of Glasgow, four sums of 2,000*l.*, thirty-one sums of 1,000*l.*, thirteen sums of 500*l.*, twenty-six sums of 250*l.*; and since he had entered the meeting a number of gentlemen had stated their willingness to guarantee upwards of 1,500*l.*, so that they could say they had now a guarantee fund of 65,000*l.* The committee had received gratifying support from Glasgow manufacturers, engineers, and shipbuilders, who had also expressed themselves to the effect that so far as lay in their power they would surpass their previous efforts.

Sir Archibald Campbell, M.P., cordially supported the proposal to have an Exhibition in Glasgow, and he moved, "That this meeting approves of a National Exhibition being held in Glasgow in the year 1888, and agrees to request the Town Council to grant the use of such portions of Kelvingrove Park as may be required for the purposes of the Exhibition.

Mr. John Muir, in seconding, said that he believed the Edinburgh people would as cordially support this Exhibition as the Glasgow people had supported the Edinburgh Exhibition.

The resolution, on being put to the meeting, was adopted unanimously.



GLASGOW CATHEDRAL.*

THE first impression produced by the Cathedral of Glasgow upon any one having some knowledge of Gothic architecture is that it is a building of the thirteenth century, which has been erected probably in the course of one generation. There is a quiet dignity about it, and an all-pervading simplicity and harmony which we do not naturally associate with the architecture of later periods. On looking at it one is irresistibly reminded of Andrew Fairservice's exclamation, "Ah! it's a brave kirk—nane o' yer whigmaleeries and curliewurlies, and open-steek hems aboot it—a' solid, weel-jointed mason

wark that will stand as lang as the warld, keep han's and gunpowther aff it." But on closer examination we find that, like most other cathedrals, it exhibits great variety of detail and specimens of every style of architecture practised from the twelfth century down to the seventeenth. You will readily understand that this variety throws considerable light on the history of the building, and even occasionally on contemporary history, for the peculiarities of the styles infallibly indicate at what time the portion of the building displaying these peculiarities was erected.

For example, if you look at the capitals and ribs nearest the door by which you entered in this apartment (the chapter-house), you will see that they are entirely different from those on the opposite side. Now, we know that capitals like those near the door were not invented, if I may so speak, till the early part of the thirteenth century, and that towards the close of that century they had completely gone out of fashion; and we also know that capitals like those on the north side were not invented till the beginning of the fifteenth century; so that even if we had no other record we could tell that this apartment had been built about two hundred years after that north wall of it had been finished. Guided in this way by the architectural features presented to us, we learn that the work of erecting the Cathedral as we have it now extended over a period of nearly three hundred years.

You have heard people say, I dare say, that we could not do anything like this nowadays; but I rather think people who make such a remark do not consider that to have the same chance with our Mediæval brethren we should be allowed three hundred years to do it! The truth is we have no patience in these days. If you wanted a cathedral like this, as large and massive, and I told you that it would not be finished within fifty years, you would think that an absurd idea. You would wish to impose penalties upon the contractors if they exceeded a limit of, say, ten years; and I admit that in that way it would be impossible to get such a work as this. But this was not done in that way. But there was one hindrance to the rapid growth of cathedrals in days of old which I think you would find still to be a drag—that is, the want of money. We find constant references to this want in Mediæval records, and accounts of various devices for "raising the wind." We almost wonder that the idea of a fancy bazaar, opened by a royal princess or a member of Parliament, did not occur to the perplexed chapter! Of course, they had an excellent substitute in the sale of indulgences—a device no longer available. In these days we go anywhere else than to the Church for our indulgences. But the difficulties of the Mediæval workmen really enhanced the value of their work. It is not merely on that account more valuable intrinsically to the archæological student, but as a monument of good work done by successive generations of our ancestors, radiant with the record of sustained faith and indomitable perseverance, it stands invested with an interest—I may say a pathetic interest—for us which, if reared in happier circumstances, it could never have possessed.

I have said that we can tell the age of any Mediæval work from the character of its details. This is true of all British work; but it is proper to notice that after the thirteenth century the development of Gothic architecture here did not follow exactly the same course as in England. From the time when Edward I. honoured Glasgow with a visit, onwards almost to the Reformation, our relations with the sister country were not amicable, to say the least of them, and our ecclesiastics being not only patriotic, but also jealous of the pretensions of the English hierarchy, were naturally averse to follow English fashions in architecture; and so we find that about that period the styles diverge and become dissimilar, and a knowledge of the two varieties becomes necessary to enable us to understand the sequence of the styles in the two countries. The place where we are now assembled offers a very good illustration of this. No one acquainted only with the cotemporaneous architecture of England would imagine that this was erected towards the middle of the fifteenth century. Still less would they think it possible that Blackader's crypt, which we shall presently see, was not erected till near the close of that century. There is not a trace of the familiar Perpendicular forms about it. Indeed, it is a remarkable fact that although we have in this Cathedral a good deal of fifteenth-century work, we have not a single example of the Perpendicular style, as practised in England. Even the late screenwork between the nave and choir is late French, not late English.

Although Glasgow Cathedral is one of the smallest in Great Britain, in one respect it excels all others—that is, in the beauty of its crypt, which is altogether unique. Most of the other British crypts are of an earlier date, with Norman or Transitional piers and plain bold ribs and vaults. One of the finest of these is at Canterbury, and we have the remains of what must have been a still more beautiful crypt, of somewhat late date, at York. Crypts seem to have been fashionable in the twelfth century, and it is probable that the idea of having a crypt here dates from that period, for there can be no doubt

FRENCH LIBRARY OF ART.

JUST PUBLISHED. Handsomely bound in Cloth, Broché, 24s.; Relié, 28s.

LES STYLES.

OVER SEVEN HUNDRED ENGRAVINGS OF DIFFERENT PERIODS, WITH DESCRIPTIONS

BY PAUL ROUAIX.

"This large and sumptuous book is issued by the publishers of *L'Art*, a journal which we have frequently referred to as being one of the best publications of its kind in Europe. The French Librairie de l'Art has been known for long in connection with works treating of the fine arts, and *Les Styles* is certainly equal to anything we have ever seen of the kind, and by far superior to the vast majority of similar works issued in this country. There is something about the atmosphere of France which confers refinement of taste in everything relating to designs, and so pronounced is the national aptitude for discovering beauty and symmetry, that the very fact of a book coming from across the straits is generally a sufficient guarantee of the artistic excellence of the contents.

"M. Rouaix treats of many species of decoration, commencing with that in vogue amongst the ancient Egyptians, and proceeding in regular order of date with the Etruscan, Greek, Byzantine, Roman, Gothic, the peculiar ornamentation of the Renaissance, and of the times of Louis XIII., XIV., XV., and XVI. Before each division the author introduces a short historical introduction, and afterwards, by means of a series of beautifully executed prints, illustrates the prevailing fashion of the time. For this purpose he has levied contributions on examples of architecture, carving on wood, suits of armour, bas-reliefs, tapestry and embroidery, mural painting, mosaical work, and a host of other subjects, including caskets and chalices. In fact, anything that can be called artistic and assigned with certainty to a particular era is represented, the result being an exhaustive and exceedingly pretty production."—Book Lore.

FANTAISIES DÉCORATIVES.

BY HABERT DYS.

LONDON: GILBERT WOOD & CO., 175 STRAND.

that there was a crypt erected here towards the close of the twelfth century, several fragments of which still remain. These are our oldest architectural remains, and none of them are older than 1174. Nothing has been found to indicate what kind of church stood here before that date, and it is somewhat singular that we have not even a sepulchral slab as old as several which may still be seen in Govan churchyard.

You have no doubt heard that this Cathedral was founded by St. Mungo, but I need hardly tell you, after what I have just said, that we know nothing about St. Mungo's church, if he ever had one, which I think very doubtful. It is probable that we are indebted to St. Mungo for the selection of the site, though tradition would have us believe that the selection was due to the direct interposition of Divine providence. I may remind you of the legend, which may possibly have had some foundation in fact. We are told that in his journeyings St. Kentigern (alias St. Mungo) lodged one night with a holy man named Fergus, to whom it had been revealed that he would not die till he had seen the holy Kentigern. That same night Fergus died; and in the morning Kentigern had his body laid on a car, to which were yoked two wild bulls. These he commanded to go to the place ordained of the Lord. Of course they were obedient, and off they went, followed by the saint and a great multitude. They finally stopped at this spot, where it is said a cemetery existed which had been consecrated by St. Ninian. There the body of Fergus was buried, and there Kentigern took up his abode. In connection with this it has been pointed out by Mr. Andrew Macgeorge that on the vault of Blackader's crypt there is a representation of Fergus on the car, and an inscription indicating that that part of the building was dedicated to him. But I must not wander beyond the limits of authentic history, which are, I may say, coincident with the restoration or constitution of the See of Glasgow, by David, then Earl of Cumberland, which included Strathclyde, in 1120. Previous to that the Celtic church—the church of Ninian, and Fergus, and Kentigern—had almost ceased to exist, and the term bishop was only beginning to acquire its present significance. The constitution of the diocese of Glasgow was confirmed by the Pope in 1172.

When Bishop Joceline came to the See in 1174 he found that the old church erected by John, the first bishop, had been destroyed by fire, and he commenced a new one, which was completed in 1197. The finest example of a building of that period which we now have in Scotland is the nave of Jedburgh Abbey. Joceline's church was in the same bold and beautiful Transitional style. Of this, as I have already said, only a few fragments remain, which we will see presently. But it is quite possible that the nave may have been commenced either by Joceline or his immediate successors, though, upon the whole, more likely that it was the work of Walter, 1208-1232. The base of the nave, with its simple splays, is distinctly older than the base of the choir; and the bases of the shafts on the bench table of the aisles, with their delicate mouldings and square plinths, belong to an earlier period than anything to be seen in the choir. But the nave was never completed in the style in which it was commenced. It was carried up a certain height—rather more on the north than on the south side—and then left at a standstill for many years while the crypt and choir were being built. These were begun by Bishop Bondington, and completed during his episcopate—probably about 1250—and after that work on the nave was resumed; and thus it comes about that while the lower part of the nave is older than the choir the upper part is later.

It seems at first sight rather puzzling to find that there was a church, erected by the first bishop, John, and consecrated in 1136; then another, erected by Joceline, consecrated in 1197; and again another, built by Bondington in 1250—that is, three new cathedrals within a period of about one hundred years. But we should see that the explanation is simple if we could only realise the condition of affairs in Strathclyde during the twelfth and preceding centuries. Conflicting tribes of Celtic and Teutonic origin had desolated the country, and swept away almost every trace of civilisation and religion. Achaius, when he came to his See, found that he had neither need for a large church, nor means to build one. He had, in short, a great charge, but no congregation. He had to begin the work of converting the natives almost *de novo*, and was as truly a bishop *in partibus infidelium* as our esteemed friend the present incumbent of St. Mungo's would be if he were consecrated Bishop of Berber or Uganda. If our reverend friend found himself thrown upon his own resources amid "pagan superstition or Mahomedan delusion" in such a diocese, he would be able to sympathise with the trials and difficulties of his illustrious predecessor here. It is recorded in the "Inquisitio" of David that Bishop John, "when he came to know the barbarity of these unhappy people, and the multitude of their abominable sins," was a good deal affrighted, and resolved to go off to Jerusalem, but the Pope caught him and consecrated him and sent him back to his See. Now, I don't know whether or not Bishop George would be "affrighted" by the manners and

customs of the natives of Uganda, but I have not the least doubt that if he did settle down to his work among the heathen there he would do in the way of cathedral building exactly what Bishop John did here—he would erect the plainest and cheapest tabernacle which would serve his purpose, and if it did happen to get burned down by-and-by it would be no great loss.

But Jocelin was much more happily situated than his predecessor John. Through the influence of David, a great part of the ancient endowments of the church of St. Mungo had been recovered, and the nobility and freemen (for there were slaves in those days) had adopted the fashionable religion. Besides this, Glasgow itself had increased in importance, and was now thought worthy of being erected into a burgh of barony; and when the old church was burnt down it was both necessary and possible to erect one on a grander scale. Some of the most beautiful buildings in England and Scotland were erected during the episcopate of Jocelin, and there is no reason to doubt—indeed we have still some indication—that the crypt and choir which he built were worthy of the age. They were too small, however: most of the choirs built about that time were too small. I do not remember one of that age which was not within the next century either added to or rebuilt.

It is possible that Jocelin's nave was projected on a sufficiently large scale, but his choir did not at all come up to the ideas of Bishop Bondington, an able and energetic man, who succeeded to the bishopric in 1233. He seems to have made considerable changes in the constitution of his chapter, taking that of Salisbury for his model; and he introduced the Liturgy of Sarum, which continued in use in the diocese till the Reformation. We can quite understand that a man of that stamp was not likely to be content with half-measures. He found Jocelin's church, which had only been in use for about forty years, unsuitable, and instead of attempting to add to it he resolved to sweep it away entirely, and to erect another in its place. We can never regret his decision, as he obtained—where, we know not—a truly magnificent design, which seems to have been carried into execution, as we see it, in about twelve years. He would naturally commence operations at the east end, clear of the old church altogether, and in this way the use of it might be continued while a large amount of work was done. Then he would remove first one part and then another, till at last only one little bit remained, which somehow got built over and incorporated in the new work, like a fly in amber, and remains in the south-west corner of the crypt to the present day. After the completion of the choir the nave was recommenced and carried on vigorously. The central tower was ready for roofing about 1300, and the nave some time after that.

The next important addition to the building was the sacristy or vestry, now erroneously called the chapter-house. The lower part seems to have been erected by Bishop Lauder about 1425, and the upper part by his successor, Bishop Cameron. It is, I think, probable that the consistory-house, at the west end of the Cathedral (now removed), was also erected by Cameron, and that the old west tower, now also unfortunately removed, was erected somewhat earlier. The only other addition of any consequence was the south crypt, erected by Bishop Blackader about 1500. This is a very remarkable building, in that from the outside it looks more like Early English work than sixteenth century, and inside there is no trace of Perpendicular work; we have an elaborate design, with good, full mouldings, but rather coarse workmanship. The contrast between this and the great crypt in this respect is most striking. There are few Mediæval monuments in the Cathedral. There are several stone coffins under the floor of the choir, and two standing on the floor of the crypt empty; and there is only one recumbent effigy, which was long supposed to be St. Mungo himself, but which I think has been identified as the effigy of a distinguished prelate and patriot, Bishop Robert Wiseheart, who was released from an English prison after the battle of Bannockburn, and was buried here in 1316.

The delegates afterwards, under the guidance of Mr. Honeyman, made a detailed examination of the Cathedral. At the close of the inspection Mr. Honeyman was awarded the hearty thanks of the party.

FIRE INSURANCE AND BUILDING.*

He would be a bold man who would assert that any building could resist any conceivable fire. But we may assume as proof against all assault from all probable fires a type of building with which we are growing familiar. These, constructed with brick walls and iron well covered with fire-clay, with floors made of fire-clay arches, without galvanised iron, wood, or other destructible outside decoration, whose whole accessible structure, in short, has been made in the fire, these

offer the nearest approach to absolute security from fire of anything since Mark Twain's coal mine.

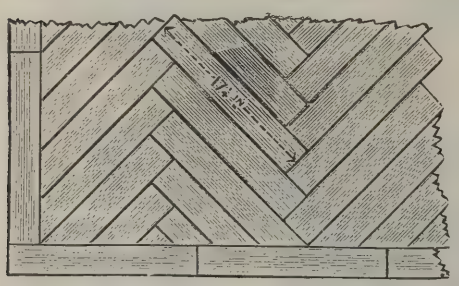
But apart from these very costly structures designed to be absolutely fire-resisting, there is a large class of slow-burning buildings which, when erected in large groups in a city, form a practically fireproof neighbourhood, each individual building of which can be readily saved in case of fire. It is this class to which our attention should be more particularly directed. First let us glance at a few building materials, and then at their method of application.

Considered in their fire-resisting qualities, the first is fire-clay. This material has become of late years an invaluable adjunct to various classes of buildings, and it is safe to say that the near future will see it used in a vast number of directions now scarcely dreamed of. In its various forms it may be so cheaply made and so easily and inexpensively applied that there is no excuse for our relative indifference to it. It can be made in forms vastly lighter than brick, and consequently can be used in many cases where for reasons of support a brick wall is not possible. Moreover, being made in hollow or porous forms, its air-cells make it an ideal non-conductor of heat, and, consequently, but none the less valuable, an admirable "non-conductor of cold." On the cheaper methods of its application we will touch later in this paper.

Brick, as the next of these fireproof materials, must probably always hold its own. The cheapness of its manufacture, the ease and certainty of its use, the satisfactory artistic results obtained from its finer forms, all make it now what it was to the Romans, among the noblest of building materials. Terra-cotta is, of course, classed as brick, being in all respects a merely special form of brick, but better tempered in the clay, more carefully moulded, and more thoroughly burned than most brick.

Iron has not held its own in the list of building materials. Of course we cannot do without it, but it is always to be distrusted when freely exposed to the possible action of fire. Any high degree of heat in great measure impairs the efficiency of the material, or at best renders it liable to fracture under the sudden action of cold water. In the case of girders of wrought iron, especially when exposed freely on three sides, the danger from heat is peculiarly great, because the tensile resistance of the metal is so much lessened. Even if under this weakened resistance of either iron beams or girders the deflection is inconsiderable, it will probably be enough, in the case of girders, to drop the floor-joists resting upon them, or in the case of columns, to throw the direction of weight out of the axis of the column and so break or overturn it.

Many of our shop-fronts are built on iron girders carried across from post to post at the line of the second floor, and freely exposed. Here, although the chances are in favour of stability, yet the security would be greater if these iron girders or lintels were covered with terra-cotta or fire-clay. If the iron lintels have no essential work to perform, as in the case of several of the newer large buildings, they may be safely left unprotected. For these and similar reasons iron cannot be regarded as an ideal fireproof material, especially when it is remembered how intimately connected all the parts of a building often are, and how fatal to the entire building may be the failure of one of its parts.



In all architectural work where iron has considerable weight to carry, it should therefore be protected from heat. The best thing for the purpose is probably some one of the various forms of fire-clay in common use. But when these are not to be obtained, or are for any reason too costly, a covering of asbestos in paper or fibre, or even of wood, provided the wood clasps the iron without intervening air-space (this condition is essential), is better than nothing.

The mechanical devices for applying fire-clay to iron may be obtained for reference from any one of the several firms engaged in this business.

Stone is now, as it has always been, the highest of all materials for building. Nothing can compare with it for the dignity of its expression and the facility with which it lends itself to all varieties of architectural expression. But regarded as a rival of iron in either its fire or time-resisting qualities, it must be conceded that it must take the second place.

Whenever stone enters very largely into the structure of a building, it is of the utmost consequence to know by actual test what is its action both under the direct contact of flame, and when suddenly cooled off by water. Nothing is stranger than the widely different performance of stone under fire, and I know of no means of predicting with anything like finality what a given kind of stone will do. Underwriters as well as architects are interested to see that all quarry owners furnish with their stone, not only tests of its water absorptive power and crushing resistance, but also of its precise action under great heat. Until this be known, absolute dependence on the integrity of a given kind of stone is unwise. This is especially true in walls faced with stone, and in piers of brick bonded with stone. In the first case, if the stone facing disintegrates

BY HER MAJESTY'S ROYAL LETTERS PATENT.
ESTABLISHED A.D. 1774.
AUSTIN'S
NEW IMPERIAL PATENT
SUPERFINE FLAX LINE.
The above article is now being manufactured and sold in large quantities for Greenhouse Sashes, Public-house Shutters, and other heavy work. The Manufacturers would recommend it for its strength, and the large amount of wear in it, consequent on its peculiar manufacture.
AUSTIN'S IMPERIAL PATENT FLAX SASH AND BLIND LINES (two Prize Medals awarded). The manufacturers of the above articles particularly wish to draw the attention of the trade to their Imperial Patent Flax Sash Lines, of which they are now making six qualities, all of which they can strongly recommend, as they have given unqualified satisfaction to the trade for now over One Hundred Years; and the Proprietors continue to give their personal attention to the manufacture of these goods.
They also invite the particular attention of the trade to their IMPERIAL PATENT BLIND LINES, which are very superior to anything yet offered.
They can be obtained of all Ropemakers, Ironmongers, Merchants, Factors, and Wholesale Houses in town and country.
N.B.—Please note that all our goods as advertised above are labelled either inside or outside, with our Trade Mark—The "Anchor."

ESTABLISHED 1838.

under heat, the tendency is of course to make thinner places in the wall where this disintegration takes place, thus adding to the general tendency of the wall to fall outward. When, in the case of piers, the exposed edges of bond-stones are burned away, the efficient carrying area of the pier is reduced to a smaller and interior section, thus making it less safe, not only because of this diminished area, but also because few except such masons as built the wall of the New Jerusalem ever build the inside of a pier as well as the outside, and that part of the pier called upon to do the extra work is the part least able to do it. In all cases where stone, whose fire action is unknown, is used for piers, the pier should have considerable excess of size, and where such stone is used for wall facing, the brick wall which "backs" it should be thick enough for all the work necessary for perfect stability without the stone.

Wood is, of all material used in building, that most generally understood. Anyone who has, by slow and laborious degrees, learned to kindle a wood fire in an old-fashioned fireplace, knows by practice just how nearly fireproof wood may be. Wood, like paper, is very inflammable when cut thin and surrounded by an air space, but (always excepting certain highly resinous woods which burn under all conditions) when in large masses burns with comparative slowness. This peculiarity it was which made very slow burning a wood house constructed by the methods prevalent in England under Elizabeth and Anne, and in parts of New England in the early years of the last century. Wood, applied thus in large pieces, has the advantage over iron that the application of heat impairs its area only, without modifying the efficiency of the part which may remain, and the action of water upon it has no effect.

For these reasons it seems evident that for many purposes heavy solid wood posts and girders are preferable to a similar construction of unprotected iron—again assuming that we are not considering the few highly inflammable woods above mentioned.

Wood may also be protected by a number of cheap devices, which greatly add to its efficiency. Preparations of creosote and other substances are made into fireproof paints, which are often treated by both underwriters and architects with neglect, because they do not do what they seem to profess—make the wood fireproof. But this they do not or should not pretend to do. Their object is simply to retard combustion, and to sufficiently accomplish this is practically to solve the problem.

What has been said of wood has no relation to the use of it as we commonly see it, since, for reasons stated later on, the typical balloon-frame house, and the method commonly used in its construction, is just the principle used in the piling up of wood preliminary to a successful bonfire.

Asbestos is a material coming into larger use, from which we may expect results of importance. Whether used in fibre as a packing, or applied as a paper as an interlining, it is of very considerable value in retarding the progress of fire.

The same thing is true of such preparations of silica as "mineral wool," and of the substance called "fossil meal," and in an especial degree of plaster-of-Paris, whose use for fireproofing purposes is as general in Europe as it is rare here.

Two materials not yet in sufficient structural use to warrant an extended notice, but each possessing peculiar merits, are glass and paper. Glass is perhaps one of the most important of the building materials of the future, and its use will develop new applications of other materials for its protection from fire. Paper in various compressed forms will also come into more or less general use, and will have the greater advantage that in bulk it burns very slowly, and that in its preparation for use it can be readily treated by chemical processes, so that it becomes nearly fireproof.

This is a slight sketch of the relation of a few familiar materials to fire. But more important than their inherent nature is the method of their use.

What are the most prominent reasons for the total destruction of buildings by fire? I do not doubt that any man of experience would answer: first, facility furnished for the rapid and unobstructed spreading of flames, which we may call "flues"; and second, the falling out or in of parts of the burning building, which we will call "leverage."

First as to "flues." It matters very little what a house is built of if only sufficient opportunity is provided for flames in one part to swiftly communicate with other parts without burning the intervening material. And yet, by a hundred ingenious devices, these flues of communication are almost universally provided.

The typical American wooden house is generally constructed of light timbers set at small distances apart, and each timber has an open air-space on at least two sides of it, and often on three sides. The bottom of the flues thus constructed are frequently open, and generally open somewhere at the top; and in case they are closed at either the bottom or the top, the stopper is nothing more serious than a 1-inch board, or one thickness of laths and plaster.

The same thing is true of almost all brick houses where, for

IMPORTANT.—To Specialists, Manufacturers, and Others.

Effective Advertising at a Minimum Cost. Now in preparation for Publication in January. Demy 4to, Illustrated.

THE ARCHITECT AND CONTRACTOR'S COMPENDIUM

And Specialist's Directory for 1887.

EDITED BY JOHN E. SEARS, A.R.I.B.A., F.A.S.

An illustrated and priced catalogue and directory of specialities, manufactures, and requirements in every branch of the Building Trade, and in office and workshop, carefully classified and indexed, combined with an Office Diary, Legal and General Information, Copies of Building Acts and By-Laws, Tables, and Memoranda. Illustrations may be inserted produced by the Litho- or Ink-Photo process. In addition to the usual circulation of a first-class Annual, **the Publishers guarantee to send a copy gratuitously to every Architect and Builder whose name appears in the London Directory.** Advertisements will thus for twelve months be in a convenient and attractive form before the eyes of the people Advertisers specially desire to reach, and this **at a cost less than half that of sending out one circular.**

The minimum **guaranteed circulation** of the **Compendium** is 3,000 copies, but the actual circulation will probably reach a much higher figure.

Special attention is directed to the fact that, at great expense, the Publishers have arranged to illustrate this work by the magnificent **Ink-Photo** process, specimens of which are to be seen weekly in *The Architect.* The **Compendium** will thus be far ahead as an artistic production of any class Annual published, adding greatly to its value as an adverti-ing medium. The Ink-Photos can be produced, **without block,** from **any** drawing or photograph, and printed in any tint. The charges are very moderate, and will be quoted on application.

An exceptional opportunity is thus afforded Country and Colonial Firms to introduce their manufactures to the London market. The Compendium will be produced in first-class style, and will doubtless become a standard work of the trade.

Prospectus, with full table of contents, &c., free on application; but Advertisements and Blocks should be forwarded at once to the Advertisement Manager, 16 New Bridge Street, London, E.C.

London: JAMES SEARS & SONS, Printers and Publishers, Crane Court, Fleet Street.

reasons of cold and dampness, all inner surfaces of the walls have small wood strips set against them, to which are nailed the laths for plastering. This is, in America, the Universal Insurance Company Extinguisher, Unlimited. Generally, the entire house is run through and through with these flues, which are by no means confined to outer partitions, but with almost equal frequency core out all the inner partitions as well. Then, having thus carefully provided a good circulation for the flames, the ingenious builder often provides a large shaft or flue, open at both ends, and closed at each storey only enough to make a good draught, and this large supplementary flue he calls an "elevator shaft," or "soiled linen chute," or some other poetic and imaginative title.

Now, in all of these houses where is the fire first seen? Generally in the roof. Where does the fire start? Almost everywhere else. The bonfire thus carefully prepared has the peculiar merit of having each stick of wood provided with its own flue and draught, and the result is that the pile of sticks is at once burning at both ends. Is it cheaper to build this way? Not at all. The cost of the frills on one front gable or the crazy-quilt pattern of the stained-glass windows would change the whole thing. The only care needed is, first, to make the flue as nearly fireproof as you can, and second, stop it up with something that will not burn. At the line of the various floors run out a board between the studs of the partitions, or between the furring on the brick walls. Fill up on this board two inches deep with the mortar left from the masonry and plastering, and the difference between this and the common form of wood or brick house is that this house, if it catches fire, can be saved; the other cannot. If the wood studs or furring strips have an inner lining of asbestos paper, or an outer lining also for wooden houses or partitions, the security is just that much greater.

The same flue system is generally carried through the floors of buildings, where the space between floor joists from end to end is unobstructed. If this long space is cut into two or three fire-tight bulkheads by a piece of fire-clay tile or porous terra-cotta or brick—or, if there is nothing else, tin—the safety of the house is much enhanced.

Solidity is the measure of fire resistance in a house; "flue-idity" is the measure of its fire facility.

I can only allude to the principle involved here, which you will at once carry to its various conclusions.

Now as to the question of "leverage." Leaving out of question the ability of wall to stand alone and carry all the weight resting on it, the walls of buildings are generally forced over by some form of direct leverage. The floor joists or beams generally have with the outer wall some fixed connection which, when the action of fire causes the joists or beams to fall down, holds them to the wall, forcing the wall to "buckle" and fall out and in. The action of this force, of course, depends on how heavily the floors are loaded. But the mechanical advantage of a weight thus applied to the wall for its destruction is very great; and it is a wall or partition of very great strength which will not yield to it. Falling under the application of this strain, the wall need not necessarily fall altogether inward; part of it may fall outward. Indeed, if the strain be applied at the extreme top, or even at the bottom, several reasons may make the wall fall both ways. With the precise action of this force we have now nothing to do; but it should be insisted upon by you that some method of anchoring wooden joists to walls be used of such character that the falling of the joists shall free this anchorage and leave the walls standing.

Over and above this point should be more carefully considered in the same connection, the mere lateral tying together of walls, so that it becomes more difficult for one wall to break away from another. This involves only a small matter of cost—a few pounds of ordinary hoop iron well bonded into the walls being enough, but it often makes the difference between six and seven per cent. in the yearly dividends of your companies.

The suggestions I have felt at liberty to make in this paper are very few, and I have endeavoured, even at the risk of being commonplace, to be practical.

The essential element of the whole question of the relationship between architecture and fire insurance lies very much deeper than any details of either architecture or fire insurance. The relationship will be finally and happily adjusted at the moment when frank recognition of your interests by us is met by equally frank recognition and criticism of our work by you. The profession of underwriter cannot occupy its proper place alone. To give it its normal influence in the community, to insure its wider and deeper aims, it should enter with greater care and seriousness into the nature of the problems presented by that relationship we have been considering.

We, as architects, I trust you will find more and more willing to meet you half-way in this adjustment; and the result of our mutual understanding and concerted action I believe must be of great good to the community.

BRYANT, POWIS & BRYANT LIMITED,

"THE PEDESTAL VASE,"
JENNINGS' IMPROVED W.C. APPARATUS

(Combination Urinal and Slop Sink).

Registered No. 16,300.

A PORCELAIN VASE set on a tiled or mosaic floor, within walls or a dado of glazed tiles. The usual wood framing, forming a storehouse for the retention and accumulation of *damp*, *dirt*, and *disease germs*, with the joints, crevices, and imperfections in work which the closet enclosure so often conceals, is entirely abolished. The seat is hinged, permitting free access for use as a *slop sink* or *urinal*, and for cleansing, so that the entire apparatus and space can be freely washed down. For this latter purpose the floor should be slightly sunk, and laid to fall to a grating, with waste carried through the external wall, and terminating in a copper flap valve to prevent draught.

☞ The suggestions as regards wall linings and floor, may, of course, be modified as best adapted to the building in which the closets are used; and in the consideration of such details, alternative schemes will readily present themselves.

At the recent **HEALTH EXHIBITION** (South Kensington, 1884), amongst a series of official tests, under the supervision of Baldwin Latham, Esq., C.E., and the Jury No. 9, Class XXIII., and successfully withstood by this closet, the following may be cited in evidence of its efficient action. Being fixed in position shown in illustration, with **"JENNINGS' PATENT SINGLE FLUSH WASTE-PREVENTING SYPHON CISTERN"** 5 feet over, with 1½ inch down pipe, ten apples (averaging 1¼ inch diameter) and a flat sponge about 4½ inch diameter were thrown into the basin. The water, as well as the whole of the exposed or dry surface, was first blackened with plumber's "smudge," and the sides covered by four pieces of thin sanitary paper, which adhered closely to the soiled surface. The handle of the cistern was then pulled, and the two-gallon flush liberated. After seven seconds (the time occupied by the discharge), a receiver placed under the trap outlet was removed, containing in the blackened water **the ten apples, the sponge, and the four pieces of paper,** no traces of the soil remaining visible upon any part of the apparatus.

GOLD MEDAL AWARDED.

THESE CLOSETS are already in use in Hospitals, Banks, Hotels, Offices, Private Residences, &c., with most satisfactory results, and, fixed in the manner described, in appearance and action leave nothing to be desired. By the novel arrangement of the supply to Basin, as shown in the sectional sketch annexed, the whole surface is well flushed and cleansed, whilst the bottom of Basin and Trap are thoroughly scoured by a concentrated rush of water which insures the **instantaneous removal** of the contents, thus overcoming the inherent defects in the many imitations recently produced of **"JENNINGS' MONKEY-CLOSET"** (the **original form of wash-out watercloset**), which was invented and patented by G. J. in 1852.

A Business Supplement

The Contract Reporter.

to The Architect.

LONDON, NOVEMBER 12, 1886.

TENDERS, ETC.

*** *As great disappointment is frequently expressed at the non-appearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the office, 175 Strand, London, W.C., not later than 5 p.m. on Thursdays.*

Correspondents, when writing to notify an extension of time, or an alteration of the date of sending in Competitions or Contracts, are requested in their letter of advice to write at the head of the required change—"Contract Reporter to The Architect."

REGISTRATION OF PLUMBERS.

GUILDHALL, AUGUST 12, 1886.

1. In pursuance of the Resolutions of the following—
   (*a*) The Conference of Metropolitan and Provincial Plumbers held at the City and Guilds of London, Central Institute, in October 1884;
   (*b*) The General Council subsequently formed to give practical effect to the Resolutions of that Conference;
   (*c*) The Plumbing Trade of London assembled in general meeting at Guildhall, January 25, 1886.
2. A Register for Plumbers of the City of London, and a circuit of seven miles thereof, has been opened by the Worshipful Company of Plumbers.
3. The object of the Registration is to enable the public to distinguish between qualified and unqualified practitioners.
4. All applications are considered by a Special Committee of Registration, which includes Members of the General Council as well as practical Plumbers, in order that no trade interest or prejudice may operate against any Applicant, but, on the contrary, that the utmost fairness and impartiality may be secured to all.
5. Plumbers (Masters and Journeymen) established in the Trade prior to March 1, 1886, are not necessarily required to undergo any examination. Admission is granted to such Plumbers on satisfactory statement or proof of experience, according to the circumstances of each case.
6. All Applicants who cannot satisfy the Registering Committee of their experience are required to pass an examination by a Board of Examiners, composed largely of practical Plumbers.
7. No Plumber entering the trade after March 1, 1886, will be admitted to the Register unless he shall have passed an examination in the technology and practice of plumbing.
8. The Company is not connected with any Plumbers' Societies or Trade Organisations formed for other purposes, and the function of the Registering Committee is confined to distinguishing those who are fairly entitled to be registered as qualified Plumbers; the object being thus to raise the standing and efficiency of Plumbers as a body in a manner consistent with the important position they occupy in relation to the public health.
9. The Registration of the Plumbers of the London District is adopted as a preliminary step to the extension of the system of Registration throughout the Kingdom by means of Local Organisations.
10. Pending the establishment of Local Registers, Provincial Plumbers are admitted to the Company's Register on the same conditions as the Plumbers of the London District.
11. Plumbers admitted to the Register receive Certificates of Registration bearing the Company's Seal and Arms, A.D. 1588. None but the holders of such Certificates are entitled to use the letters R.P. (Registered Plumber) after their names. Lists of the names and addresses of Registered Plumbers are obtainable on application to the Company.

GEORGE SHAW, Master.

COMPETITIONS OPEN.

CARLISLE.—Nov. 20.—Designs, with Specifications and Estimates are invited for the Erection of Market Buildings. Premiums of 100*l.* and 50*l.* Mr. H. U. McKie, City Surveyor, Town Hall, Carlisle.

N.B.—Size and height of window no object.

TESTIMONIAL.
BANGOR, N. Wales: September 14, 1885.
Sirs.—I have pleasure in testifying that I have used Leggott's Silent Adjustments for various buildings to high skylights, fanlights, and top parts of windows, and in every case they gave satisfaction.
They are secure in whatever position, whether the window is open or closed, and are quite simple and workable in their action. I prefer them to any other that I have seen or used for the above-mentioned purposes.—I remain, yours obediently, R. DAVIES, Architect.
Messrs. W. & R. LEGGOTT, Bradford.

Mr. HARRY PEARCE, 125 Great Portland Street, London, W., is no longer our Agent. All direct communications shall have our prompt attention. W. & R. L.

IMPORTANT.—To Specialists, Manufacturers, and Others.
Effective Advertising at a Minimum Cost. Now in preparation for Publication in January. Demy 4to, Illustrated.
THE ARCHITECT AND CONTRACTOR'S COMPENDIUM
And Specialist's Directory for 1887.
EDITED BY JOHN E. SEARS, A.R.I.B.A., F.A.S.
An illustrated and priced catalogue and directory of specialities, manufactures, and requirements in every branch of the Building Trade, and in office and workshop, carefully classified and indexed, combined with an Office Diary, Legal and General Information, Copies of Building Acts and By-Laws, Tables, and Memoranda. Illustrations may be inserted produced by the Litho- or Ink-Photo process. In addition to the usual circulation of a first-class Annual, the Publishers guarantee to send a copy gratuitously to every Architect and Builder whose name appears in the London Directory. Advertisements will thus for twelve months be in a convenient and attractive form before the eyes of the people Advertisers specially desire to reach, and this at a cost less than half that of sending out one circular.
The minimum guaranteed circulation of the Compendium is 3,000 copies, but the actual circulation will probably reach a much higher figure.
Special attention is directed to the fact that, at great expense, the Publishers have arranged to illustrate this work by the magnificent Ink-Photo process, specimens of which are to be seen weekly in *The Architect*. The Compendium will thus be far ahead as an artistic production of any class Annual published, adding greatly to its value as an advertising medium. The Ink-Photos can be produced, without block, from any drawing or photograph, and printed in any tint. The charges are very moderate, and will be quoted on application.
An exceptional opportunity is thus afforded Country and Colonial Firms to introduce their manufactures to the London market. The Compendium will be produced in first-class style, and will doubtless become a standard work of the trade.
Prospectus, with full table of contents, &c., free on application; but Advertisements and Blocks should be forwarded at once to the Advertisement Manager, 16 New Bridge Street, London, E.C.
London: JAMES SEARS & SONS, Printers and Publishers, Crane Court, Fleet Street.

TRADE NOTES.

WE are informed that the encaustic tiles reproduced from the Mediæval examples in our abbey churches by the firm of Messrs. Carter, Johnson & Co., of Worcester, London, and Manchester, have recently been much used in church restoration and building. This firm has just obtained a contract for floor-tiling in the new wing of the Victoria University (Owens College), from Mr. A. Waterhouse, R.A., and has executed work for Mr. A. W. Blomfield, Mr. Norman Shaw, R.A., Mr. J. D. Sedding, and many leading architects in all parts of the country. The pavement in the chancel of the new church of St. Paul's, Worcester, attracted great attention at the consecration services held early in November.

THE Bath stone used for the dressings of the new church of St. Paul's, Worcester, was supplied by the Corsham Bath Stone Co., Limited, of Corsham, from their quarry on the Monk's Park Estate.

MESSRS. EDWIN J. WHITE & SONS, auctioneers, have opened an office opposite the new post-office, at the Hornsey Station, Great Northern Railway, for the purposes of their business. The office has also been furnished as a local pattern and sample room for the Builders' Supply Stores, of Holborn Bars, E.C., for the sale of their materials, appliances, &c. This branch house will prove of great service to the building trade.

THE Coalbrookdale Company, Limited, of London (Victoria Embankment, Blackfriars, E.C.), Shropshire, and Bristol, have just issued an illustrated price list of window frames. The use of iron window frames and casements is now becoming every day more general. The publication of the catalogue is oppor-

IRON DOORS.

TO ARCHITECTS, BUILDERS, AND OTHERS.

An extraordinary number of Iron Doors for Strong Rooms, Party Walls, or such to divide Warehouses.
Quite perfect, and in every respect equal to new, at one-third the price.
GRIFFITHS & SON,
43 Cannon Street, E.C. (only address).

tune. It comprises frames of all sizes, from 1 foot 9 inches by 9 inches up to 12 feet 6 inches by 2 feet 3 inches, for plain, rectangular, rose, and Gothic windows, ornamental lights for stained glass, ventilators with ground glass, fanlights, &c., all these thoroughly suited for square or varied geometric glazing. Attention is also directed to skylights, sky-doors, garden frames, and the like. The illustrated frames number about two hundred, prices being quoted on the average for nearly a score of various sizes for each description of frame. In addition, frames of any size or design are made to order, and special prices are allowed for large quantities.

THE prospectus of the Mortgage Insurance Corporation, Limited, is well worth the attention of large and small capitalists. The Board of Directors is constituted by men of standing, all of whom have had experience in financial work. The prospectus shows a good deal of prudence, and the rates of premiums are sure to attract the public. The list of applications will close on the 15th instant for town and country.

THE penny postage, with which the name of Mr. J. W. Palmer is so intimately connected, is, it is confidently expected, soon to be adopted as an imperial system. The ocean penny postage, according to Mr. Palmer, is no new project, but was before the public in 1840. He says :—"I have in my possession three 'envelopes'—*à la* Mulready—bearing each an appropriate device or sentiment. The first represents a ship upon the ocean, floating an ensign bearing the word 'Peace,' and beneath a black and white hand joined in a fast grip is a motto which suggests that the 'ocean penny postage' will make all Britain's children one fraternity. The second has a symbolical drawing of Britannia receiving the industry of all nations ; and the third represents a British sailor standing on a quay overlooking all the world, in his hand a great flag bearing the legend 'Ocean Penny Postage.'"

BREWERS' EXHIBITION.

MESSRS. LE GRAND & SUTCLIFF exhibited a varied display of their Norton's patent "Abyssinian" tube wells and pumps, artesian well tubes, and Norton's patent registering turnstiles, but the principal feature, which created one of the main attractions of the whole exhibition, was the gigantic artesian boring tools which were actually employed by this firm in boring the two artesian wells—6 feet diameter—for the Southampton Corporation Waterworks at Otterbourne. These are believed to be the largest artesian boring tools ever used. The auger, or miser, for bringing up the *débris* weighed when empty no less than 1½ tons, and, when full, over 3 tons. After the borings were completed, they were lined throughout with perforated steel cylinders, weighing 17 tons for each well.

MESSRS. C. ISLER & CO. also had a good display, and we are informed they have orders from the following breweries for fixing artesian bored tube wells, on their improved system, to obtain pure supplies of water :—Messrs. W. H. Brakspear & Sons, The Brewery, Henley-on-Thames ; Mr. R. Glasson, Union Court Brewery, Penrith ; Mr. H. Goodman, Kingsland Crescent Brewery, Landport ; Messrs. W. S. Pope & Co., Northfleet Brewery, Gravesend ; Messrs. Seabrooke & Sons, brewers, Grays, Essex. Amongst their works lately completed is an artesian bored tube well, 6 inches internal diameter, which is fixed for Messrs. H. & G. Simmonds, of Reading, who have obtained a yield of 10,000 gallons per hour. At Messrs. Grattan's Mineral Water Manufactory, Belfast, a 250 feet tube well, which was fixed through the new red sandstone, gives most gratifying results, both as regards purity and quantity. The upper and surface springs are strongly contaminated with sewage, which has been successfully excluded by means of their improved tube well piping. At West Drayton they have recently completed an overflowing artesian bored tube well, for the Ecclesiastical Commissioners. At the Westminster Chambers, Victoria Street, they have fixed a 370 feet bored tube well, yielding a plentiful supply. This well is the first in London pumped by hydraulic power. They are also fixing wells for the Metropolitan Asylums Board, and for the Corporation of Gravesend at the new Sanatorium.

THE LATE MR. THOMAS M. CARNEGIE.

THE *Pittsburg Commercial Gazette*, in a sketch of "the great ironmaster and millionaire," says :—Over the sea, in Fifeshire, Scotland, in the quiet town of Dunfermline, Thomas M. Carnegie was born forty-two years ago. When but a boy of five, his parents emigrated to this country, and settled in Alleghany City. Here, in the old First Ward School, under the tuition of Professors Kelly and Douthett, he received the early rudiments of mental training. When about sixteen years old he learned the telegraphic alphabet, and soon after was

sufficiently proficient to take a position as telegraph operator under his brother Andrew, who had risen to be the acting superintendent of the Western Division of the Pennsylvania Railroad. He remained in that calling until 1860, when, in company with his brother Andrew, he became a member of Kloman & Phipps, iron manufacturers, in the old Twenty-ninth Street Works. In 1865 the firm purchased the Cyclops Mill, and both concerns were consolidated under the caption of the Union Iron Mills. A large measure of prosperity fell to their lot, and in 1867 they built the Lucy Furnace. In 1873 the firm of Carnegie Brothers & Phipps was organised, and the Edgar Thomson Steel Works—one of the most stupendous steel concerns in the world—was built, and of this company Mr. Carnegie was elected chairman. He was also largely interested in the H. C. Frick Coke Company ; was a director in the New York and Cleveland Gas Company, the Keystone Bridge Works, and many other manufacturing and industrial concerns. His estate is worth nearly 3,000,000 dols. A volume could be written regarding Mr. Carnegie's personal characteristics. He was a man of most extraordinary and exact memory, and was a profound student of metaphysical subjects. It would be hard to find his superior as to Shakespearian and Biblical knowledge. As a student he was thoroughly versed in the various systems of logic, and had the best thought of Mill, Hamilton, and other great thinkers at his fingers' end. He had, with all that has been said, a magnificent judgment and fine reasoning power. Had he not been a great manufacturer, he would have been a great lawyer or writer. His forte was the passing on schemes of magnitude in the business world, and when any profound measure met with his approval it was almost invariably consummated. He was pre-eminently a peacemaker, and always ready to unravel a tangled skein in business affairs, and in these he was quick and keen in his perceptions and perfectly just in his judgment. No man was heard to say an unkind word of Thomas M. Carnegie. Socially he was quiet and unassuming—a man of quiet, of the utmost kindness and the greatest generosity. In all of the business affairs with which he was identified he was looked on as the counsellor and business man, while Andrew was considered in the light of the genius of the family. Thomas M. Carnegie was as straight and honourable a man as ever drew breath. Universally esteemed and loved, he is universally lamented. Mr. Carnegie was wedded to Miss Lucy Coleman, daughter of the late William Coleman, in June 1866. His widow and nine children mourn his loss. His home in the East End was a home in every sense of the word—a picture of domestic happiness that is now obscured by grief. Some years ago Mr. Carnegie purchased 14,000 acres of land at Dungeness, on Cumberland Island, Georgia, and built a beautiful winter residence. The island is noted as the home and last resting-place of heroes of the revolutionary war. Here General Nathaniel Greene spent the declining years of his life, and here "Light Horse Harry" Lee lies buried.

MR. STANLEY G. BIRD.

ON the 8th instant Mr. Stanley G. Bird was entertained at dinner at the Café Royal by his colleagues of the Institute of Builders, the Builders' Accident Insurance (Limited), and the Central Association of Master Builders of London, previous to his departure on a visit to India. Mr. George Burt, J.P., presided. The health of "The Queen" having been loyally responded to, the Chairman said:—In proposing the toast of the evening it was unnecessary for him to make a long speech, but he would just give a short outline of Mr. Bird's connection with the building trade. Previous to 1872 he was connected with the Builders' Society, and in that year took a prominent part in the revival of the Central Association of Master Builders of London upon a permanent basis, and was appointed honorary secretary, which office he filled till the termination of the masons' strike in 1878. When the Employers' Liability Act was passed in 1880, Mr. Bird took a prominent part in the formation of the Builders' Accident Insurance, Limited, of which he was at present chairman ; and he served for four years as President of the National Association of Builders, which society he assisted to form in order to secure united action in trade matters among the various local associations, and he was now Vice-President. In 1884 the incorporation of the Institute of Builders was mainly accomplished through his exertions, and he was now President of the same, as well as Vice-President of the Central Association. He was past President of the Builders' and Builders Clerks' Benevolent Institutions, and had filled the office of Master of the Tylers and Bricklayers' Company, in addition to which he was the colonel of one of the best known of our volunteer regiments. The services Mr. Bird had rendered the building trade would be seen from what he had already stated, and it was with the greatest pleasure he (Mr. Burt) presided that night, when they were all assembled to wish their good friend "God speed," and a safe and pleasant

journey. The toast having been most cordially responded to, Mr. Bird thanked his colleagues for the honour he considered they had conferred on him in entertaining him at dinner previous to his departure.

DRAIN PIPES.

ON Saturday evening the annual address of the chairman of the Association of Public Sanitary Inspectors, Mr. George B. Jerram, A.M.I.C.E., surveyor and inspector, Walthamstow, was delivered at 1 Adam Street, Adelphi. The subject of the address was the best materials and methods of construction of drain pipes, and the most efficient means of making joints impermeable to gas and water.

Mr. Jerram, in the course of his address, said:—It will hardly be necessary to enter into the history of pipe-making, but it is interesting to note that the first patent we have record of was in June 1725, by William Edwards, for a new method, "never yet known or practised for the making of pipes with clay or earth for the conveying of water under ground from place to place," and the first patent on record for socketted pipes was by Samuel Hill in July 1810, and the first patent on record for making socket pipes by machinery was by Charles Jacob in February 1849. It would be quite out of your province to-night, and, in fact, occupy much space beyond the length of this address, if I were to attempt to shortly describe the various patents connected with drain pipes, especially when we find that between the year 1816 and 1885 over 200 have been applied for. The first salt-glazed stoneware pipes were introduced in 1845, and Mr. Edwin Chadwick, our president, was one of the first to suggest the manufacture of pipes of smoother surface than the cement or tile pipes then used. The chief material with which pipes are made is clay, as is well known, and it much depends on the quality of the earth and the manner of its manipulation, on the quality and strength of the pipe. This earth is found in various parts of the kingdom and varies very much in its nature, from the beautiful soft plastic clay found in Dorset and Devonshire and used for making the first and now well-known stoneware pipes of Messrs. Doulton and Messrs. Stiff, and others, to the more open and coarser material of bastard fireclay found in some parts of the midland counties and Yorkshire. And here we may consider the vexed question what is "stoneware?" We know that proper stoneware is clay that is, when burnt, vitreous throughout, of a dense nature, and non-porous, and the greater strength is admitted by many engineers who, in specifying the thickness of pipes to be used, make this difference, that pipes made of stoneware may be 1-12th the diameter, while pipes made of the other material must be 1-10th the diameter in thickness. It must not be thought, however, that pipes that are only made with Dorset and Devonshire clay are stoneware. We all know the beautiful Staffordshire and Leicestershire brown ware, and therefore there is clay to be found in other districts which thoroughly fulfils the conditions of stoneware, and although owing to the proximity of fireclay and other clays, inferior pipes are made in these districts, it is yet possible to obtain pipes of such a nature and material as may fairly be classed as stoneware. Pipes of house drainage are also made of concrete, and stand a very severe test, providing a sufficient time has elapsed between the time of manufacture and the time of using. In my opinion it would be a very useful additional test to specify the weight of the pipes. The standard weight of 9-inch pipes 1-12th thickness of the diameter is thirty pipes to one ton, while many of the lighter pipes that are being made will take thirty-three or thirty-four pipes to weigh a ton. This accounts for the great difference in price between different makers. That pipes should be glazed and as smooth as possible inside is also important, to avoid any obstruction on which sediment may be deposited, in order to facilitate the even flow of the sewage. Here, however, a danger often arises, as a nice looking glaze is not always a proof of a good sound pipe; in fact some of the most porous and friable clays take the best glaze, and some again are easily affected by acids and other chemical substances that are to be found in sewage. We now come to the important question of jointing pipes. What is required is that the pipes shall be perfectly straight, even, and thoroughly water and gas-tight, neither admitting subsoil water nor allowing any chance of sewer-gas from escaping. Many have been the various devices and ingenious ideas for accomplishing this seemingly very easy matter. It is only within the last few years, during which many patents have been taken out, that much attention has been paid to the necessity of making joints both gas and watertight. Mr. Jerram then proceeded to discuss and criticise in detail the various joints which have been introduced by Mr. Stanford, Messrs. Doulton, Mr. Donaldson, Mr. Pritchard, Mr. Mawby, and others, and concluded as follows:—I have thus briefly described some of the different methods used in jointing pipes, but it is no use having a good

Wholesale and Retail Depot:—London, 211 Regent Street, W.

The Celebrated "DUBOIS" Hydraulic Drawn Lead TRAPS and BENDS.

The above Shapes and Sizes always in Stock, and we are prepared to furnish SPECIAL SHAPES to order at short notice. These justly celebrated TRAPS are made from Pure Pig Lead by Hydraulic Machinery after the manner of Lead Pipe, and have peculiar advantages appreciated by every Plumber. They are greatly superior to either Cast or Hand-made Traps, as they have no SEAM, are of UNIFORM THICKNESS. PERFECTLY SMOOTH INSIDE AND OUTSIDE, and can be FLANGED, PLUGGED, and STRETCHED, without fear of SPLITTING, No possibility of Sandholes.

FOR PERFECTION OF MANUFACTURE THESE GOODS ARE PRE-EMINENT.

For Sale generally by the principal Lead Merchants and Wholesale Dealers in Plumbing and Sanitary Appliances throughout Great Britain and Ireland.

DUBOIS MANUFACTURING CO., LONDON AND NEW YORK.

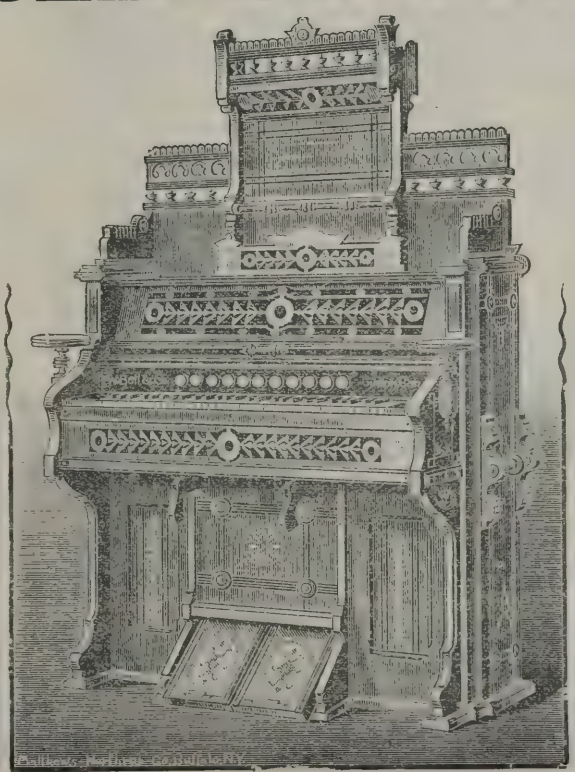
London Office and Works:—15 BRITANNIA STREET KING'S CROSS W.C.

pipe and effective joint unless the drains are laid in a proper manner. For house drains the principal use of the drain is to convey the sewage away from the dwelling as quickly as possible. In many towns, owing to the thick population, the houses are so situated that the drains must pass under the houses; and it is, therefore, most important that great care should be used in laying the drains, so that it would be utterly impossible at any time for sewage gas to escape and permeate the dwelling. The pipes should be laid at a gradient of not less than 1 in 30, thoroughly even, true, and regular, in a perfectly straight line across the narrowest part of the house, all junctions and connexions being placed outside. A manhole or disconnecting chamber should be constructed in front, and the end of the drains at the rear of the house stopped up with a stoneware stopper that could be removed if necessary. This arrangement will facilitate the cleansing or unstopping of the drain should any large foreign substance by any chance get into the pipes without having to take up the floor. In the model by-laws (which are now in force in many districts) for the construction of house drains it is stipulated that the drains should be laid on a solid bed of concrete, and covered with at least six inches of concrete. This is good as far as it goes, but unfortunately there is no definition of how the concrete is to be made, and as any mixture of stones, dust, and lime may be and is, by jerry builders, considered to be concrete, it is to be feared that this preventative may prove to be a failure. To sum up what, in my opinion, are necessary conditions in laying pipes for house drainage. See that the pipes are well made, of dense clay not less than 1-12 or 1-10th the diameter in thickness, and to insure this have the pipes a certain weight, well glazed, true, regular in shape, even in thickness in all parts, the socket to be machine made, not less than 2 inches in depth for any size under 9 and 1-5th the diameter in depth for all sizes beyond, jointed with one of the water-tight joints, and laid perfectly true, and covered in a bed of the best Portland cement concrete, in such a manner as to be easily inspected and cleansed when necessary, and then we shall never need to use cast-iron pipes or hear of any nuisance from defective drains under the houses.

Mr. W. Hearne, inspector, Paddington, suggested that the inspector should, in the first instance, test the degree of water-tightness possessed by drain pipes. The business of the drain layer seemed to belong to no trade in particular. Thus a work which required great knowledge and ingenuity, especially where curves had to be made, was left in the untrained hands of any casual workmen. Mr. Hearne then moved a vote of thanks to the chairman. The vote was duly seconded and supported by the several speakers. In the remarks of subsequent speakers amusing instances were given of what in the country and by jerry builders was considered to be concrete, of which there was no definition which could be enforced in a law court. The importance of thorough efficiency in supervision and the danger run by local authorities in being penurious in providing such supervision over all sanitary work was strongly insisted on. One speaker thought the maker of a defective drain ought to be made criminally responsible. It was also remarked that sanitary inspectors were overworked, too few in number, and had not their duties defined with sufficient accuracy.

Mr. Drake said that he had for some time acted as resident engineer at the Foundling Hospital, where he found that the drains had not been touched for forty years. Sanitary inspectors ought to be examined and formed into a body like the architects and engineers, and thereby acquire a defined professional status. They often risked their lives in their work, and their position ought to be recognised. As things were, all the dignity and honour were claimed by men who could write C.E. after their names, while the hard work fell on the inspectors. It would, of course, be important that the examination should be of a thoroughly practical as well as of a theoretic character.

Mr. Middlewick said that the question of examination and diplomas was being carefully considered by the Council of the Association. On the whole, pipes were good, but the laying of them had in too many cases been carried out in a most inefficient manner.



Mr. Chamberlain said that the London and urban inspectors generally had too much work in the garrets to attend much to the drains. Moreover, the London vestries had not the power of making by-laws which was possessed by rural authorities.

Mr. Legg thought it was absurd to require a certain number of inspections to be made by each inspector without any guarantee of the real character of his work.

The vote of thanks was then unanimously passed, and briefly acknowledged by the chairman, who pointed out that, though additional inspection would at first involve a greater expense, that expense would be far more than recouped by the improved sanitary condition of houses and improved health of the people.

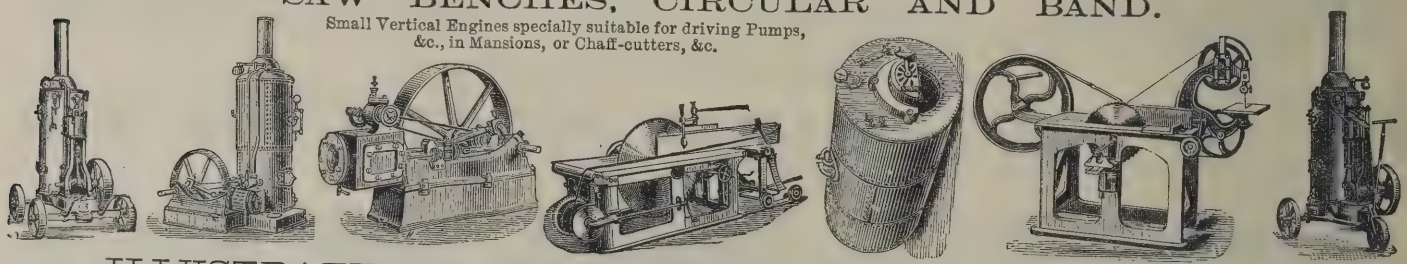
ORNAMENTAL SMITH'S WORK.



LOVERS of the smith's craft, an art which was carried to such perfection in Mediæval days, and the memory of which has come down to us in so many an example, each exquisite in design or quaintly beautiful, cannot do better than pay a visit to the establishment of Messrs. Mappin & Webb in Oxford Street, to look at the large collection of ornamental wrought ironwork that the firm have now on view. The merit of this branch of art metalwork is again meeting with recognition, but this is the first time, we imagine, that those who cater for the public have attempted to keep a stock on hand. It is so suitable for domestic purposes, scarcely anywhere is it out of place. It would be hard to find a material or surrounding decorations with which it would not harmonise. The merits of ornamental brasswork need no commenting on, and it will always hold its own for ecclesiastical furniture, but often in domestic buildings its presence or absence is scarcely noticeable enough among the general decorations of our interiors, including pictures and their frames, vases, knicknacks of all kinds, as well as the permanent ornament, in all which an effect of brightness is the effect generally aimed at to counteract the dulness of our skies. This large collection at Messrs. Mappin & Webb's comprises examples of wrought ironwork from Milan, Venice, Munich, Switzerland, Austria, Hungary, and Germany, as well as the numerous examples of English work by the firm. Nearly every conceivable purpose for which the material can be used seems to have been thought of and realised in metal. Among them are pendant hall-lights, one with a handsome Bohemian glass dish, hanging baskets for gas with stained glass, dining-room chandeliers of elaborate workmanship, arranged with lamp in centre, and also furnished with branches to hold candles, which can be lowered and run up again like the ordinary gaselier. Others, again, have the duplex burner lamp. Indeed, any lighting agent, from the common candle to electricity can be used, and we notice one bracket for electric light particularly well designed. A gigantic pair of candelabra, elaborately enriched, had a design mainly floral; a pedestal candelabrum was designed to occupy a corner position, and supported three branches for candles. A large number of fine entrance and other hanging lamps, varied in design and description, some pendant from brackets, suitable for most requirements, or also in forms for supplementary uses such as the conservatory, the summer-house, &c.; also a variety of fireplace fittings, grates, fire-dogs, fire-irons. One set of these fittings is shown in a remarkable work, forming a handsome chimney corner after the old work, of solid carved oak with seats on each side. Chaucer's "Canterbury Tales" are the subject of the carving on the panels of the frieze, the subsidiary panels showing carved Renaissance work. The roof is panelled, and filled in with stamped leather. The metalwork includes both the black and bright metal. In the latter is a peculiarly handsome table, with plush top, well worth attention; flower stands, one with flower bowl of Bohemian ware, crowned with a tasty frill of wrought ironwork, pendants for flowers, and delicate little flower hand-baskets with glass cups; a handsome mirror, well set off in frame-work of metalwork. But the objects on a large scale are too numerous to go more into detail about, and the same may be said of the smaller-sized articles. Among these latter are a great variety of prettily or quaintly-designed table furniture, inkstands, paper weights, table candlesticks, hand candlesticks, card trays, rose sprays, hand lamps for oil, &c. The old-fashioned Martin Luther candlestick, and a handsome card tray with St. George and the Dragon quaintly executed, must not be overlooked; and attention should be called to the pretty portable lamps for outdoor work, designed as miniature Swiss châlets. The idea of the firm in bringing these objects before the attention of architects and the public in general is an enterprising one, and should meet with the success it deserves.

PROPOSED RESTORATION OF ST. MARY MAGDALEN CHURCH.

AN adjourned joint vestry for the united parishes of St. Mary Magdalen and St. Gregory by St. Paul was held on Thursday, in last week, in the vestry-room of St. Mary Magdalen Church, Old Fish Street. The object of the meeting was to consider a specification of the repairs necessary to the interior of the church, and the *City Press* gives the following report of the proceedings:—

The Vestry Clerk read a report sent in by Messrs. W. Hudson, Son & Booth, architects, 19 Benet's Hill, which set forth that the exterior of the square part of the tower, up to the level of the principal cornice, is in fair condition, the stones and joints, with some few exceptions, being in a reasonable state of preservation. The lower portion of the tower, however, ha s

COLES, STEWART & CO.,
STOCK AND SHARE BROKERS.

Messrs. COLES, STEWART & CO. undertake every description of Stock Exchange business, and have special and early information on all leading Stocks; they are also continually advised by telegram from the chief Mining centres, both at home and abroad. For Investment Messrs. C., S. & Co. make only one charge of $\frac{1}{16}$ per cent. commission on all descriptions of Stocks, and open Speculative accounts with from 1 per cent. cover and upwards, without any further risk or liability to their clients whatever.

THUS, £5 commands £500 Stock; £10, £1,000 Stock; £50, £5,000 Stock;
And so on to any amount.

In the transaction of speculative business Messrs. C., S. & Co. make no charge for commission or brokerage whatever unless their client makes a profit, when they take 5 per cent. of the profit made as their remuneration.

All transactions advised by wire as soon as completed. Monthly Circulars and Mining Reports post-free on application.

COLES, STEWART & CO., St. Stephen's Chambers, LONDON, E.C.

at some period been rendered with Roman cement, which requires some repair. The principal cornice of the square tower appears considerably weather-worn on the surface, but, considering the length of time it has been subject to the effects of the elements, not more than might be expected. Beyond some slight indications of some portions of the coarse moulding having burst off, the stone is in a fair state of preservation. The architects consider (without further examination, to be obtained only by an efficient scaffold being erected) that a thorough repair by filling in the joints, and bedding in with Portland cement is all that is required, so far as regards the principal cornice. An inspection of the portion of stone cornice of the cupola, which fell on the roof of Messrs. Borass & Co.'s premises in Old Change, in September last, suggested that this stone might have been originally defective at the time of building, over two hundred years ago, and that the weather has gradually acted upon the stone so as to eat it nearly through (within three-quarters of an inch), and its fall was inevitable sooner or later. It is, however, not to be supposed because this particular stone has fallen, that the whole of the upper cornice is in like condition, but rather that this is an exceptional case. The stone steps of the winding staircase of the tower leading up from the ground floor of the church to the first stage above the gutter of the main building, or where the large bell is hung, are worn away to some extent, not only the treads, but the segmental ends forming the central newel. There is, perhaps, no immediate necessity for repairs here. The roof of the church, which is covered with cast lead, is generally in fair condition, together with the gutters thereof. The parapets of the north and west fronts require superficial repairs by pointing both inside and out, the joints being perished to the extent of 3 inches deep in some places. The stone facings of the west front, next the skylight of Nos. 51 and 53 Knightrider Street, require repair. Approximately, the cost of the necessary works, including the raising of a scaffold round the octagonal cupola, will not exceed 150*l*.

Mr. Foyle said all that was desired was to effect such repairs as would secure the safety of the fabric and the surrounding property. He believed that St. Mary Magdalen had some funds in hand.

Mr. Booth said the works mentioned in the report were absolutely necessary for the safety of the building.

Mr. Adamson said last Sunday morning he saw a portion of the stone of the church, about four pounds in weight, that had fallen on to the street. If it had fallen on a man's head it must have killed him.

Mr. Foyle said they must not lose sight of the fact that in a few years this church might be used for other purposes. In all probability, in a few years many of the City churches would be turned into warehouses. This should be borne in mind when spending the money of the ratepayers.

Mr. Adamson was of opinion that the whole of the work should be proceeded with without delay, before the bad weather set in.

After a conversation it was decided that the financial portion of the subject should be discussed in the respective vestries of St. Mary Magdalen and St. Gregory, each parish having control of its own funds.

It was decided that the following firms be invited to tender for the work, viz. :—Messrs. R. C. Cutting & Co., Wardrobe Chambers; Mr. W. B. Lawrence, Knightrider Street; Messrs. Bevan & Dallman, Sermon Lane; and Mr. Mixon, Godliman Street.

The vestry was then adjourned for a fortnight, when, it was stated, the tenders will be opened.

BRYANT, POWIS & BRYANT, LIMITED.

A GENERAL meeting of the shareholders in Bryant, Powis & Bryant, Limited, was held last week at the City Terminus Hotel. Mr. Wilberforce Bryant presided. He said it was not the practice of companies to call their shareholders together to declare an interim dividend, but to send a cheque through the post. The directors, however, thought that the shareholders would like to meet the board and hear from them a little as to how the business was going on. He was glad to inform them that in spite of the depression, their business had increased in the last six months, and notwithstanding the fact that they had exercised greater caution with respect to credits. The sum put aside last year to meet any possible bad debts had not been fully required, though all the amounts had run off. It seemed to be the general impression that the period of depression was passing away, and that a substantial improvement might be looked for at the opening of the new year. They confidently believed that when the books were made up to the end of March next—the close of their financial year—a balance would be shown which would enable them to pay a good dividend and to add a good sum to the reserve. Last year they carried forward

Will burn any kind of Coal or Rubbish, consume their own Smoke, and require only one-fifth the Fuel of any other Store.

After four years of tedious experiments I have been able to produce what has long been required, viz., Domestic Stoves which consume only one-fifth the quantity of Coal (*One Ton instead of Five*) required by any ordinary stove, at the same time giving a great an amount of heat and more thorough ventilation. I have great confidence in recommending these to the public. Since perfecting them I have tried them for six months in the worst of smoky chimneys, and they have not failed in any one case; have shown them at work to a large number of scientific, medical, and practical men, and they have given but one opinion, which is that, as regards heat, health, and comfort, they are perfection, and they have not seen or heard of anything to equal them. The fire-grate is perfectly open, like the register or slow-combustion stoves now in use; they are neat, strong, and easy to understand; will burn any kind of coal or rubbish; **consume their own smoke**; are lighted just in the same way as an ordinary stove, and draw up as quickly and as easily.

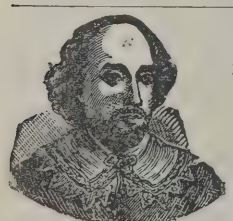
some thousands to the credit of this year's business, and they said they thought it probable that a portion of the amount would be invested to form a nucleus of a reserve fund. With that object they had invested 5,000*l.* in Consols. He concluded by proposing a resolution authorising the directors to distribute "out of estimated profits" an interim dividend for the half-year ended September 30 last, at the rate of 15 per cent. per annum. Mr. Pugh (a shareholder) seconded the motion. In reply to questions, the Chairman said that the dividend would be paid less income tax. The question of a Stock Exchange quotation had been engaging their attention, but the matter had been deferred on a technical objection by the Stock Exchange Committee. Mr. Wotton took his goodwill in shares instead of money, and that fact was construed by the committee into that gentleman being the vendor, and that more shares had thus been taken by them that the Stock Exchange would permit. The motion was carried unanimously.

ENCROACHMENTS OF THE SEA.



A MEETING of the Geologists' Association was held at University College on the 5th inst., when Mr. Topley, the president, read a paper on "The Erosion of the Coasts of England and Wales." Mr. Topley, who is secretary of the British Association Committee which is investigating this subject, stated that the greatest encroachments took place along the coasts of Holderness and Norfolk, where the sea gains on the land at the average rate of from two to three yards per year; but, locally, and during exceptional gales, the rate is much higher. On January 30, 1877, parts of Norfolk lost an average of three yards for several miles, and near Bacton the loss was fifteen yards. On the south and west coasts, Folkestone, Brighton, Worthing, Bournemouth, Westward Ho! and Pembrokeshire were amongst the places mentioned as typical instances of the constant scouring action of the sea. It has been shown conclusively that shingle beaches, the natural protectors of the coast, are driven eastwards on the south coast and southwards on the east coast, their direction being wholly due not to tides, but to the prevailing winds. The effect of groynes is to collect the shingle and to protect the immediate locality, but generally at the expense of places further east or south. Worthing, Mr. Topley observed, is heavily groyned, and the shingle there accumulates, but east of the town the coast is rapidly receding. Folkestone pier is a large groyne, which has collected a considerable area of shingle on its west side, while Copt Point and Eastwear Bay, once protected by a continuous band of shingle, are now nearly bare and the coast is rapidly receding. In the case of Brighton, the groyning to the west caused extra scouring to the east, and the old raised beach was being undermined. It was pointed out, also, that the erosion of the sea-bottom in front of the beach was steadily deepening the sea, and this increased the effect of heavy storms. The lecturer strongly denounced the removal of shingle for road metal, ballast, and other purposes, a practice which was in many places doing vast mischief. Notwithstanding the encroachments of the sea in some directions, it is computed that the surface of England is at least as great as it was 500 years ago, the reclamation of land in some places equalling the waste in others. In the Wash alone, within historic times, an area of 100 square miles had thus been gained from the sea.

NOTES ON NOVELTIES.

"Gransorbian."—A new method of graining has been patented by Mr. George Brighouse, of 40 Irvine Street, Liverpool, who is the sole manufacturer and proprietor. The employment of this new process has been taken up in the trade already to a very large extent, but there is not a doubt that its use will become universal, for wherever it is known it is approved, by reason of the saving of time, and consequently saving in cost, it effects. By means of the "Gransorbian" large spaces can be grained in a space of time that appears incredible to all who have not seen the ready way in which the work is accomplished. A description of this new process—the "Gransorbian"—has been given by a writer who has had long experience in decoration, and what he writes agrees with our own views after a personal examination of the process:—"The 'Gransorbian' is made in continuous rolls, 2 feet wide, and presents the appearance of a wooden block cut for printing purposes. Suppose it is a piece of oak. We are looking at the portions that would, in the ordinary way of graining, appear light, as the figure or dapple and the combing. This appears on the 'Gransorbian' paper in relief, and is white in colour and spongy in texture, and it is this portion that produces the graining effect. In the case of each wood the pattern is made 6 feet long without a repeat, in this respect giving a distinct advantage over any other mechanical process. The paper is prepared for the following woods:—Oak (three

kinds), oak sap, pollard oak, pitch pine (two kinds), walnut' mahogany, Hungarian ash, English ash, and maple, so that the decorator has a range of some eleven woods to work upon, and the imitation of the respective woods is excellent, and will satisfy the most fastidious grainer. It is a strong recommendation of 'Gransorbian' that it is available for either oil or distemper graining, and with equal advantage and facility of manipulation. This is a distinct advantage, inasmuch as it allows the decorator to deal with any job demanding urgency in a satisfactory manner. Assuming that we have a range of doors to grain in oak, we work as follows :—First, we cut four pieces out of the paper to the size of our door-panels, and another piece for the lock-rail ; having mixed our graining colour of half oil and half turps with the other ingredients in the usual proportion, we proceed and rub in the door. Now comb the stiles in the usual way, getting as much variety in the combing as possible ; the top and bottom cross-rails we may simply streak across with the stippler or rubbing-in brush, and the lock-rail we may do in the same manner or leave it plain. We now take the 'Gransorbian' for the top panel and lay it against the panel directly, and without any indecision, as the absorbent properties of the paper are so great that wherever it touches it lifts the colour, and it is, therefore, a necessity that it should touch only the place where it is wanted. Having placed it on the panel, we take the small roller and roll it well over the back of the paper. This is to insure that the grain is pressed equally over every part of the surface, and in doing this it is very important indeed that the paper is not shifted, and to this end it is better that two are employed, one to hold the paper and another to roll. The whole thing is done in a much shorter time than it has taken us to pen this description. We now take the second, third, and fourth panels, and treat them in the same way, whilst for the lock-rail we use a piece of the sap, and for the top and bottom stiles a piece of figured wood, and the whole door is complete." As to the finished work, it cannot fail to be pleasing if proper judgment has been used. Overloading the design with figured work is just as distasteful, if not more so, than the opposite fault of weak or attenuated design. For church work, public halls, railway stations, or any other large works, it would make all the difference between profit and loss. A church at Wavertree, Liverpool, was done by this process inside in about the same length of time as the grainer occupied in graining the outside doors of the church ; and a church at Colne was recently grained throughout at a cost in material of *7s. 6d.*

Sewer Ventilation.—The illustrations show the application of the well-known Æolus Waterspray ventilator to sewer ventilation, whereby the direction of the currents, whether upcast or downcast, are compelled to travel in the direction desired. It is a well-established fact that automatic systems, however well contrived theoretically, do not in practice effect this result, but frequently reverse themselves, the inlet shaft becoming the up-take and the outlet shaft the down-take. The unpleasant, not to say dangerous, results of this aberration can be readily conceived. Fig. 1 shows the downcast ventilator with the ordinary wind-catcher head in the shaft, below which is set the spray, which drives the fresh air down into the sewer. Fig. 2 is the upcast ventilator, in the suction limb of which another spray is fixed exhausting the gas from the sewer, and driving it up the upcast shaft, which may be carried to any

BUILDERS' BENEVOLENT INSTITUTION.

THE thirty-ninth anniversary dinner in aid of the funds of this Institution took place on the 4th inst. at Carpenters' Hall, London Wall. The President, Mr. Basil E. Peto, occupied the chair, supported by Mr. E. l'Anson, President of the Royal Institute of British Architects, Mr. H. J. Kennard, Master of the Carpenters' Company, Sir Morton Peto, Bart., Alderman W. Lawrence, Mr. George Plucknett, J.P., Messrs. F. J. Dove, T. F. Rider, Banister Fletcher, H. Colls, &c., &c.

The loyal and patriotic toasts were given from the chair, Major Brutton responding for the Army and Navy, and Major J. T. Bolding for the Reserve Forces.

The President, in giving the toast of the evening, "Success to the Builders' Benevolent Institution," referred to the ever increasing keenness of competition, which had unfortunately undermined the good old fellowship which existed in trade by isolating them one from another. Such an opportunity of meeting and uniting for the good of even a portion of the trade, must therefore be hailed with feelings of satisfaction. In the end the business of most of them would seem but an unsatisfactory, unsocial, and even selfish affair, and were it not for such opportunities as the present, some of their greatest successes might perhaps turn out to be mere Pyrrhic victories after all. Men who had set out at the commencement with no greater ambition than honestly to support themselves, their wives and families, were as a rule those helped by the Institution, and who in the approach of old age, in many cases, found their business gradually slipping from them, and going to more successful competitors. In this spirit the Institution was able to help such persons, and to show that they still had the kindly sympathy of those connected with the trade. During the year the charity had lost a munificent supporter by the death of Lord Penrhyn, and there had also been several defections of old subscribers. The powers of usefulness of the Institution depended entirely on the maintenance of its annual income, and he felt that he would not appeal in vain to them to fill up the gap that had been made in the subscription list.

The President also proposed "The health of the Carpenters' Company," thanking them for the use of their fine hall.

Mr. Kennard, the master, in replying, expressed the satisfaction felt by the Carpenters' Company in granting the use of the hall. When the Company was formed the carpenters were really the London builders, though bricks and mortar had long taken the place of wood in the construction of buildings. The old rivalry between the builders and carpenters had long ceased, and he hoped for many years they would be the guests of the Carpenters' Company on these festive and charitable occasions. Mr. Kennard also gave "The Chairman and President," who, in responding, expressed his satisfaction at being able to do something for the Institution.

Mr. Banister Fletcher next proposed "The Vice-Presidents and Trustees," coupling the toast with the name of Sir Morton Peto, who had ably filled the chair thirty-three years ago.

Sir Morton Peto replied, and spoke at some length upon the great changes in the building trade. In his day, when a few firms only were invited to compete for a large work, they used to imagine things were difficult, though nowadays it must be much harder. Their business there that evening should, therefore, be to aid those of their brethren who had not marched with the times, but had fallen by the wayside.

Alderman W. Lawrence proposed "The Treasurer" (Mr. George Plucknett, J.P.), whose presence reminded him of the days when the Lucases, Cubitts, and others used to meet and complain of the severeness of the struggle.

Mr. Plucknett, in replying, referred to the satisfactory progress of the Institution, the increased number of its pensioners, and the augmentation of their stipends. He also expressed a hope that many of the new firms established in London would become subscribers to the charity.

Mr. T. F. Rider gave "The Architects and Surveyors." The first were a body of intelligent and worthy gentlemen, whom it was a pleasure to be connected with in business. The surveyors, who performed a more prosaic work, acted as buffers between the architect and the builder.

Mr. E. l'Anson, who replied for the architects, said that no work required so much organisation, such mastery of detail and control over financial matters, as that of the builder. He believed he might truly say for the great body of his profession that in all their dealings they endeavoured to do what was just and true for the builders, as well as right for their clients.

Mr. A. J. Hunt also replied for the surveyors.

The concluding toast was "The Committee and Stewards," proposed by Mr. E. Woodthorpe, and responded to by Messrs. T. G. Smith and J. W. Hobbs. Subscriptions and donations amounting to 678*l.* were announced during the evening.

BRADSHAW'S LIMMER ASPHALTE

Messrs. BRADSHAW & CO., being Sole Agents in the United Kingdom for, and possessing proprietary rights in, the Freehold Mines of the German Asphalte Company (of which Mr. C. W. Bradshaw is also a Director), situated at Limmer, near Hanover, and Vorwohle, Brunswick, possess special facilities for reliable and prompt delivery of their celebrated "LIMMER ASPHALTE" at low rates, either for sale in its natural state or ready for laying by their own workmen in any part of the United Kingdom. EACH BLOCK supplied from these Mines, besides bearing the impress of the Company, is stamped with the words "BRADSHAW & CO." The attention of Architects, Engineers, &c., is particularly called to the fact that the "LIMMER ASPHALTE" is especially suitable for use in the construction of Reservoirs, Roofs, &c., where water-tightness is extremely essential. For such purposes **Over 2,000,000 (Two Millions) of Square Feet of "Limmer Asphalte"** have been executed by Messrs. BRADSHAW & CO.; while for Paving purposes **Over 50 Miles of "Limmer Asphalte" Footways** have been laid by them in the LONDON DISTRICT ALONE. Messrs. BRADSHAW & CO. will be happy to forward Prices, Samples, and Testimonials, and give all information on application to:—

R. ADAMS,

17 BLACKMAN STREET & 7 GREAT DOVER STREET, LONDON, S.E.,

INVENTOR and PATENTEE of the

SAFETY WINDOW WITH REVERSIBLE SASHES

FOR INEXPENSIVE AND PERPETUAL CLEANLINESS,

Which has gained at the INTERNATIONAL HEALTH and SANITARY EXHIBITIONS

Two Gold, Four Silver, and Four Bronze Medals, and Sixteen Diplomas of Merit.

IMPORTANT NOTICE.

The Patentee has been advised by several of his friends to form a Company for the Manufacture of the above-mentioned Sashes in larger numbers, for the supply of the Trade and for the Home, Colonial, and Foreign Markets. Hitherto he has only supplied the Fittings, except under very special circumstances. He now proposes to manufacture the Sashes complete with Fittings.

Provisional Protection has just been granted for another Patent, whereby the Sashes will be greatly reduced in price, and, consequently, brought within the requirements of every Architect and Builder.

If any of the readers of this journal wish to receive further particulars or to take Shares in the proposed Company, they are requested to make early application to the Patentee, as it is expected that the larger number of the Shares will be privately subscribed.

Applications for Shares will be taken in the order in which they are received.

LOFTS' PATENT STOVES

Will burn any kind of Coal or Rubbish, consume their own Smoke, and require only one-fifth the Fuel of any other Stove.

After four years of tedious experiments I have been able to produce what has long been required, viz, Domestic Stoves which consume only one-fifth the quantity of Coal (*One Ton instead of Five*) required by any ordinary stove, at the same time giving as great an amount of heat and more thorough ventilation. I have great confidence in recommending these to the public. Since perfecting them I have tried them for six months in the worst of smoky chimneys, and they have not failed in any one case; have shown them at work to a large number of scientific, medical, and practical men, and they have given but one opinion, which is that, as regards heat, health, and comfort, they are perfection, and they have not seen or heard of anything to equal them. The fire-grate is perfectly open, like the register or slow-combustion stoves now in use; they are neat, strong, and easy to understand; will burn any kind of coal or rubbish; consume their own smoke; are lighted just in the same way as an ordinary stove, and draw up as quickly and as easily.

Full particulars on application.

To be seen in action at London Show-rooms, 165 Queen Victoria St., E.C., or at Cambridge.

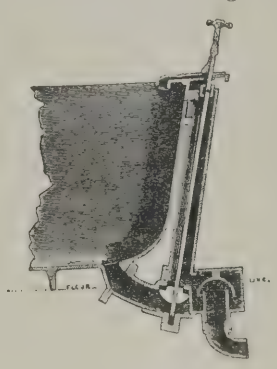
GRUNDY'S PATENT WARM-AIR VENTILATING FIRE GRATE.
The novelty, superiority, and advantage of this patent consist in the heating surface being greater than any other Fire-grate introduced to the public. It is very simple in construction, and is made in the form of a Stove, the back of which is semicircular in shape, with gills behind and smoke-nozzle on top, all cast in one piece. The same can be attached to any design of a Register or Stove front. It is very suitable for schools, class-rooms, waiting-rooms, hospitals, offices, dormitories, and dwelling-houses, from the cottage to the mansion. Design and specification post free on application.
TESTIMONIALS.
"9 Victoria Chambers, Westminster, S.W.: June 10, 1884.
"SIR,—I have much pleasure in testifying to the efficiency of your patent warm-air fire grate. It has been very successful, and given every satisfaction where I have used it. Yours, &c.,
"To Mr. Grundy. JAMES WEIR, F.R.I.B.A."
"6 John Street, Bedford Row, W.C.:
"December 16, 1885.
"DEAR SIR,—I have now had an opportunity of testing your patent grate, and am glad to be able to say that I am most agreeably disappointed, because, as you are aware, I was rather sceptical about its powers when you showed it to me; but now I can say it answers admirably, and heats abundantly my porch-conservatory.—I am, yours truly,
"R. S. LANDER, F.R.I.B.A.
"To Mr. John Grundy."
From James Garry, Esq., Architect, West Hartlepool, July 1884.
"DEAR SIR,—I have very great pleasure in stating that the first stove, or patent warm-air ventilating fire grate, adopted by me in school at Seaton, and a second in a Cocoa Palace, have given such satisfaction that I now order eleven to be inserted in New Upper Grade Schools in course of erection at West Hartlepool. They are the most economical, efficient, and easily managed stove at present before the public.—Mr. John Grundy."
From Hon. and Rev. G. G. C. Talbot, M.A., Withington, Cheltenham.
"DEAR SIR,—You will be gratified to hear that the school is completely warmed by your new grate. It is the most economical and efficient that I have ever seen.—Mr. John Grundy."
Society of Architects, Architectural and Building Trades Exhibition, 1885:—"5 Great James Street, Bedford Row, May 1.—The warm-air ventilating grate shown by Mr. John Grundy at Stand 75 Floral Hall, is an admirable contrivance for utilising the heat conducted through the back and sides of the stove, for warming schools and buildings by a supply of freshly warmed external air."
Apply to JOHN GRUNDY, 30 Duncan Terrace, City Road, London.—Works: TYLDESLEY, near Manchester.
Agent for Scotland, SEPTIMUS HARPUR SMITH, 1 Upper Gilmo Place, Edinburgh.

MESSRS. C. ISLER & CO., of Southwark Street, London, have received orders for fixing their improved patent registering turnstiles at the National Agricultural Hall, Kensington. At the Liverpool Exhibition these turnstiles were awarded the silver medal.

A COMMERCIAL museum has been established in Maçon by the French Government. There are now at least fifteen museums of the kind in France.

THE Italians have set up a Chamber of Commerce in Paris, and attached to it is a pattern-room for the exhibition of samples of Italian goods likely to suit the requirements of French consumers. Samples of articles of French produce and manufacture in demand in Italy will also be received for exhibition. How long will it be before a similar institution is formed to aid in the extension of English trade in France?



THE new stained-glass window was unveiled, and a special service held, in Oakley Church, Scole, Norfolk, on Tuesday, Nov. 16. The window is a memorial to the late Sir E. C. Kerrison, Bart., designed and executed by Messrs. Heaton, Butler & Bayne, of Garrick Street, London. In the four lights are subjects representing the "Birth of Christ," "The Crucifixion," and "The Angels with the Maries at the Tomb." The figure work is placed under canopies in the Perpendicular style, and the colouring is very refined and harmonious. The coat-of-arms of the deceased baronet is introduced into the window, with an inscription which reads as follows:—"In memory of Edward Clarence Kerrison, Bart., born January 2, 1821, died July 12, 1886. This window is erected by his sorrowing friends and parishioners of Brome and Oakley."

HIS Royal Highness Prince Henry of Battenberg has graciously acceded to the request of Mr. W. Busbridge to present to the students of the Metropolitan Drawing Classes the Queen's Prizes awarded by the Science and Art Department. The ceremony will be held in the Guildhall on Wednesday evening, December 1, at 8 o'clock, under the presidency of the Right Hon. the Lord Mayor, who will probably be supported by the Sheriffs, the Bishop of London, Sir P. Magnus, John McGregor (Rob Roy), and other members of the local science committees. The prizes have been gained chiefly by working men engaged in the building and engineering trades. About 800 artizans, after the labours of the day, attended these classes for study and self-improvement, in order to become more efficient workmen. The work of the present session has already commenced in twenty-eight centres.

THE prospectus of the Consumers' Economic Water Softening and Purifying Company, Limited, merits attention from our readers. In the first place, as a sub-company, it at once starts with a valuable connection. Southampton has adopted the system, as well as places in Kent and Surrey. The Atkins process, which is to be purchased by the Company, has been amply tested, and the patentee claims that it is practically without a rival. When it is remembered that the softening and purifying of water are becoming more essential every day, it is not unreasonable to calculate that a million or more will be expended on the Atkins system in a few years, and on that outlay there ought to be a dividend to satisfy the most exigent investor.

NOTES ON NOVELTIES.

The Wheathill Bath.—The Wheathill Foundry Company, Limited, of Rotherham, has recently patented the Wheathill Bath Discharge Valve Handle, which is a great improvement on the present system. Instead of the old awkward arrangement, the valve handle has simply to be lifted and slightly turned to close the valve when filling the bath, and the valve handle

allowed to drop to empty it. The system is practically automatic and does not require any attention when in action. We append illustrations, which will at once make the value of this improvement clear. The waste pipe is securely trapped, and both this trap, as also the discharge valve, can readily be got at and cleaned, without removing the floor boards, an

advantage which, we believe, is peculiar to this bath. The fittings include hot and cold screwed-down valve taps, and drained soap dishes, and as all the fittings are sent out attached, nothing more is required in fixing than to make the hot and cold water and waste-pipe connections. The hot and cold water supply are delivered at the edge of the bath, and thus these are available for other than bath purposes. We can cordially recommend this patent to our readers as an improvement which has long been required, which effects a noiseless and rapid discharge, and is of sanitary importance, while the fitting is easy and convenient.

THE MERTON SMITH MEMORIAL CROSS.

A VERY handsome memorial of the late Rev. Merton Smith has just been erected in Plympton St. Mary churchyard. The cross is of grey Dartmoor granite, and is built on the model of the ancient churchyard crosses of which several examples are still remaining in the western counties. Its entire height from the ground is 22 feet 2 inches, of which the central shaft is a monolith 9 feet long, and the width of the arms of the cross is 4 feet 6 inches. The whole of this portion, including the cusped circle surrounding it, is also cut out of the solid, and some idea of the magnitude of the entire structure will be gathered from the fact that this one stone alone, before being cut, weighed 30 cwts. The base rests on six octagonal steps, round the uppermost of which is carved the following legend in Latin :—"The day is at hand. The Lord grant that he may find mercy of the Lord in that day." Above this the base rises for about 4 feet, having on alternate sides traceried panels and shields in relief. The shields bear sacred emblems, as follow :—On the first, the Cross; the second, the monogram of our Lord, "I.H.S."; the third, the fleur-de-lys of St. Mary, to whom the church is dedicated; and the fourth, the priestly symbol of the chalice and bread, in reference to the sacred calling of the deceased. The memorial inscription occupies the eastern panel, and, in letters of lead, reads thus :—"This cross was erected by many parishioners and friends to the glory of God and in memory of Merton Smith, M.A., some time vicar of this parish, who lost his life August 8, 1883, in the Pyrenees, near to Eaux Chaudes, by falling from a precipice. His remains lay undiscovered for eighteen months, when they were found and committed to the grave at Eaux Bonnes, April 27, 1885." Around the cornice of the base and at the cap of the shaft is carved conventional foliage in accordance with the style of the cross—late fourteenth-century Gothic. The work has been admirably carried out by Messrs. J. & E. Goad, of the Phœnix Steam Marble Works, Millbay Road, Plymouth, from drawings by the Rev. Ernest Geldart, rector of Little Braxted, Essex. Amongst many memorials now in hand at Messrs. Goad's is an excellent specimen of one of the old Cornish crosses, and made of granite from that county. The height of the cross from the ground is 9 feet, with a granite curb of the same material standing on a Yorkshire stone slab enclosing a space of 9 feet by 4 feet. This cross is being erected to the memory of the late Mrs. John Inglis, of Kensington, and will be fixed by Messrs. Goad in Highgate Cemetery, London. It is from drawings by Messrs. G. M. Silley and A. G. Langdon, architects, of 17 Craven Street, Strand, London.

ARBITRATION BETWEEN EMPLOYERS AND WORKMEN IN FRANCE.

M. LOCKROY has drafted a *projet de loi* on arbitration between employers and workmen. After giving a sketch of the law on this matter, and after reviewing the statutes respecting it in England, Germany, Norway, and the United States, M. Lockroy lays down that arbitration should be made easy and accessible to employers and workmen without being compulsory. He therefore proposes that arbitration should be legal at the very moment of disagreement, and without expense to either side. It will be sufficient that one of the parties should ask for an arbitration. The law will tell him to apply to the Mayor of his Arrondissement, who will communicate within forty-eight hours with the party on the other side. Should the latter refuse the arbitration, his reasons must be given in writing. The refusal is conveyed to the original applicant in the form of a declaration signed by the Mayor to that effect. Should the arbitration be accepted, each side appoints an umpire, and both jointly select a referee to decide finally in case of their disagreement.

In England, M. Lockroy says, the parties to an arbitration are bound to show their books. This would not be compulsory under the new French law, but all establishments that are not afraid of examination would doubtless show their accounts if required, and a refusal to present them might guide the judgment of the umpires. The verdict of the latter is to be final and public.

THE SWEDISH TIMBER TRADE.

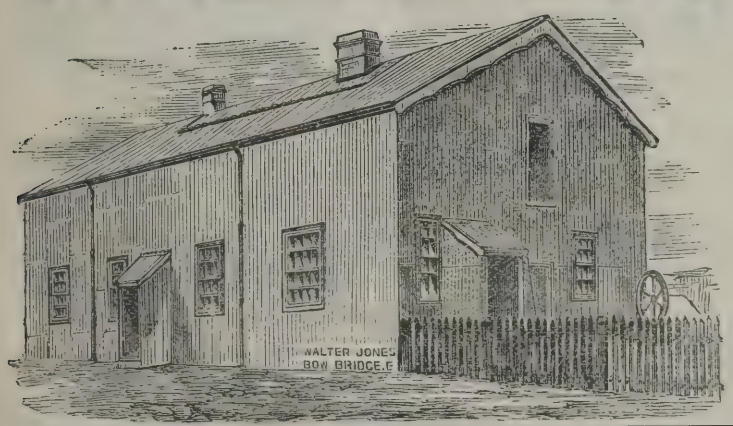
THE following extract from an article published this month in the *Swedish Timber Journal* will be read with interest by those engaged in the timber trade with Sweden :—

During the latter months the prospects of the timber trade have been very dismal, and those clouds which did not exist have been imagined by many people in order to aggravate the situation and hasten the acceptance of losing prices by exporters. The latter have nevertheless not joined in the agitation, either by selling off or by consigning their goods, but have prudently held back, awaiting more favourable opportunities. This has given rise to an unfortunate state of affairs, as it is now reported from England and France that the stores lying in Swedish ports are so large that a rise in prices cannot possibly come to pass. That this is not the case, exporters ought to be able to decide for themselves better than the foreign agents, and from what we can gather, there is no danger on that account, as either the stores in Sweden are not larger than usual, or it is a well-known fact that the stores of timber in the importing countries, especially in England and France, are very small.

It is true that the depressed state of commerce has wrought its effect upon the timber trade, but in comparison to other articles, wood goods have held their prices very fairly, and those falls which have occurred at the close of the summer seasons could surely have been prevented if exporters had not allowed themselves to be intimidated by evil forebodings.

Already last winter it was known that the stores in England and France were small, and with the limited export which took place this shipping season, the prices ought to have been held up. In short, we have shown in every number of our journal this year that the exportation has lessened month by month, and yet many considered us sanguine.

It appears, however, now, that this was not the case, as there are indisputable signs of an early improvement in the timber trade, which should also be favourably affected by the progressive movement which is commencing to force itself into the old world from America.



We have lately heard of several speculations which can only be regarded as a commencement of what is to come. That the improvement which we now foretell will come, together with the speculations, we do not consider likely, and we therefore recommend great prudence in accepting offers, as it is only thereby that any improvement can be strengthened.

The freight market continues steady, with a tendency to rise. The latest quotations which have come to our knowledge are Hernösand to London, 28*s.* to 28*s.* 6*d.*; Gefle to London, 26*s.* to 26*s.* 6*d.*; Sundsvall to Grimsby, 30*s.*

MANCHESTER TECHNICAL SCHOOL.

THE following is an abridgment of the third annual report of the Council of the above-named school which was presented to the annual meeting of supporters on Wednesday :—In consequence of the resolution of the annual meeting of February 1885, which altered the rule (under which the annual meetings were formerly held in February) so as to read "September of each year," the present report and financial statement embraces two sessions, namely, 1884-85, 1885-86. The Council are pleased to be able to speak of satisfactory and steady progress in every department of the school. During the year there have been 2,209 students, 3,081 tickets issued, and 2,241*l.* 11*s.* 8*d.* received in fees. The results of the May science, art, and technological examinations of 1885 and 188 were exceedingly creditable to the school, and were no less satisfactory financially. In the month of May 1885 the Council took into their serious consideration the position of the boys' day school, the numbers in which had shown a somewhat uniform decline for several years, due doubtless to the greatly-increased competition of now well-equipped and efficient elementary schools. Stimulated by the reports of the successful progress of the manual training schools of America, the Council determined to reorganise the school, with a view to the introduction of manual exercises in the use of tools for working in wood and iron, and of giving a more practical direction to the studies generally. In addition to the ordinary staff of the school, a special instructor has been engaged as superintendent of the wood-working department, and the curriculum has been extended so as to include special courses in chemistry, mechanical drawing, and bookkeeping. The experiment has so far proved satisfactory; the boys take great delight in the work, which in no way interferes with their ordinary studies. The Council are of opinion that as the special and practical aims of this department of the school become known its unique advantages will attract an increasing number of pupils, and that it will eventually become self-supporting. The Council regret that, under the changed

COLES, STEWART & CO.,
STOCK AND SHARE BROKERS.

Messrs. COLES, STEWART & CO. undertake every description of Stock Exchange business, and have special and early information on all leading Stocks; they are also continually advised by telegram from the chief Mining centres, both at home and abroad. For Investment Messrs. C., S. & Co. make only one charge of $\frac{1}{16}$ per cent. commission on all descriptions of Stocks, and open Speculative accounts with from 1 per cent. cover and upwards, without any further risk or liability to their clients whatever.

THUS, £5 commands £500 Stock; £10, £1,000 Stock; £50, £5,000 Stock;
And so on to any amount.

In the transaction of speculative business Messrs. C., S. & Co. make no charge for commission or brokerage whatever unless their client makes a profit, when they take 5 per cent. of the profit made as their remuneration.

All transactions advised by wire as soon as completed. Monthly Circulars and Mining Reports post-free on application.

COLES, STEWART & CO., St. Stephen's Chambers, LONDON, E.C.

conditions and aims of the institution, it became necessary to bring to an end its connection with Mr. R. F. Brewer, B.A., who for seventeen years had been the respected headmaster of the boys' day school. This step was not taken without serious consideration, and in parting with Mr. Brewer the Council desire to place on record their warm recognition of his valuable services and their good wishes for his future welfare. The department of theoretical and practical engineering maintains its position as one of the most successful features of the school, numbering upwards of 450 individual students, of whom 30 are day students, who follow a systematic course of study from nine until five each day, in the principles and practice of engineering. The bleaching, dyeing, and printing department shows an increased number of students. The Council are glad to report that the departments of cotton-spinning, weaving, and design, especially that for weaving and design, continue to progress most satisfactorily. Many of the students in the weaving department, feeling their want of some artistic knowledge of design, have entered the art class, the teacher of which, Mr. Glazier, has made himself specially conversant with the manipulation and the technicalities of the loom. In this way it is hoped that the character of the designs produced in this department may be greatly improved. With this object the Council have sought the assistance of the Art Gallery Committee of the Corporation, which has kindly placed at the disposal of the class for the purposes of study a portion of the valuable Bocks collection of textiles. The classes in building construction, which are, perhaps, the largest in the country, are progressing satisfactorily, especially when the depressed state of the building trade is considered. They are attended not only by joiners, bricklayers, masons, &c., but by architects' articled pupils, and they provide considerable advantages to those desirous of becoming practically acquainted with the principles of building construction. In connection therewith instruction is given in masonry, bricklaying, staircase-making, and classes have also been formed for quantity surveying, plumbing, and metal plate work, which have proved most successful. The Council desire to tender their grateful thanks to the numerous friends who have so kindly favoured the school with gifts of appliances and materials for use in the classes and in the various practical departments. The Council of the school have to report an adverse balance of 3,140*l.* 13*s.* 1*d.* at July 31, towards the liquidation of which there is still to receive a science, art, and technological grant.

BIRMINGHAM MASTER BUILDERS' ASSOCIATION.

THE annual meeting in connection with the Birmingham Master Builders' Association was held on Monday evening, at the Great Western Hotel. Mr. J. Bowen presided. The annual report, which was taken as read, stated that the committee regretted that they were unable to record any improvement in the past year, or any prospect of substantial advance in the year just entered upon. The supply of labour in all branches of the trade was still far in excess of the demand, and in consequence it had been decided by the committee, and confirmed at a general meeting of the trade, that notices of a reduction of one penny per hour be served on the operatives in the following branches, viz., bricklayers, carpenters, stonemasons, plasterers, and plumbers. In the latter case, the Association was working jointly with the Master Plumbers and Painters' Association, under the rule, settled on January 1 last, by which the wages were maintained at the previous rate, viz., 8½*d.* per hour, the operatives agreeing to accept the arbitration clause, and to accede to the masters' demand that the hours worked be the same as in the other branches of the trade. The committee believed that in adopting that course they had the hearty approval of every member of the Association, and relied upon receiving that cordial support and co-operation which would alone secure a satisfactory result. The proposed new by-laws of the Corporation Water Department were considered with a sub-committee of the Master Plumbers and Painters' Association, and joint recommendations thereon were submitted to the water committee. That action resulted in several modifications in the direction suggested by the committee. At the request of the National Association, a deputation waited upon Messrs. G. Dixon, M.P., and W. Cook, M.P., as to the amendment submitted to Parliament seeking to make the Employers' Liability Act of 1880 more onerous than at present; also to invite their support to a Bill introduced to repeal a statute of the reign of Queen Elizabeth, under which recently in several boroughs fixed machinery had been assessed for local rating purposes. The vacancy on the council of the National Association, caused by the death of Mr. C. W. Barker, had been filled by the election of the president, Mr. John Bowen. On the acceptance by the Corporation of a design for the new Law Courts, application was made to the Mayor to receive a deputation as to the appointment of a quantity surveyor to represent the builders, and a reply was

IMPORTANT.—To Specialists, Manufacturers, and Others.

Effective Advertising at a Minimum Cost. Now in preparation for Publication in January. Demy 4to, Illustrated.

THE ARCHITECT AND CONTRACTOR'S COMPENDIUM

And Specialist's Directory for 1887.

EDITED BY JOHN E. SEARS, A.R.I.B.A., F.A.S.

An illustrated and priced catalogue and directory of specialities, manufactures, and requirements in every branch of the Building Trade, and in office and workshop, carefully classified and indexed, combined with an Office Diary, Legal and General Information, Copies of Building Acts and By-Laws, Tables, and Memoranda. Illustrations may be inserted produced by the Litho- or Ink-Photo process. In addition to the usual circulation of a first-class Annual, **the Publishers guarantee to send a copy gratuitously to every Architect and Builder whose name appears in the London Directory.** Advertisements will thus for twelve months be in a convenient and attractive form before the eyes of the people Advertisers specially desire to reach, and this **at a cost less than half that of sending out one circular.**

The minimum **guaranteed circulation** of the **Compendium** is 3,000 copies, but the actual circulation will probably reach a much higher figure.

Special attention is directed to the fact that, at great expense, the Publishers have arranged to illustrate this work by the magnificent **Ink-Photo** process, specimens of which are to be seen weekly in *The Architect*. The **Compendium** will thus be far ahead as an artistic production of any class Annual published, adding greatly to its value as an advertising medium. The Ink-Photos can be produced, **without block**, from **any** drawing or photograph, and printed in any tint. The charges are very moderate, and will be quoted on application.

An exceptional opportunity is thus afforded Country and Colonial Firms to introduce their manufactures to the London market. The Compendium will be produced in first-class style, and will doubtless become a standard work of the trade.

Prospectus, with full table of contents, &c., free on application; but Advertisements and Blocks should be forwarded at once to the Advertisement Manager, 16 New Bridge Street, London, E.C.

London: JAMES SEARS & SONS, Printers and Publishers, Crane Court, Fleet Street.

ART PLATES FROM "THE ARCHITECT."

Proof Impressions of the following Illustration which has appeared in "THE ARCHITECT" can now be obtained in a separate form suitable for Framing:—

Handsomely bound in Cloth, Gilt Lettered. Price 12s. 6d. Office: 175 Strand, London, W.C.

received that he would be pleased to do so, but that as the plans were not then finally settled, he would communicate further on their completion. That promise was unfortunately overlooked. The committee next heard, unofficially, that appointments of both surveyors, on behalf of the Council and of the contractors, had been made without an opportunity being given to the Association of even suggesting a surveyor to protect their interests. It appeared to the Association that the appointment of both surveyors by the Council was a great anomaly and an injustice to the trade, and every effort had and would be used to obtain its reversal. The committee regretted that they were unable to report any addition to the number of members, but they had satisfaction in stating that the receipts, for the first time for some years, showed a slight increase over the expenditure. The report was adopted.

OLD LONDON IN NEW YORK.

It will be of interest to English people to know that a street similar to the Old London Street in the Exhibition grounds, which was erected in 1884, is being erected in New York city. A large plot of land has been secured in Broadway, near Eighth Street. The plans for the street in New York are now being prepared by the architect, Mr. G. H. Birch, F.S.A., who furnished the plans for the street at the Exhibition here. It is intended that the shops shall be occupied, as at the "Healtheries," by workmen, with the object of providing, as far as practicable, useful comparisons between ancient and modern handicrafts. It is also intended that some of the shops, especially on the first floor, shall contain selections or exhibits kindred to the subject. The entrance will be from Bishopsgate, and the plan is different from that at Kensington, as it includes two streets parallel to each other, with cross-street, alley, and open square at the end; and many beautiful old houses will be erected of great historical interest which did not appear at Kensington. The only ones which will be reproduced are Whittington's, Isaac Walton's, Oliver Cromwell's, the Hall of the Holy Trinity, and the Old Cock Tavern, Leadenhall Street; while the new houses will include the Tabard (Chaucer's inn), the Falcon, Bankside (Shakespeare's daily haunt), the house of Elias Ashmole, Sir Paul Pindar's house (not the existing portion), Sweedon's passage, Grub Street (close to Milton's house), Sir John Lawrence's house in Great St. Helen's, a portion of the Charterhouse, Butcher's Row, the Old Queen's Head (identified with Sir Walter Raleigh), a bit of Old Hungerford Market, a portion of Old Savoy Palace, Nell Gwynne's house, the cellar of the Old Devil Tavern (Ben Jonson's) under Child's Bank, where Simon Wardloe officiated, the original of "Old Sir Simon the King," and different old houses in Bishopsgate Street, and other old houses not yet decided upon.

RESTORATION OF THE DUOMO, FLORENCE.

The character of the work done at Venice, says the correspondent of the *Times*, supplies no rule for the judgment of what was to be done at Florence, especially on the Duomo, which, with St. Mark's, must, so far as the artistic and historical interests are concerned, be placed in the first places in importance of all Italian churches. The problem in Santa Maria del Fiore has been double, involving not merely restoration but completion. The history of the façades of the cathedral has never been thoroughly searched out, and may some day be the subject of an interesting monograph, in which we shall learn to regret the way in which the revolutions of taste in Italy abolished the genuine old, to substitute spurious new ideals, and of which we have an indication in a passage of Rondinelli, writing of the Duomo:—

> There was a façade of Gothic architecture (*Tedesca*) carried up about to the half-way, full of most beautiful niches intended for statues, which later were put in place; some were by the famous Donatello, and some by other sculptors, artistically done, with most beautiful orders disposed and divided. There one saw several chapels introduced, divided and sustained by most beautiful and varied columns, some smooth and some twisted, so that, what with the variety of marbles and porphyries and the difference of the statues and columns, it had a very rich appearance, and filled with majesty the sight of the beholder.

Then follows a detailed description of what had been done and of the statues of the historical personages introduced, and the opinion as to its general worth that it was equal to its position on the cathedral; but in 1587, being regarded by the Classicists of the day as barbarous, it was destroyed, as Rondinelli says, so brutally that—

> There was no piece of marble that was got out entire—even the columns were broken, which was, in truth, a pitiful spectacle, first, in

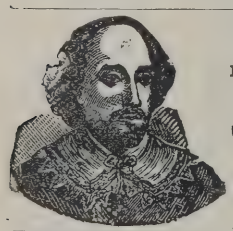
the destruction of the façade, and, secondly, in the breaking of those beautiful marbles and porphyries worked with so much cunning that if they had been taken out whole they would have served for ornaments in many other places with advantage to the works, which would have been able to sell them for some hundreds of scudi.

What consolation there is in proving that former and presumably more æsthetic generations were really more barbarous and tasteless than this we can here obtain and have the grim satisfaction of uttering maledictions on the Florentines of the end of the sixteenth century, as on the Venetians who, in the beginning of the thirteenth, melted the statues of Lysippus to coin money for their soldiers, and later destroyed the Parthenon car of Minerva; the French, who demolished scores of churches in Venice, and the ecclesiastical authorities who have covered Italian basilicas with the garniture and bad painting of the seventeenth century, and whitewashed the frescoes of Giotto and his successors for a hundred years and more. There is really no room for outcry if this generation should at most remove the disguisement of time and decay, and restore to us the noble works left by the great epochs of art in a state approximating to that in which they were completed.

The completion at length of the façade of the Duomo of Florence, which will be unveiled with great ceremony next spring, gives a peculiar appositeness to this and all other questions raised by the process of restoration, because we have here a church constructed by the greatest masters in architecture and sculpture of the Florentine Renaissance, peculiar in style, unique in construction, left to our day wanting its most attractive feature, the front; and this generation has determined that the work left incomplete shall now be completed with the best talent, whatever that may be, which Italy can furnish, and that the problem of how far this new, and therefore necessarily crude, surface juxtaposed with the old and time-toned, shall be harmonised with this.



We had the problem in another shape in Venice, where parts were reconstructed but mainly with the use of the old material, and there two solutions are offered—that of the Ducal Palace, where such new stones as were necessary are coloured to match the old and deceive the eye, and that of the church of St. Mark, where the necessarily added new materials are left to time and the weather to harmonise. In neither case is there any attempt to bring the old up to match the new by removing the *patina* which centuries had given it, for the deprecated rubbing of old columns with pumice-stone, which is attacked by Signor Boni and another of your correspondents, is simply adopted where the effect of the weather and the salt air of the lagoons has been to render the surface of unsculptured marbles, especially columns, carious, and it is adopted because it is necessary to polish the surface to check and retard the action of the corroding agents, which gets more rapid and effective as the surface is made porous and capable of holding fluids. With all due respect to my friend Signor Boni, therefore, I think that Dr. Saccardo is perfectly justified in his use of the pumice in those cases where I have been able to see its use. This point does not come into question at Florence, where there is no action of the sea air, and the ordinary process of calcination which goes on in the open air in all marbles more or less only affects, in the cathedral, certain samples of stone to such an extent as to make them obnoxious. But the question how far new surface and old may be harmonised, and, if at all, whether by the process of toning the new artificially or bleaching the old, has an immense meaning here. Not only will there be the whole mass of the façade entirely new and a portion of the south flank, which was flayed with acids and chisel in the furore for renovation which prevailed in Florence about 1880, but there are throughout the entire surface of the cathedral pieces of the *intarsiatura*, which have been at various times substituted for old slabs which have come away in fragments and powder, as at St. Mark's, and which stare and break the tone of the *ensemble*.

It is premature to pronounce judgment on the work of De Fabris, to whom, after an exhaustive competition, the work was assigned in 1867, until it has been exposed entire to the deliberations of taste for a period sufficiently long to secure a firm judgment, but during a brief partial uncovering of the work in progress I was able to see enough of it to venture the opinion that it will be found, as a whole, quite in harmony with the body of the cathedral, and in itself a work which will do honour to the state of the arts in Italy, and convince the outside world that that state is nobler than is generally believed. All the most eminent sculptors of Italy have competed for the honour of contributing the statues which fill the niches, the owners of all the quarries whence was taken the stone have offered the marbles needed, and so on with all the material, either gratuitously or at the cost of production, while the purely decorative work has been done by the Tuscan stone-cutters, whose business it is to do this kind of work at wages rarely much exceeding a shilling a day, the funds being furnished by voluntary contributions from the nation and the strangers interested in Florence (in connection with which I may notice *en passant*

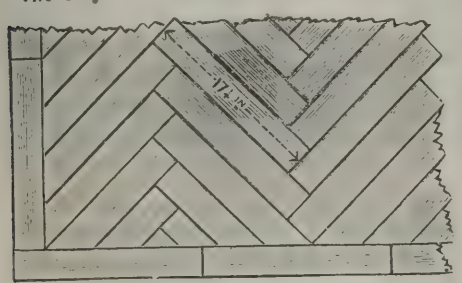
a curious exception to the result of architects' calculations. The original estimate was for 1,500,000 frs., and the work will cost about 1,000,000 frs. !).



This concentration on the façade of all the best talent of Italy, aided by the contributions of the entire kingdom, and resulting in a work which is maintained by some of my friends to be really one of the greatest, if not the greatest, of modern works in decorative architecture, gives the new element an importance in the question of harmonising the parts for which we have no analogical term in the debates on St. Mark's, where no important part was new or merited to weigh *per se* in the balance. The desire of the Florentines to see their Duomo complete, but fresh and new as from the hands of the first builders, glistening like a bride-cake, is comprehensible, for the new as much as the old is their pride, and the general public opinion of the city would, I believe, like to see the surface entirely renewed, so as to be in keeping with the façade. And so far as the architecture pure and simple goes there is this consideration of great weight urged by Signor Del Moro, the architect who has succeeded De Fabris, that the designers of the church made one of the principal features of the design the employment of broad flat surfaces with the relief and motive of the general decoration given by colour, and to this end they employed a ground of white marble relieved with a deep green broken by red. Time and the slow accumulation of incrustations of dust and dirt, with the decomposition of the marble, have degraded the whites to a dingy gray, almost brown, and veiled the dark green to an extent that quite obscures the colour, and in many passages it is difficult to see the line of demarcation between them. Under such conditions it is impossible to realise the idea of the designer, who made his decoration depend on colours which are no longer visible. Therefore, says Del Moro, we must clean this surface of all the incrustations and deposit and bring out the colour of the material, not, indeed, as when it was newly cut, but with that tone alone which age would give it. This idea has prevailed in the restorations, and the whole south flank, from the point where the skinning was stopped several years ago, has been carefully washed with brush and water, all the salient lines and sculptured detail being relieved of the dirt gathered by their projecting surfaces, excepting the gate of the Pisani, which is reserved for later treatment. One face of the south-eastern chapel—that to the rear—has been left in its original condition, and will be so kept as the argument offered to all objectors to the cleaning. This treatment, which may be called of the scrubbing-brush, appears to be most legitimate. Yet it was not, and is not, permitted at St. Mark's, where, though the Republic of Venice employed men to wash the buildings at regular intervals, not even the deposit of dirt is allowed to be removed by washing, and Saccardo complains in his report that where the law now writes on the walls that it is forbidden to befoul it is practically also written that it is forbidden to wash. If larger liberty has been allowed in Florence it is no doubt partly due to the sound logic of Del Moro, who shows that in hiding the colours of the Duomo the design of the builders is really concealed. I think that if some of the energetic English *laudatores temporis acti* were to take the pains to know and discuss with the learned Italian artists who are charged by Government with these works of restoration, never without proper qualifications, what is to be done and why, they would find that the Italian masters understand their business as well as they do, to say the least, and that they are rarely inconsiderate or iconoclastic. And I say this, remembering that I myself once joined in an outcry about the use of acids and the chisel in connection with these very restorations, the only case, so far as I know, where any injury has been done, and this because the late head of the works was unable, from his age and condition, to watch all the work done. The local authorities have sometimes very crude tastes, and the central administration of repairs and restorations has human limitations of strength and watchfulness; so that if Englishmen who know of reprehensible restorations being made will at once notify the proper authorities they will do much more good than by abusing them without sound basis.

THE CONSTRUCTION OF ROADS.

BY THOMAS FAWCETT.

THE chief object sought after in making roads is, or should be, to insure the least expenditure of motive power in the case of vehicles drawn along them. Of course this would be most easily and most thoroughly attained on a perfectly flat surface, as in our railways; but as this can rarely be met with, or even made except at great expense, our next resource is to produce roads of as easy inclines and as solid and hard a surface as we can attain. Now engineers tell us that the average resistance of vehicles is about one-thirtieth of the weight; consequently the incline, or gradient as it is called in these fancy days, should be if possible and as a rule restricted to one in thirty. It is,

Established upwards of a Century.

however, found that a horse for a short time can exert a force about three times greater than its usual traction, consequently the steepest ascent, it is calculated, should not be more than one in ten.

A perfectly level road is not desirable either along its length or breadth, as it often prevents drainage and the off-flowing of water. For a road made of broken stones, the stone should be hard and durable, and not only that, but of uniform hardness and durability—not, for example, a mixture of sandstone and cobble or granite and limestone. Granite, cobble, and limestone are, upon the whole, the most suitable material if they can be had, but this is not by any means always the case; indeed, it looks as if this was to be the great difficulty in the future for the authorities who have to look after the roads. Stones gathered from fields are becoming scarcer every year and more difficult to get. In some places they hardly exist. Granite and cobble will suit any road, so, I take it, will limestone if the road is an incline or kept dry by being well drained. Limestone suits inclines much better than it suits level places that are naturally wet or where the water cannot get away, as the water entering the interstices of the stone soon causes it to decompose and break up. Some limestones are from their chemical and mineral composition much more liable to this than others—some forming a good material, others not being worth the labour of putting on. In all cases where stones are to quarry for road purposes, they should be got and broken when soft from the quarry, some time before they are required, since it is a well ascertained fact that stones are softest when fresh got from the quarry, containing as they do what is called "quarry water," that they become hard after being exposed to the air, and that, when once dried, they may be immersed for any length of time in water without becoming soft again. This is especially worth considering in the case of limestone. The reason seems to be that the water, which penetrates the minutest pores of rocks, deposits, on evaporation, carbonate of lime, iron, silica, and other minerals previously held in solution, and thereby fills up the pores partially. These particles on crystallising are not merely themselves deprived of motion in the pores, but bind together the other portions of the stone; just as mud and sand, say, become as hard as stone under frost—the water in this case being the crystallised ingredient, and so holding together all the separate particles of which loose sand and mud were composed. (Lyell's Geol., p. 39.)

The stones should be broken small enough to pass a two-inch ring as a rule, but circumstances of course alter cases. On roads where carts and conveyances travel this should be strictly the case, but a larger stone is desirable where heavy and rough work only is to be done—as in the case of quarry roads—being less expensive and much more durable. The stones, too, should be all as nearly as possible of the same size with rough and sharp corners for the purpose of setting more compactly—for if not so the larger ones are sure to work up by the shaking of conveyances, and roll about, while the smaller ones will sink in proportion. Unbroken stones, as everybody knows, as, for example, gravel or water-worn stones, do not set unless they are, as it were, glued together by some substance that would do much more harm than good; consequently as a rule they should never be used in road-making unless under very exceptional circumstances. Most vehicles made a few years ago would drive before them a stone above an inch in height, instead of running over it—a process very injurious to the roads, as also annoying to passengers. The wheels, however, of conveyances now are somewhat larger, consequently can pass with ease where others of a smaller size could not. The larger the wheels the less damage to the roads.

The materials should be spread on in layers about 3 inches thick. The whole depth of road need not be more than 6 inches, and in some places—in fact, to all places thoroughly dry, naturally or by draining—4 inches or 5 inches, according to circumstances, will be ample. On no account should the stones be broken upon the roads, that being, to say the least of it, a very slovenly process. Our great road pioneers, Telford and MacAdam, adopted different methods as regards the foundation of a road. Telford used a rough material underneath, sunk in the trenches in soft places to the depth of 3 feet or 4 feet. Not so, however, MacAdam. The native soil was his favourite to build upon, except in rare instances, his object being rather to raise the road than sink it by means of a trench, which, in too many cases, retained the water instead of allowing it to flow off. This native soil if not naturally dry was made so by draining, and then his superstructure of broken stones laid upon it. Then there is another important consideration too often lost sight of by our surveyors and contractors, and that is the season when roads should have the stones laid on. The last week in October and first in November are perhaps the best, all points considered, because the stones have time to set or partially so before intense frost sets in, when the setting process stops. But how many stones are laid on even in the early spring, or at all events, in the close of winter.

BRYANT, POWIS & BRYANT
LIMITED,

As regards the form of a road, the slope should be from the centre to the sides, so that water may flow into the gutters. On inclines this slope should be greater than the incline itself, so that the water may flow to the sides, and not along the road down the steep, as is almost invariably the rule. This is a point, I think, all authorities who have to do with roads ought to consider well, and as far as possible carry out. On level places 6 inches will be sufficient on a road 30 feet wide, and this form should be given to it at first, so that the road material may be uniform in thickness from side to centre, and from centre to side. The very reverse is very often the case. How often do we find among our own roads water flowing not only from or along the sides of the road but down their very centre, that portion being actually the lowest part of the road which ought beyond all question to be highest. How often do we find roads that have a deeply worn track for the horse, and one deeply worn track for each wheel, all three capable of holding a quantity of water, which tends greatly to injure the road. Good side-dressing materially aids not only in giving a road a good appearance, but also in keeping it clean and dry, and a little money spent in this respect is not by any means money lost or squandered. If we studied appearance—what looks nicer than a road well side-dressed during the summer months? I should say side-dress in the spring; but if we study the road practically, then do it before the wet and damp part of the year sets in. The depth of the side gutters should be at least one foot below the road, and the width proportional to that of the road. The wear and tear of material must be replaced from time to time, and the ruts and hollows filled up by spreading fresh stones. In some parts of England—in Yorkshire I have seen it myself—it is customary to cover the roads entirely with stones so far each year; in other parts, as in the Carlisle district, only the portions that require them. On roads laid thoroughly dry, I think the Yorkshire plan a good one, for it has one very good feature, that it does away with that very unpleasant jolting that we so often experience on our roads. When once on the broken stones in Yorkshire, you know what to expect till you get off, whereas in Cumberland we have a smooth portion and then a rough piece fit to throw you out of the conveyance altogether, or at the least to break a spring. The filling up of the ruts and hollows seems to be the greatest oversight among contractors for highway work. Plainly, the oftener this wo k is done, and the thinner the layer, the better it is in all resp cts. Before laying on the new material, the old surface should be loosened with the pickaxe, and on no account should sand, clay, earth, chalk, or gravel be used on pretence of binding the stones together, as they are sure to prevent rather than forward such an object by absorbing and retaining water, which tends greatly to the injury of the roads, especially in frosty weather. Here, however, circumstances may alter cases to some extent. Where a road is not much used, it might be a benefit to the binding process to add a little earth, but in all cases it should be remembered that all so-called binding material becomes only so much scraping in the form of filth to be removed from the road from time to time—in fact, almost for ever. It forms the groundwork of no end of trouble to the contractor, and no end of annoyance to those going along the road. Roads are naturally dirty enough without making them more so artificially. Rather than add dirt in any shape wash the stones before putting them on. Broken stones, if broken as pointed out, will combine of themselves by their angles into a smooth solid surface that cannot be affected by change of weather or displaced by wheels. If our roads were perfectly dry we might defy the weather. Frost could not alter a perfectly dry and clean road. As draining is so essential to the well-being of land, so it is in road-making. There is no greater drawback to our roads than this, that they are in many places—in far too many places—little better than sponges in winter time. After a frost you may rock yourself to and fro on some of them. This arises from bad drainage, or no drainage at all, from high hedges and overhanging trees, which certainly ought to be kept down as much as possible. It is a great mistake on the part of ratepayers to have an objection to draining their roads, as half the expense would do afterwards in the way of metal. It is a penny-wise-and-pound-foolish policy. If all were drained at once, the expense might fall heavily upon men who are here to-day and away to-morrow, but let it be a part of the yearly expense to do a portion where it is required.

To conclude in the words of MacAdam, "The first thought should be that it is the native soil which really supports the weight of the traffic; this should be previously laid dry by draining; an impenetrable covering should be placed over it in the shape of road material, and these should be renewed from time to time as circumstances required." Thus this great road authority in a few words gives us the whole requirements in road-making—an impenetrable covering of stone; a renewal of that covering from time to time; a thoroughly dry support by draining or otherwise; these three, but the greatest of all is draining, not merely as regards durability, but also ultimate saving of expense.

VOLUME XXXV. OF THE ARCHITECT.

Handsomely bound in Cloth, Gilt Lettered. Price 12s. 6d. Office: 175 Strand, London, W.C.

"THE PEDESTAL VASE,"
JENNINGS' IMPROVED W.C. APPARATUS

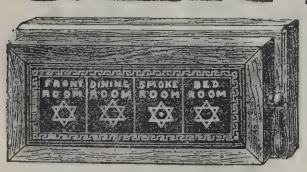
(Combination Urinal and Slop Sink).

Registered No. 16,300.

A PORCELAIN VASE set on a tiled or mosaic floor, within walls or a dado of glazed tiles. The usual wood framing, forming a storehouse for the retention and accumulation of *damp*, *dirt*, and *disease germs*, with the joints, crevices, and imperfections in work which the closet enclosure so often conceals, is entirely abolished. The seat is hinged, permitting free access for use as a *slop sink* or *urinal*, and for cleansing, so that the entire apparatus and space can be freely washed down. For this latter purpose the floor should be slightly sunk, and laid to fall to a grating, with waste carried through the external wall, and terminating in a copper flap valve to prevent draught.

☞ The suggestions as regards wall linings and floor, may, of course, be modified as best adapted to the building in which the closets are used; and in the consideration of such details, alternative schemes will readily present themselves.

At the recent **HEALTH EXHIBITION** (South Kensington, 1884), amongst a series of official tests, under the supervision of Baldwin Latham, Esq., C.E., and the Jury No. 9, Class XXIII, and successfully withstood by this closet, the following may be cited in evidence of its efficient action. Being fixed in position shown in illustration, with **"JENNINGS' PATENT SINGLE FLUSH WASTE-PREVENTING SYPHON CISTERN"** 5 feet over, with 1½ inch down pipe, ten apples (averaging 1¼ inch diameter) and a flat sponge about 4½ inch diameter were thrown into the basin. The water, as well as the whole of the exposed or dry surface, was first blackened with plumber's "smudge," and the sides covered by four pieces of thin sanitary paper, which adhered closely to the soiled surface. The handle of the cistern was then pulled, and the two-gallon flush liberated. After seven seconds (the time occupied by the discharge), a receiver placed under the trap outlet was removed, containing in the blackened water **the ten apples, the sponge, and the four pieces of paper,** no traces of the soil remaining visible upon any part of the apparatus.



GOLD MEDAL AWARDED.

THESE CLOSETS are already in use in Hospitals, Banks, Hotels, Offices, Private Residences, &c., with most satisfactory results, and, fixed in the manner described, in appearance and action leave nothing to be desired. By the novel arrangement of the supply to Basin, as shown in the sectional sketch annexed, the whole surface is well flushed and cleansed, whilst the bottom of Basin and Trap are thoroughly scoured by a concentrated rush of water which insures the **instantaneous removal** of the contents, thus overcoming the inherent defects in the many imitations recently produced of **"JENNINGS' MONKEY-CLOSET"** (the **original form of wash-out watercloset**), which was invented and patented by G. J. in 1852.

REGISTRATION OF PLUMBERS.

GUILDHALL, AUGUST 12, 1886.

1. In pursuance of the Resolutions of the following—
   (a) The Conference of Metropolitan and Provincial Plumbers held at the City and Guilds of London, Central Institute, in October 1884;
   (b) The General Council subsequently formed to give practical effect to the Resolutions of that Conference;
   (c) The Plumbing Trade of London assembled in general meeting at Guildhall, January 25, 1886.
2. A Register for Plumbers of the City of London, and a circuit of seven miles thereof, has been opened by the Worshipful Company of Plumbers.
3. The object of the Registration is to enable the public to distinguish between qualified and unqualified practitioners.
4. All applications are considered by a Special Committee of Registration, which includes Members of the General Council as well as practical Plumbers, in order that no trade interest or prejudice may operate against any Applicant, but, on the contrary, that the utmost fairness and impartiality may be secured to all.
5. Plumbers (Masters and Journeymen) established in the Trade prior to March 1, 1886, are not necessarily required to undergo any examination. Admission is granted to such Plumbers on satisfactory statement or proof of experience, according to the circumstances of each case.
6. All Applicants who cannot satisfy the Registering Committee of their experience are required to pass an examination by a Board of Examiners, composed largely of practical Plumbers.
7. No Plumber entering the trade after March 1, 1886, will be admitted to the Register unless he shall have passed an examination in the technology and practice of plumbing.
8. The Company is not connected with any Plumbers' Societies or Trade Organisations formed for other purposes, and the function of the Registering Committee is confined to distinguishing those who are fairly entitled to be registered as qualified Plumbers; the object being thus to raise the standing and efficiency of Plumbers as a body in a manner consistent with the important position they occupy in relation to the public health.
9. The Registration of the Plumbers of the London District is adopted as a preliminary step to the extension of the system of Registration throughout the Kingdom by means of Local Organisations.
10. Pending the establishment of Local Registers, Provincial Plumbers are admitted to the Company's Register on the same conditions as the Plumbers of the London District.
11. Plumbers admitted to the Register receive Certificates of Registration bearing the Company's Seal and Arms, A.D. 1568. None but the holders of such Certificates are entitled to use the letters R.P. (Registered Plumber) after their names. Lists of the names and addresses of Registered Plumbers are obtainable on application to the Company.

GEORGE SHAW, Master.

CONTRACTS OPEN.

BARNES.—Dec. 1.—For Extension of Girls' and Infants' School, Westfields. The Clerk, School Board Office, Barnes, S.W.

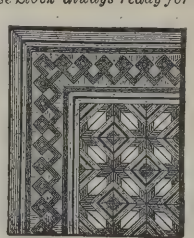
N.B.—Size and height of window no object.



TESTIMONIAL.
BANGOR, N. Wales: September 14, 1885.
Sirs,—I have pleasure in testifying that I have used Leggott's Silen. Adjustments for various buildings to high skylights, fanlights, and top parts of windows, and in every case they gave satisfaction. They are secure in whatever position, whether the window is open or closed, and are quite simple and workable in their action. I prefer them to any other that I have seen or used for the above-mentioned purposes.—I remain, yours obediently, R. DAVIES, Architect.

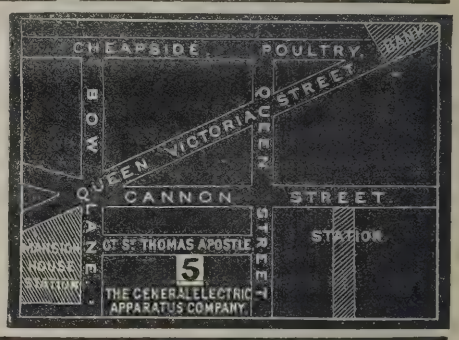
NOTES ON NOVELTIES.



A Sanitary Sewer Gas Trap.—It is claimed for this patent that it meets the demand for a thoroughly sanitary trap—that is to say, it completely shuts off gas from the dwelling. This will be more clearly understood from the appended illustration, the main feature of which is the valve intercepting the escape of all miasma, and being perfectly air-tight. It also prevents back water in main sewer, whether from rain, tides, or other defects, from flooding cellars and basements. The illustration shows the flushing-gate and tide-gate, by which a continual flushing with waste water is going on, thus effecting ventilation

at the same time, and preventing any accumulation of matter. This patent, in short, isolates houses from main sewer—a most important consideration with sanitary authorities. With a trap like this in general use, it would be impossible to hear of main sewers bursting and penetrating dwellings, which is now so commonly the case. We have inspected this patent of Messrs. Titus & Hinksman's, and consider it a sound improvement. It has been brought to this country from America quite recently, but has already been adopted by the Board of Health and other authorities. The sole London

IMPORTANT.—To Specialists, Manufacturers, and Others.
Effective Advertising at a Minimum Cost. Now in preparation for Publication in January. Demy 4to, Illustrated.
THE ARCHITECT AND CONTRACTOR'S COMPENDIUM
And Specialist's Directory for 1887.
EDITED BY JOHN E. SEARS, A.R.I.B.A., F.A.S.
An illustrated and priced catalogue and directory of specialities, manufactures, and requirements in every branch of the Building Trade, and in office and workshop, carefully classified and indexed, combined with an Office Diary, Legal and General Information, Copies of Building Acts and By-Laws, Tables, and Memoranda. Illustrations may be inserted produced by the Litho- or Ink-Photo process. In addition to the usual circulation of a first-class Annual, **the Publishers guarantee to send a copy gratuitously to every Architect and Builder whose name appears in the London Directory.** Advertisements will thus for twelve months be in a convenient and attractive form before the eyes of the people Advertisers specially desire to reach, and this **at a cost less than half that of sending out one circular.**
The minimum **guaranteed circulation** of the **Compendium** is 3,000 copies, but the actual circulation will probably reach a much higher figure.
Special attention is directed to the fact that, at great expense, the Publishers have arranged to illustrate this work by the magnificent **Ink-Photo** process, specimens of which are to be seen weekly in *The Architect*. The **Compendium** will thus be far ahead as an artistic production of any class Annual published, adding greatly to its value as an advertising medium. The Ink-Photos can be produced, **without block**, from **any** drawing or photograph, and printed in any tint. The charges are very moderate, and will be quoted on application.
An exceptional opportunity is thus afforded Country and Colonial Firms to introduce their manufactures to the London market. The Compendium will be produced in first-class style, and will doubtless become a standard work of the trade.
Prospectus, with full table of contents, &c., free on application; but Advertisements and Blocks should be forwarded at once to the Advertisement Manager, 16 New Bridge Street, London, E.C.
London: JAMES SEARS & SONS, Printers and Publishers, Crane Court, Fleet Street.

agents are Messrs. Goodman & Co., of 72 Bishopsgate Street, E.C., a well-known firm of brick merchants, under whose influence the trap will, no doubt, prove a decided success.

TRADE NOTES.

MESSRS. EDGAR KEELING, TEALE & Co., art metal-workers, of 14 Elm Street, Gray's Inn Road, W.C., have received an order from the directors of the Union Bank of Australia, to supply about 100 feet of polished brass desk rails for their London premises opposite the Bank of England, recently altered and enlarged under the superintendence of Mr. McGoymour Cuthbert, A.R.I.B.A., of Queen Street, Cheapside. The door furniture, &c., and a quaint wrought-iron grille in the vestibule, are also supplied by the same firm.

THE mosaics covering the entire north wall of Chester Cathedral, contributed by Mrs. Platt, formerly of Dunham Park, have been finished. The execution of these wall pictures has been in progress some time, in a series of panels specially constructed for them. One or two have been placed in position many months, and others more recently. The full series of eight pictures of scriptural subjects are arranged in pairs, with a smaller narrow portrait panel between. The figures are life-size. The mosaics are the work of Messrs. Burke & Co., of London and Paris.

THE IRON INDUSTRY OF GERMANY.

A DESPATCH, dated October 25 last, has been received from Sir E. B. Malet, Her Majesty's Ambassador at Berlin, enclosing the following report on the present condition of the iron industry of Germany :—

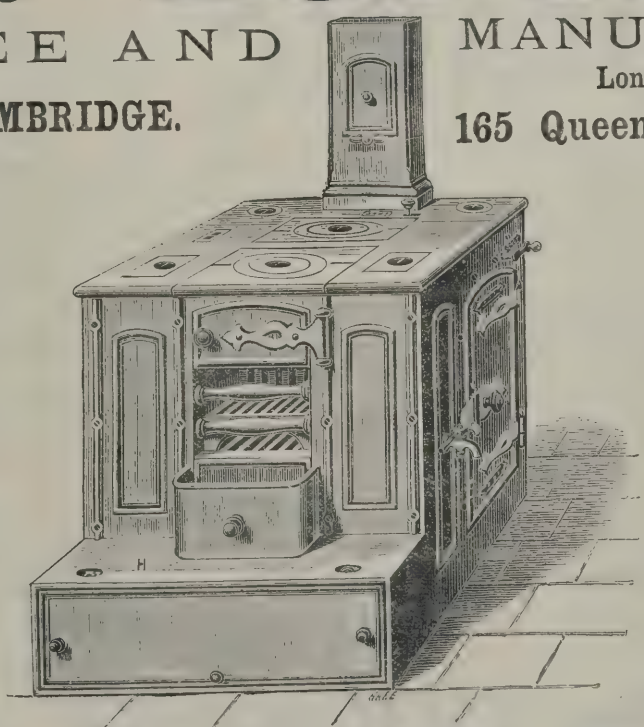
The iron industries of Germany have been for some time in a very depressed condition, prices being very low, owing to the keen competition which exists between the German producers for the retention of the home market in which they are being undersold by foreign competitors. Prices have been steadily falling during the last few months, and there is every probability of their reaching a lower level yet.

The competition is chiefly on the part of English and Belgian firms who are accepting contracts at ruinous rates in order to retain a hold of the German market. Three months ago the Altona rail contract was given to a German firm (Krupp of Essen) only after it had reduced its estimates to the level of the English offers, 117 marks a ton, and in September the English firm of John Cockerill, established near Liége, offered to provide 5,000 tons of rails for the left Rhine Railway at the rate of 101 marks per ton, while the German offers varied between 104·50 and 107·50 marks. A year ago the average price of rails per ton for home contracts was 130 marks ; fifteen months ago it was 144 marks, which shows how great has been the fall in the value of iron. The reports from the Rhenish Westphalian iron district contain loud complaints as to the little demand for native ore. It is stated that the Westphalian firms cannot go on producing iron for the money, and that this is one of the worst summer seasons they have known ; there is talk of discontinuing the working of some of the mines. The competition of Spanish raw iron seems to be severely felt, owing to the low rates of freightage.

Railway material is in little demand, and the price of steel rails is so low by reason of foreign competition, that most of the steel manufacturers are only working five or six shifts weekly against thirteen formerly. This depression in the steel industry causes Bessemer iron to be neglected. The production of pig iron by the Rhenish Westphalian and Nassau furnaces during August was 93,944 tons against 97,158 tons during the same month last year.

The machine, waggon, and boiler works report no progress ; pipe foundries and the rolled ironworks are rather better employed, and the rolled wire business seems also to be looking up a little, but most of the works in this district are now being carried on at a loss.

From the Silesian iron district come likewise general complaints as to the unsatisfactory state of the iron trade, and as to the ruinous competition which now exists, which forces prices down to an abnormally low level. Two years ago the Vulcan ironstone mines ceased working, and now what was once considered a very prosperous mine, the Bergfreiheitsgrube, has been closed. The competition of Westphalia is keenly felt in this district, and the export of rolled iron to Austria and Russia has much fallen off of late.



It is said, however, that during the last few weeks some large transactions have taken place in pig iron, by which affairs have rather improved, and recent reports say that for the moment foundries are fairly well employed, but prices are still so low that the pig-iron producers have agreed to limit the production of pig iron to the present amount, about 7,000 tons

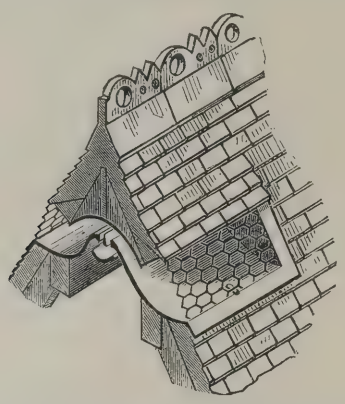
COOKING-RANGES.

LOFTS' PATENT STOVES

Will burn any kind of Coal or Rubbish, consume their own Smoke, and require only one-fifth the Fuel of any other Stove.

After four years of tedious experiments I have been able to produce what has long been required, viz., Domestic Stoves which consume only one-fifth the quantity of Coal (*One Ton instead of Five*) required by any ordinary stove, at the same time giving as great an amount of heat and more thorough ventilation. I have great confidence in recommending these to the public. Since perfecting them I have tried them for six months in the worst of smoky chimneys, and they have not failed in any one case ; have shown them at work to a large number of scientific, medical, and practical men, and they have given but one opinion, which is that, as regards heat, health, and comfort, they are perfection, and they have not seen or heard of anything to equal them. The fire-grate is perfectly open, like the register or slow-combustion stoves now in use ; they are neat, strong, and easy to understand ; will burn any kind of coal or rubbish ; consume their own smoke ; are lighted just in the same way as an ordinary stove, and draw up as quickly and as easily.



Full particulars on application.

To be seen in action at London Show-rooms, 165 Queen Victoria St., E.C., or at Cambridge.

a week, and not to put any more furnaces in blast for a year. At present the Donnersmarckhütte has two furnaces out of five in work, the Julienhütte two out of four, the Tarnowitzerhütte one out of four, and the Gledwitzerhütte one out of two.

BOYLE'S LATEST IMPROVED CONCEALED ROOF VENTILATOR.

MESSRS. ROBERT BOYLE & SON, Limited, have introduced an adaptation of their latest improved form of the self-acting air-pump ventilator (1882 patent), to be employed in a concealed form as shown in accompanying diagram. It is intended, how-

ever, only to be employed where it is impracticable or deemed unadvisable for æsthetic reasons to use the ordinary turret form of ventilator, and is provided to meet such cases, as being a simple means of securing a change of air without disagreeable draughts, which usually accompany ordinary and imperfect methods of ventilation. The modification, as shown in the diagram, is so arranged that it utilises by direct action any wind which impinges upon it, and so loses none of its force, as is the case where a complicated arrangement of pipes is used, which obstructs the wind and nullifies its aspirating power, owing to the amount of friction and the angles which have to be contended with. Any arrangement of this kind must necessarily be of the simplest description and free from angles or pipes, which will cause undue friction, otherwise it can only be a ventilator in name, as any vitiated air which may pass through it will certainly not be due to its action.

The concealed roof ventilator operates by the action of the wind passing in at one side, over the central slits, and out at the other side. In its passage it draws the vitiated air out of the building through the slits. It is free from downdraught and impervious to rain or snow. It can be constructed to suit either open or ceiled roofs. This ventilator is recommended as being the most powerful, reliable, cheapest, and safest to use of any of its class, and it can be made any size to suit all kinds of buildings; but it is pointed out by Messrs. Boyle that as ventilators of this class cannot be fully operative except when the wind is in certain directions, it is liable to the objection which applies to every form of concealed roof ventilator, that there will be certain periods, according to the direction of the wind, when its power as an exhaust will be reduced, and for this reason the ordinary turret form of the air-pump ventilator is recommended in preference where it can at all be employed, as it acts with equal efficiency with the wind blowing from any direction.

With the concealed roof ventilator, as with all other extraction ventilators, adequate provision must be made for the admission of fresh air to insure its effective action.

WOOD PAVING IN EDINBURGH.

A MEETING of the Streets and Buildings Committee of the Edinburgh Town Council was held on Friday last, when a report on the state of the carriageway at Forrest Road was brought under discussion, and it was resolved to recommend the Council to lift the wood and replace it with whinstone blocks. Chambers Street was also referred to, and the recommendation upon it was that whinstone crossings should be laid at each end of that thoroughfare. It appears that the wood has proved much more expensive than whinstone, and it is not likely that any of the carriageways in Edinburgh will again be laid with it. It is just twelve years since Forrest Road was laid with wood, and its condition is now such that it is absolutely necessary it should be repaired. On account of its unendurable nature the Committee have determined that if possible wood shall not again be resorted to, but that whinstone, which usually lasts for twenty years, should be used instead.

CHURCH OF ST. MARY WOOLNOTH, E.C.

THIS church, after having been closed for some time past, was reopened on Sunday last. The noisome effluvia arising from the vaults beneath the church, and penetrating into the building itself, rendered it imperatively necessary that some effectual steps should be taken to remedy the evil. Accordingly, under the direction of Mr. F. C. Penrose, the entire surface under the vault arching has been covered with a system of iron joists and concrete, upon which has been laid asphalte in two thicknesses, viz., ½-inch polonceau and ½-inch seyssel, the asphalting being executed by Messrs. Pilkington & Co., of 15 Fish Street Hill, E.C. Messrs. Holland & Hannen were the general contractors, Mr. Gathercole being clerk of works.

THE LIVERPOOL EXHIBITION AWARDS.

A FURTHER glimpse of the way in which some of the juries of the late Liverpool Exhibition were organised was afforded by the bankruptcy proceedings of a Mr. John Jones before the registrar of the Liverpool Bankruptcy Court. Mr. Jones's debts amounted to 217*l.* 5*s.* and his assets to 5*l.* The examination was adjourned, but in the course of it the debtor said that years ago he was in partnership with his uncle as a builder, and then had a capital of 500*l.*; but the business failed, the uncle died, and he was left without any means. He had since held situations as a clerk; his last engagement was on the work of levelling the site for the Liverpool Exhibition. A month before and a month after the opening he earned about 3*l.* a week in commissions from dealers in building materials, &c., and since then about 35*s.* a week. He sold goods in the exhibition for certain exhibitors, taking persons to the stalls to see the goods, and also was paid by two or three for keeping their stalls clean and in order, for which purpose he employed a boy. The Official Receiver: Have you acted in any other capacity in the Exhibition? The debtor: Just recently, sir, I acted as a juryman in the department of building materials, &c. He went on to say that he believed he was nominated by several firms in London, Birmingham, and other places, and the executive committee notified his appointment to him. He acted as juror for materials he was selling, and for any sort of building materials. He considered that quite consistent with fairness. He did not inform the executive committee that he was also a salesman for the goods in reference to which he was to act as juror, and also a servant of certain exhibitors. The Registrar: I am glad that the debtor has answered in that way. I am quite sure that no committee of gentlemen would ever think of appointing a man who they knew was a servant in the same department in which he was to act as a juror. This, however, is not quite the place for investigating that question. I think it would have been much better if the debtor had informed the committee what his position was. It was most reprehensible conduct not to have done so, since it destroyed all faith in the verdicts of jurors so appointed.

A COMMERCIAL MUSEUM FOR WOLVERHAMPTON.

IN pursuance of their scheme for the establishment of a commercial museum in connection with the Wolverhampton Chamber of Commerce, the council of that body have just applied to the Secretary for Foreign Affairs that he would instruct Her Majesty's consul at Madrid to procure and transmit to the Wolverhampton Chamber a full collection of the locks in common use in Spain other than those of English make. The council also desire to be informed at what prices the locks can be bought from the makers, and whether such prices include delivery into Spain and the Customs duties. The council express their willingness to defray the cost entailed if in the opinion of the Secretary for Foreign Affairs the expense is not one which can be properly borne by the Government. It is explained by the council to Lord Iddesleigh that the purpose of the museum is to enable the manufacturers and artisans of the district to clearly understand what is the nature of the competition with which they have to contend in foreign and colonial markets. His lordship has agreed to the proposal.

THE EDINBURGH DEAN OF GUILD COURT.

A PAPER was read at the last meeting of the Edinburgh Architectural Association by Sir James Gowans, Lord Dean of Guild of Edinburgh, on "The Aims and Purposes of the Dean of Guild Court." The Guild Court of Edinburgh was constituted by an act of the Town Council, of date March 3, 1584, and ratified by Acts of Parliament. It consisted then of seven persons, of whom four were merchants and three tradesmen, who were also guild brethren. The powers of the Dean of Guild Court were, in his opinion, if fairly applied and maintained, sufficient to secure the erection of sound and efficient

LES STYLES.

OVER SEVEN HUNDRED ENGRAVINGS OF DIFFERENT PERIODS, WITH DESCRIPTIONS
BY PAUL ROUAIX.

"This large and sumptuous book is issued by the publishers of *L'Art*, a journal which we have frequently referred to as being one of the best publications of its kind in Europe. The French Librairie de l'Art has been known for long in connection with works treating of the fine arts, and *Les Styles* is certainly equal to anything we have ever seen of the kind, and by far superior to the vast majority of similar works issued in this country. There is something about the atmosphere of France which confers refinement of taste in everything relating to designs, and so pronounced is the national aptitude for discovering beauty and symmetry, that the very fact of a book coming from across the straits is generally a sufficient guarantee of the artistic excellence of the contents.

"M. Rouaix treats of many species of decoration, commencing with that in vogue amongst the ancient Egyptians, and proceeding in regular order of date with the Etruscan, Greek, Byzantine, Roman, Gothic, the peculiar ornamentation of the Renaissance, and of the times of Louis XIII., XIV., XV., and XVI. Before each division the author introduces a short historical introduction, and afterwards, by means of a series of beautifully executed prints, illustrates the prevailing fashion of the time. For this purpose he has levied contributions on examples of architecture, carving on wood, suits of armour, bas-reliefs, tapestry and embroidery, mural painting, mosaical work, and a host of other subjects, including caskets and chalices. In fact, anything that can be called artistic and assigned with certainty to a particular era is represented, the result being an exhaustive and exceedingly pretty production."—BOOK LORE.

Beautiful plates. Examples of the finest colour printing, and for variety and grace of design they could scarcely be surpassed. Decorators might gain many hints both for designs and schemes of colour by a study of this excellent publication."—GRAPHIC.

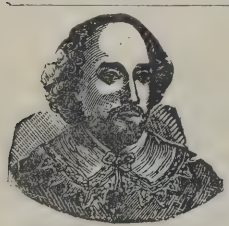
houses, and also very completely to control all sanitary matters connected therewith. While they in Edinburgh had such control, the misfortune was, he thought, that there was no general law for Scotland, equivalent to what they possessed, and this led him to say that there clearly ought to be a Health Act for the whole country in harmony with the best sanitary science as practised at the present day, and that above all there ought to be a Minister of Health who would have a seat in the Cabinet. Speaking more particularly of the aims and objects of the Court, he said it would not be very difficult to prove that the public themselves were the creators of the cheap shoddy buildings so much complained of. There appeared to be in some people an instinctive craving for cheap things. If bearing the semblance of the costly and superior article, so much the better. The builder was a shrewd man, as a rule, and watched public leanings, and felt the public pulse. He knew the price that would be obtained for his houses, and his plain duty was to adapt his outlay to the price expected. The visits of a vigilant inspector were intensely disagreeable where, for example, the foundations were laid in an insufficient manner; where his mortar was an admixture of mud and sand, with a sprinkling of lime; where the wooding of the structure was insufficient, and the cover of the slating was inadequate; where the drains and plumber work were badly arranged or of faulty materials. It was an infliction in such a case for tests to be applied and certificates demanded before a sale could be effected. He regarded the properly-applied functions of a Dean of Guild Court as having a paramount influence on the quality of the article which the public received for its money in purchasing the house. He then drew attention to what the Dean of Guild Court required before authorising the erection of new houses and buildings or the alteration of old ones, special reference being made to sanitary and lighting arrangements. He suggested that in the better class of houses it would be well worth while to have the gas and water-pipes so arranged as to form a decorative feature on the walls of the apartments, and in every case at least to be exposed so as to be readily accessible. He considered that their Police Act was far too moderate in its requirements as regarded open space in the rear of houses. Its minimum standard was not to be less than half the area of the building itself, and it was surprising to see how the minimum was tenaciously adhered to, as if it were challengeable should more be conceded. The only effectual remedy would be to have the minimum standard increased, as was contemplated in the proposed general Police Act, where the standard of one-half became three-fourths of the building area. Other two important functions devolving upon the Court were the protection of private rights and interests and the protection of public interests. Although the building trade during last year was by no means brisk, they had 861 cases before the Court, being an average of over 16 cases for each of the 52 Court days. Of these 515 were new applications, and in all 391 warrants had been granted, of which 106 were for new buildings. In conclusion, he said that the aims of architects and of the Dean of Guild Court were one and the same. They had laid upon their shoulders the responsibility of preventing any marring or disfigurement of the architectural fame and amenity of their noble city, and of maintaining and extending the same in proportion as her boundaries were enlarged. In such a work as this the Dean of Guild Court's best efforts and architects' best talents must be enlisted.



BIRMINGHAM MASTER BUILDERS' ASSOCIATION.

THE annual dinner in connection with the Birmingham Master Builders' Association was held on the 18th inst., at the Great Western Hotel. Mr. J. Bowen (president of the Association) presided, and there was a large attendance.

Mr. C. H. Barnsley, in submitting "The Town and Trade of Birmingham," praised the town for its cleanliness and sanitary arrangements, which he said were due to the excellent supervision of the Town Council. Owing to that the town was healthier than it otherwise would have been, and the death rate was lower than that of almost every other large town in the kingdom. The Town Council, he believed, had honestly and nobly carried out the letter and spirit of the motto of the town, "Forward," and they deserved the gratitude of the inhabitants for the earnestness with which they worked for the benefit of the town. During the past thirteen years great improvements had been effected in Birmingham. The Improvement Scheme had found a large amount of work for the artisans, and the noble buildings—both public and private—with which the town was studded, had been the means of giving employment to large numbers. He deplored the present depression of trade, and the fact that the prices for the work done were so low. Out of 123 towns in Great Britain from which reports had been received only eight reported that the building trade was fairly good or improving, the others reporting that it was bad or very bad. Unfortunately for the trade,

the contractors and builders of Birmingham had had very little opportunity of boasting; but that was due chiefly to those people who had contracted for the work at unremunerative prices, if not actual losses. Such a state of things as that was calculated to destroy all genuine and legitimate competition, and that was greatly to be regretted. He hoped, however, the time was not far distant when they would be able to congratulate each other on a great improvement in trade, and the fact that they could command very much better prices. Mr. J. W. Bond responded.

The Chairman proposed "Success to the Birmingham Master Builders' Association," remarking that the present was a time when they must not only wish success to the Association, but work earnestly in aid of the objects for which the Association was established. The question of the wages of the operatives was an important one, and they were looking forward to an arduous task in dealing with the matter. Almost every trade association was successful in regulating the prices connected with the trade, but hitherto the Builders' Association of Birmingham had been unable to do that. They ought, therefore, to put themselves in a position to be able to do it. Of course, in attempting that they would have many difficulties to overcome; but if the contractors of Birmingham came to a definite understanding not to take work under a certain rate—a rate at which the work could be produced—then it would be to the advantage of all concerned. He often thought the Association should lay down a code of rules for the guidance of the trade, and he hoped it would not be long before they did so. He was glad to see that the Association was awaking to the difficulties and responsibilities of the trade, and he trusted that a great improvement would soon be effected. The members did not object to competition so long as it was healthy and fair, but he did not think a great deal of the competition in the town had been healthy and fair. He hoped, however, that unfair competition would soon be a thing of the past in Birmingham, and that every member would act more in the interest of the trade generally than had been the case hitherto. The operatives banded together in their own defence, and the masters should do the same. In his opinion it was a question whether a great deal of the work produced of late was worth the money it cost to produce in the open market. If that were so, there was certainly something wrong, and the sooner they endeavoured to find a remedy the better. They suffered a great deal from foreign competition, but he was sure they could do the work as well, if not better, than their foreign competitors. They did not ask for large profits. They were prepared to take the minimum amount of profit, but many of them, he was glad to say, would not accept contracts at a less price than the work could be done for. In conclusion, he expressed a hope that on the wages question the operatives would meet the masters in the same spirit in which they would be met, for if they did he felt sure they would be able to reason together and come to an understanding, which would be best for all parties concerned. Councillor Loughton, Mr. A. Edwards, and Mr. J. M. Bayley responded. The other toasts were, "The National Association of Master Builders of Great Britain," "The President," "The Vice-President and Officers," and "The Visitors."

LIVERPOOL MASTER BUILDERS' ASSOCIATION.

THE annual banquet of the Liverpool Master Builders Association was held on the 18th inst., and was attended by about one hundred gentlemen. Mr. James Leslie, the president of the Association, presided, and was supported by Messrs. J. B. Smith, Isaac Morris, G. E. Grayson, E. S. Kirby, F. W. Hornblower, Blease, J. H. Farmer (town clerk of Bootle), W. N. Blair (surveyor of Bootle), Thorburn (surveyor of Birkenhead), Huntington (Lancaster), J. C. White, T. Cook, F. N. Holme, Green, J. S. Jones, R. Jones, W. Tomkinson, C. Tomkinson, G. Woods, Forde, Nobbs, W. Knox (secretary), J. Tanner, C. Tanner, J. E. A. Rogers, Johnson (Wigan), Beaulard (Bradford), Belshaw, Rothwell, and Chisnall (St. Helens).

After the customary loyal toasts had been drunk,

Mr. C. Tomkinson proposed "The Mayors and Corporations of Liverpool, Birkenhead, and Bootle."

Mr. J. B. Smith, in responding, said there was no doubt that the interests of Liverpool, Birkenhead, and Bootle were not altogether identical. He had always thought that the interests of Liverpool had to a great extent been sacrificed to those of Birkenhead. It was perhaps rather a matter of controversy, but unquestionably there had been an enormous amount of money sunk in Birkenhead, which if it had been stopped years ago might have made Liverpool now very much of a free port. That must always be a matter of regret even to those who lived on the other side of the water. With reference to Bootle he would also say that he thought it a pity that Bootle was not incorporated with Liverpool. It was a very curious fact that the most valuable part of the trade of

VOLUME XXXV. OF THE ARCHITECT.
handsomely bound in Cloth, Gilt Lettered, price 12s. 6d.
Office: 175 Strand, London, W.C.

Liverpool had now left Liverpool, and had centred in Bootle. That seemed a very unfortunate circumstance, and he should have preferred seeing Liverpool and Bootle represented by one mayor and one corporation. As chairman of the Health Committee of the Liverpool Corporation, he could say the Committee had always had the most friendly feeling towards the master builders of Liverpool. They considered that to a very great extent their interests were identical, and the Committee had always endeavoured to work with the master builders in the most friendly way possible. He trusted such a relationship would continue to exist.

Mr. James Pendleton, in submitting the toast of "The National Association of Builders," remarked that the Association was comprised principally of representatives from about forty or fifty of the large towns in the country. It was supported by subscriptions from those towns, and he was happy to say that Liverpool had even contributed more last year to the Association than London. The Association had done a great deal for the building trade, and they in Liverpool had cause to thank the representatives of the National Association for the trouble they had taken in representing them in London and other places where important deliberations had taken place, which had resulted beneficially to the trade.

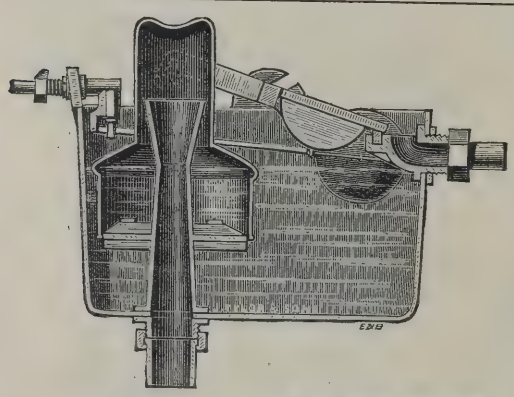
Mr. J. C. White responded, and said he believed if the objects of the National Association were better known it would be hailed with enthusiasm all over the country. It would have a very great power for good and very little or no disposition for evil. The Association as yet was in its infancy, being only eight years old, and for the last two or three years had gone through bad times. He hoped the Association would go on and prosper, and had no doubt that in time it would become an exceedingly powerful organisation.

Mr. E. Kirby next gave "The Liverpool Master Builders." He said the Liverpool Master Builders' Association deserved all the sympathy it could get from the Architectural Society and architects individually in the town of Liverpool. He need hardly remind them that Liverpool had twice chosen one of the members of the Association as its chief magistrate. He expressed the hope that the new year would see the clouds roll by, especially as applicable to the building trade.

Mr. W. Litt, who responded, said that ever since the Liverpool Master Builders' Association was formed twenty-one years ago it had endeavoured to act purely on the defensive, and not to injure in any way the interests of the working-classes. Their object was to guide a business which they considered most important not only for a district, but for the nation at large. In every scientific improvement the builders had endeavoured to act well up to the times and to assist in bringing those improvements to bear in the buildings of the day.

The remaining toasts included "The Architects, Surveyors, and Civil Engineers," "The Iron Trade and Kindred Associations," and "City and Trade of Liverpool."

BERMONDSEY MORTAR.



RECENTLY the inspector of nuisances of the parish of Bermondsey reported to the Vestry that sediment taken from the public sewers was being used by a builder as mortar in the construction of houses being erected in Long Lane, Bermondsey. Owing to the offensive smell arising from the stuff the inspector, considering it injurious to health, ordered its removal. The Vestry instructed the clerk to write to the Metropolitan Board of Works upon the subject, as it was stated that the contractor for cleansing the sewers under their control was in the habit of selling the refuse taken from the sewers to builders, who used it for mortar. The vestry clerk has now received a letter from the Metropolitan Board to the effect that they have given strict injunctions to their contractor to refrain in future from the objectionable practice.

THE SANITARY REGISTRATION OF BUILDINGS BILL.*

SANITATION is in the air, though the public mind may be slow to realise the truth of the adage that cleanliness is next to godliness, and that in reality sanitation is the science of cleanliness, and a science which becomes of importance in proportion to the density of the population.

With the growth of population there has grown a sense of the need of giving more attention to the science of cleanliness, and at present we have a mass of sanitary legislation which, while failing to secure satisfactory conditions with regard to the removal of refuse from our towns, at the same time gives greater powers to local authorities than they have hitherto exercised.

* A paper by Mr. Mark H. Judge, read at a meeting of the Society of Medical Officers of Health, November 19, 1886.

BEAN'S PATENT DIRECT-ACTING VALVELESS WASTE-PREVENTING CISTERNS.

These Waste-Preventers are simple in construction and rapid and powerful in action. The working parts have been improved and are well balanced. The arrangements for charging the siphon are such that a slight pull by hand is all that is necessary to cause the immediate and automatic discharge of the contents of the Cistern.

THE CHIEF ADVANTAGES are—(1) the direct-acting method of charging the siphon, by which the full flush is obtained at once; (2) simplicity of construction; (3) no valve in the bottom of the cistern to cause leakage; (4) no tight-fitting parts to corrode or get out of order; (5) no waste incurred by fastening the "pull"; (6) insures a rapid and regulated flush without holding down the pull.

COLES, STEWART & CO.,
STOCK AND SHARE BROKERS.

Messrs. COLES, STEWART & CO. undertake every description of Stock Exchange business, and have special and early information on all leading Stocks; they are also continually advised by telegram from the chief Mining centres, both at home and abroad. For Investment Messrs. C., S. & Co. make only one charge of $\frac{1}{16}$ per cent. commission on all descriptions of Stocks, and open Speculative accounts with from 1 per cent. cover and upwards, without any further risk or liability to their clients whatever.

THUS, £5 commands £500 Stock; £10, £1,000 Stock; £50, £5,000 Stock;
And so on to any amount.

In the transaction of speculative business Messrs. C., S. & Co. make no charge for commission or brokerage whatever unless their client makes a profit, when they take 5 per cent. of the profit made as their remuneration.

All transactions advised by wire as soon as completed. Monthly Circulars and Mining Reports post-free on application.

COLES, STEWART & CO., St. Stephen's Chambers, LONDON, E.C.

As an instance of the great powers conferred by Parliament on the local authorities with regard to sanitary matters, I have only to refer to the Metropolis Local Management Act of 1855, under which Act the London vestries have absolute authority to regulate the sanitary arrangements of every house or building, whether erected before or subsequent to the passing of the Act, provided there be a public sewer within 100 feet of such house or building.

These powers were, and are to this day, greater than public opinion would tolerate the exercise of, and therefore to a large extent the Acts under which they have been granted have been dead letters. Indeed, they have been less operative than more modest provisions would have been, for, as a chain is only as strong as its weakest link, so a law which is never put, nor even attempted to be put, into operation in its entirety is thereby made more difficult of application in every respect.

According to the 73rd section of the Metropolis Local Management Act, the vestries of London are not only responsible for the public sewers and house drains, but for the sanitary arrangements generally, including "fit and proper sinks, water-supplying pipes, cisterns, and apparatus." I say that the vestries are responsible for these things, because the Act in question empowers them to insist on these arrangements being such as they shall deem to be satisfactory.

Similar powers are conferred upon local boards of health under the Act of 1875, but it is modified by the supervision of the Local Government Board.

In spite of the existence of these great powers, and in spite of the increasing interest which the public are taking in regard to the sanitary conditions under which they live, the fact remains that our towns are in a lamentable state so far as the sanitation of our dwellings is concerned, and surely there is no body of men more capable by their training and experience to help us to the remedy than the Medical Officers of Health, whose duty it is to inquire into the causes, origin, and spread of diseases, with a view specially to protect the public against the dangers of those of an infectious nature.

That the present law has failed to secure reasonably healthy dwellings in our large towns is admitted on all sides, but never more forcibly than last year, when Lord Salisbury's Government introduced the Housing of the Working Classes Bill, with the provision that :—

> Whereas by existing law there is implied a condition on letting a furnished house that it is reasonably fit for human habitation, and it is expedient to extend such implication to the letting of unfurnished houses ; be it therefore enacted that, in any contract for letting for human habitation an unfurnished house, or part of an unfurnished house, there shall be implied a condition that the house is in all respects reasonably fit for such habitation ; and in the event of a breach of such condition as above-mentioned, in the case either of a furnished or unfurnished house, or any part thereof, any inmate of such house who suffers any loss or injury to health or otherwise in consequence of such breach, shall be entitled to recover damages from the person responsible for such breach.

The need of legislation in this direction for the purpose of improving the sanitary condition of our large towns was soon made manifest by the opposition this proposal met with from those large building societies which finance the worst class of speculating builders, and which are thus interested in a vast amount of property—property which it is to be feared is not reasonably fit for human habitation.

The Government gave way to the opposition, and when the Act became law this bold attempt to prevent the adulteration of houses had dwindled down to the following :—

> In any contract made after the passing of this Act for letting for habitation by persons of the working classes a house or part of a house, there shall be implied a condition that the house is at the commencement of the holding in all respects reasonably fit for human habitation. In this section the expression "letting for habitation by persons of the working classes" means the letting for habitation of a house or part of a house at a rent not exceeding in England the sum named as the limit for the composition of rates by Section 3 of the Poor Rate Assessment or Collection Act, 1869, and in Scotland or Ireland 4*l*.

This would seem to suggest that except when let to persons of the "working classes," houses may or may not be reasonably fit for human habitation, and thus it is more than ever necessary that something should be done to remedy the existing state of things.

We protect the citizen from having his coffee adulterated with chicory, yet we allow him to mix his pure coffee with poisoned water, and to drink his beverage in an atmosphere which is charged with sewer gases, thus leaving him in the delusion that in return for rent he is receiving the protection from disease which a house should afford.

The Sanitary Registration of Buildings Bill is a legislative attempt to protect the community against unsanitary dwellings. It is to be brought before the House of Commons early next session by Dr. R. Farquharson, M.P., and may be briefly

ASCHERBERG PIANOS,

THE BEST

FOR TONE, TOUCH, GENERAL FINISH, AND GOOD VALUE.

Wholesale and Retail Depot :—London, 211 Regent Street, W.

The Celebrated "DUBOIS" Hydraulic Drawn Lead TRAPS and BENDS.

The above Shapes and Sizes always in Stock, and we are prepared to furnish SPECIAL SHAPES to order at short notice. These justly celebrated TRAPS are made from Pure Pig Lead by Hydraulic Machinery after the manner of Lead Pipe, and have peculiar advantages appreciated by every Plumber. They are greatly superior to either Cast or Hand-made Traps, as they have no SEAM, are of UNIFORM THICKNESS. PERFECTLY SMOOTH INSIDE AND OUTSIDE, and can be FLANGED, PLUGGED, and STRETCHED, without fear of SPLITTING,. No possibility of Sandholes.

FOR PERFECTION OF MANUFACTURE THESE GOODS ARE PRE-EMINENT.

For Sale generally by the principal Lead Merchants and Wholesale Dealers in Plumbing and Sanitary Appliances throughout Great Britain and Ireland.

DUBOIS MANUFACTURING CO., LONDON AND NEW YORK.

London Office and Works :—15 BRITANNIA STREET, KING'S CROSS, W.C.

described as an effort to secure the maximum advantage with the minimum of officialism.

The principle on which the Bill is based is the same as that on which the Vaccination Acts are administered, viz, the enforcement of a State regulation for the public benefit, while at the same time leaving individual citizens freedom in the matter of carrying out the same.

I hold strongly to the opinion that there is no need for a compulsory inspection of all dwellings by public officers, indeed, I believe that it is not desirable that the sanitary arrangements of our dwellings should invariably be handed over to the tender mercy of a public official.

Apart from the question of the money cost to the community which an official inspection and supervision would involve, I am not prepared to advocate that owners and occupiers of property should be relieved of their proper responsibility, though I am ready to admit that such inspection and supervision might for the moment greatly improve the sanitary condition of our large towns, but, I would ask, at what cost? And here I do not mean at what money cost, but refer to the hindrance to sanitary progress which would result even if the best present system of sanitation were stereotyped in every town in England.

The provisions of the Sanitary Registration of Buildings Bill are very simple. They are :—

1. That the Act shall come into operation in January, 1888, in all towns in England of 50,000 inhabitants and upwards, and in such other districts in the United Kingdom as may choose to adopt it.

2. The authorities entrusted with carrying out the Act are the same as those charged with the administration of the Public Health Acts.

3. Each authority shall appoint a sanitary registrar, whose duty it shall be to issue certificate forms for buildings, such forms to be returned in the same way as the vaccination papers issued on registration of births.

4. These certificates will declare that the buildings to which they refer are in a satisfactory sanitary condition, and shall be signed or sealed by some one of the following persons or corporations, viz. :—

Members of the Royal Institute of British Architects and members of the Institution of Civil Engineers, who are in practice as architects, surveyors, or civil engineers; also architects or civil engineers who have been in practice five years at the passing of this Act and who register their names accordingly with the Local Government Board before January 1, 1888; also by sanitary associations incorporated by license of the Board of Trade; medical officers of health; and medical practitioners qualified in sanitary science; also by the surveyors and engineers of local authorities so far as their own districts are concerned, and such other persons as the Local Government Board may authorise.

5. Where the owner or occupier wishes it, he may call in the services of the surveyor or engineer to the local authority to certify his house, but in that case he is to pay a fee to the local authority for the services rendered. This provision appears to me to be eminently just, unless every householder is to have the professional services of a surveyor or engineer at the public expense.

6. After January 1889 it is to be unlawful for any dwelling-house, school, hotel, hospital, or other building to be occupied unless and until a certificate as described is deposited with the local authority.

7. A penalty is provided in case of the issue of a false certificate, and the wilful issue of a false certificate is made a misdemeanour; penalties are also provided for letting or occupying a house without a certificate.

These are practically the whole provisions of the measure. They almost speak for themselves, and I commend them to the serious consideration of medical officers of health whose great influence I hope will be exerted on their behalf.

All whose opinions are worth consideration recognise the fact that serious imperfections exist in the sanitary arrangements of dwelling-houses, and are alike earnest in their desire to amend them. All are not, however, agreed as to the best means to be adopted to bring about the sanitary reform desired. Some would make it the business of the State to design and regulate the sanitary arrangements of every dwelling-house, though as yet no one has ventured to go so far in the direction of paternal government as to suggest that the State should relieve individuals of their responsibility to be clean and decent in the use of these sanitary arrangements. On the other hand, there are those who think that the State should have no right to inquire into the sanitary condition of any private property, and that it should in no way interfere with those who choose to reside in dwellings of the flimsiest description, with refuse from Covent Garden and Billingsgate for foundations, and drains only cut off from the sewage tanks of Barking, when they cease to fulfil their purpose and become elongated cesspools instead of conduits for the removal of excreta and other house refuse.

BRYANT, POWIS & BRYANT
LIMITED,

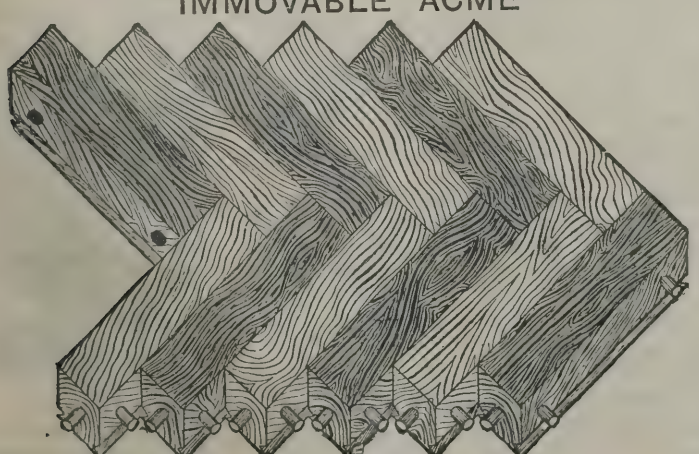
In my opinion these extreme views are a mistake. I think that in this, as in all other matters, the rule of liberty will be found the best preserver of the public well-being, which, correctly understood, includes the well-being of the individual. Where drains and sewers are public property, the responsibility for their proper maintenance admittedly rests in the State, or its representative, the local authority of the district. Any citizen who may be injured in consequence of the unsanitary condition of such public drains or sewers, should, I think, have right of action against any authority through whose neglect the unsanitary condition is proved to have been caused. On the same ground I would urge that in all cases of private drains and sanitary arrangements, the responsibility for their proper maintenance should rest in the owner (or occupier when he stands in the place of the owner), and that the public authority should only have right of action in so far as the condition of the property may be directly injurious to the public health.

That the sanitary arrangements of dwelling-houses should be of one uniform pattern, or that the internal economy of our houses ought to be submitted to the censorship of a public official cannot be desirable—in fact, I feel that we have gone too far in this direction already. In support of this opinion, I venture to relate a recent experience I have had of this desire for uniformity. In a London suburb, not six miles from Charing Cross, I provided the well-known short-flushing rim Hopper closets, with lead traps where connected to soil-pipes, and with stoneware traps where connection could be made direct with the stoneware drain. This short Hopper is admitted to be one of the best forms of closet; so much is this the case that a diagram of it is given in the model by-laws of the Local Government Board. Though the closets I provided thus specially satisfied the requirements of the model by-laws, they did not meet with the approval of the local surveyor, who, by the way, is a very different individual to the district surveyor. My client was building the houses in question to let, he refused to fight the local surveyor, and the short Hoppers, which had been fixed, were removed, and wretched so-called "wash-out" closets substituted. To understand how unsatisfactory this interference may be, I have only to add that, in spite of this insistance on a particular pattern of closet, this local surveyor had no idea of insisting that the house drains should be properly disconnected from the public sewer.

In referring to this case I have no desire to specially blame the local surveyor, who probably first began to study the duties of his office when he entered upon a career to which the united wisdom of his local board thought fit to call him; irrespective altogether of the fact that however intelligent he might be, his past training and experience had in no way fitted him to fulfil the duties which are not easy to those who have been specially instructed in them. Neither must we be too hard on the local board itself. Unfortunately, too few of the better educated members of the community seek to serve it on local boards. No men can give more than their best, and what I wish to suggest is not that the members of our local boards are unworthy public servants, but that they have not the qualifications which might warrant the legislature in handing over to them the right to regulate the internal sanitary arrangements of our homes.



Many sanitary reformers desire to see the law with regard to compulsory sanitation strengthened, and by this they mean that the local authorities should have greater powers given them. In this demand I cannot join, though I would gladly welcome reform which would strengthen the law. At present the powers which the local authorities might exercise are, as I have already pointed out, considerably greater than any local board does exercise with any consistency, and it is this want of consistency in the enforcement of the Public Health Acts which has made them so inoperative. Too much has been attempted, and too little done. Regulations have been made and builders have been told that a variety of things must be attended to, but in too many cases local boards and their officials have been content with framing regulations and giving orders. They have failed in the essential thing, viz., in seeing that builders and others obey.

I would strengthen the law by minimising its demands to essentials, and by insisting on its absolute enforcement. I would increase the responsibility of the individual, but in so far as the public authorities pretend to interfere I would make it a real interference, and in every case where the law was not complied with there should be some punishment meted out to those responsible for the breach.

The Sanitary Registration of Buildings Bill does not, however, make any attempt in the direction of the very important work of amending and modifying existing sanitary laws. The Bill only deals with the one question of sanitary registration, and asks that it should not be lawful for any building to be occupied until it is certified as reasonably fit for habitation. This is a principle which I feel sure will meet with the approval of the Society of Medical Officers of Health, and I trust, therefore, that your support will be given to the Bill.

BRADSHAW'S LIMMER ASPHALTE

Messrs. BRADSHAW & CO., being Sole Agents in the United Kingdom for, and possessing proprietary rights in, the Freehold Mines of the German Asphalte Company (of which Mr. C. W. Bradshaw is also a Director), situated at Limmer, near Hanover, and Vorwohle, Brunswick, possess special facilities for reliable and prompt delivery of their celebrated "LIMMER ASPHALTE" at low rates, either for sale in its natural state or ready for laying by their own workmen in any part of the United Kingdom. EACH BLOCK supplied from these Mines, besides bearing the impress of the Company, is stamped with the words "BRADSHAW & CO." The attention of Architects, Engineers, &c., is particularly called to the fact that the "LIMMER ASPHALTE" is especially suitable for use in the construction of Reservoirs, Roofs, &c., where water-tightness is extremely essential. For such purposes **Over 2,000,000 (Two Millions) of Square Feet of "Limmer Asphalte"** have been executed by Messrs. BRADSHAW & CO.; while for Paving purposes **Over 50 Miles of "Limmer Asphalte" Footways** have been laid by them in the LONDON DISTRICT ALONE. Messrs. BRADSHAW & CO. will be happy to forward Prices, Samples, and Testimonials, and give all information on application to:—

R. ADAMS,

17 BLACKMAN STREET & 7 GREAT DOVER STREET, LONDON, S.E.,

INVENTOR and PATENTEE of the

SAFETY WINDOW WITH REVERSIBLE SASHES

FOR INEXPENSIVE AND PERPETUAL CLEANLINESS,

Which has gained at the INTERNATIONAL HEALTH and SANITARY EXHIBITIONS

Two Gold, Four Silver, and Four Bronze Medals, and Sixteen Diplomas of Merit.

IMPORTANT NOTICE.

The Patentee has been advised by several of his friends to form a Company for the Manufacture of the above-mentioned Sashes in larger numbers, for the supply of the Trade and for the Home, Colonial, and Foreign Markets. Hitherto he has only supplied the Fittings, except under very special circumstances. He now proposes to manufacture the Sashes complete with Fittings.

Provisional Protection has just been granted for another Patent, whereby the Sashes will be greatly reduced in price, and, consequently, brought within the requirements of every Architect and Builder.

If any of the readers of this journal wish to receive further particulars or to take Shares in the proposed Company, they are requested to make early application to the Patentee, as it is expected that the larger number of the Shares will be privately subscribed.

Applications for Shares will be taken in the order in which they are received.

THE CORSHAM BATH STONE CO. (LIMITED) CORSHAM.
BATH STONE. | Summer Dried. Corsham, Combe, Box Ground, Westwood, Farleigh. | Prices on application
LONDON DEPOT:—S.W. RY., RIVERSIDE, NINE ELMS.

FLAT BRICK FIRE-PROOF FLOORS.

LONDON, 1874.

LONGITUDINAL SECTION.

BRUSSELS, 1876.

THE BEST as well as the CHEAPEST Fire-proof Floors yet introduced. Their small cost makes them specially suitable for artisans dwellings, residential flats, offices, chambers, and private houses.

They are constructed with hard-burnt bricks, laid flat, and bonded on the upper face with tough concrete 3 inches thick; and by the method of laying all iron is protected from the action of fire.

Experiments show a resistance to load and impact greater than furnished by the ordinary concrete floors. No thrust is transmitted to the walls, as in all arched construction, the walls being tied in and strengthened.

The floors are practically noiseless, the different densities of the concrete, brick and plaster, with the air space above, intercepting the sound vibrations.

The brick soffit forms a capital key for the plaster, and no laths or counterceiling are necessary, but for high-class work wood blocks are introduced in the soffit, to which the ordinary lath and plastering or fibrous plaster is fixed This also provides a second air space, and furnishes the most perfect sound-resisting floors known.

They are not affected by water, acids, or alkalies, and they may be fixed during the progress of the building, thus dispensing with the use of internal scaffolding.

The concrete being tough instead of friable, the boarded finish may be nailed down without the use of sleeper joists. It is recommended to use an inch strip as a sleeper fillet. This will provide ventilation, and space for gas and water-pipes.

The depth of the finished floor is 6 to 9 inches only, and when the saving on this head is taken into account, the cost does not exceed that of the ordinary combustible timber floor of corresponding strength.

HOMAN & RODGERS,

PATENT SECRET BALANCE.
See "The Architect" of October 22, 1886, page 9.
Particulars free on application.
H. T. TALLACK, 28 Hatton Garden, London, E.C.

GRUNDY'S PATENT WARM-AIR VENTILATING FIRE GRATE.
The novelty, superiority, and advantage of this patent consist in the heating surface being greater than any other Fire-grate introduced to the public. It is very simple in construction, and is made in the form of a Stove, the back of which is semicircular in shape, with gills behind and smoke-nozzle on top, all cast in one piece. The same can be attached to any design of a Register or Stove front. It is very suitable for schools, class-rooms, waiting-rooms, hospitals, offices, dormitories, and dwelling-houses, from the cottage to the mansion. Design and specification post free on application.
TESTIMONIALS.
"9 Victoria Chambers, Westminster, S.W.: June 10, 1884.
"SIR,—I have much pleasure in testifying to the efficiency of your patent warm-air fire grate. It has been very successful, and given every satisfaction where I have used it. Yours, &c.,
"To Mr. Grundy. JAMES WEIR, F.R.I.B.A."
"6 John Street, Bedford Row, W.C.:
"December 16, 1885.
"DEAR SIR,—I have now had an opportunity of testing your patent grate, and am glad to be able to say that I am most agreeably disappointed, because, as you are aware, I was rather sceptical about its powers when you showed it to me; but now I can say it answers admirably, and heats abundantly my porch-conservatory.—I am, yours truly,
"R. S. LANDER, F.R.I.B.A.
"To Mr. John Grundy."
From James Garry, Esq., Architect, West Hartlepool, July 1884.
"DEAR SIR,—I have very great pleasure in stating that the first stove, or patent warm-air ventilating fire grate, adopted by me in school at Seaton, and a second in a Cocoa Palace, have given such satisfaction that I now order eleven to be inserted in New Upper Grade Schools in course of erection at West Hartlepool. They are the most economical, efficient, and easily managed stove at present before the public.—Mr. John Grundy."
From Hon. and Rev. G. G. C. Talbot, M.A., Withington, Cheltenham.
"DEAR SIR,—You will be gratified to hear that the school is completely warmed by your new grate. It is the most economical and efficient that I have ever seen.—Mr. John Grundy."
Society of Architects, Architectural and Building Trades Exhibition, 1885:—"5 Great James Street, Bedford Row, May 1.—The warm-air ventilating grate shown by Mr. John Grundy at Stand 75 Floral Hall, is an admirable contrivance for utilising the heat conducted through the back and sides of the stove, for warming schools and buildings by a supply of freshly warmed external air."
Apply to JOHN GRUNDY, 30 Duncan Terrace, City Road London.—Works: TYLDESLEY, near Manchester.
Agent for Scotland, SEPTIMUS HARPUR SMITH, 1 Upper Gilmo Place, Edinburgh.

IMPORTANT.—To Specialists, Manufacturers, and Others.

Effective Advertising at a Minimum Cost. Now in preparation for Publication in January. Demy 4to, Illustrated.

THE ARCHITECT AND CONTRACTOR'S COMPENDIUM

And Specialist's Directory for 1887.

EDITED BY JOHN E. SEARS, A.R.I.B.A., F.A.S.

An illustrated and priced catalogue and directory of specialities, manufactures, and requirements in every branch of the Building Trade, and in office and workshop, carefully classified and indexed, combined with an Office Diary, Legal and General Information, Copies of Building Acts and By-Laws, Tables, and Memoranda. Illustrations may be inserted produced by the Litho- or Ink-Photo process. In addition to the usual circulation of a first-class Annual, **the Publishers guarantee to send a copy gratuitously to every Architect and Builder whose name appears in the London Directory.** Advertisements will thus for twelve months be in a convenient and attractive form before the eyes of the people Advertisers specially desire to reach, and this **at a cost less than half that of sending out one circular.**

The minimum **guaranteed circulation** of the **Compendium** is 3,000 copies, but the actual circulation will probably reach a much higher figure.

Special attention is directed to the fact that, at great expense, the Publishers have arranged to illustrate this work by the magnificent **Ink-Photo** process, specimens of which are to be seen weekly in *The Architect*. The **Compendium** will thus be far ahead as an artistic production of any class Annual published, adding greatly to its value as an advertising medium. The Ink-Photos can be produced, **without block**, from **any** drawing or photograph, and printed in any tint. The charges are very moderate, and will be quoted on application.

An exceptional opportunity is thus afforded Country and Colonial Firms to introduce their manufactures to the London market. The Compendium will be produced in first-class style, and will doubtless become a standard work of the trade.

Prospectus, with full table of contents, &c., free on application; but Advertisements and Blocks should be forwarded at once to the Advertisement Manager, 16 New Bridge Street, London, E.C.

TRADE NOTES.

MESSRS. WHEATLEY KIRK, PRICE & GOULTY will, on December 7, 8, and 9, sell by auction the valuable modern machinery and entire contents of the Alliance Engineering Works, at West Drayton, near Uxbridge, Middlesex, comprising the fixed and loose plant, finished brickmaking machinery and tools, stock, stores, &c. The leasehold premises are for disposal, and may be either purchased outright or rented on lease. The premises comprise over one acre of land subject to an annual ground rent of 33*l.*, and held for an unexpired term of thirty-two years. This includes the free use of the canal dock. Erected thereon are:—Substantial machine shop, 110 feet by 35 feet wide; foundries, smithy, pattern shop and stores offices, &c. The premises are held under two separate leases, which can be inspected at any time upon applying to the auctioneers. The situation is a very desirable one for residential purposes, and its proximity to London, together with favourable canal and railway communication, point it out as an economical and admirable place for any firm doing a London trade. Particulars may be obtained from Messrs Wheatley Kirk, Price & Goulty, 52 Queen Victoria Street London, E.C., or Albert Square, Manchester.

REDISCOVERY OF NUMIDIAN MARBLE.

ALL traces of the Numidian marble quarries were lost during the decline of the Roman empire, and lately rediscovered. These magnificent marbles are now coming into extensive use. It may, therefore, possibly interest our readers to have a short account of them, their different varieties, and a list of the buildings in ancient Rome in which they have been employed. This is derived from the report of the British Consul at Algiers, Colonel R. L. Playfair, as it is at once authoritative, exhaustive, and most interesting, supplementing it with some more recent details. Thirty-four kilomètres north-east of Oran, on the high road to the port of Argan, is the small village of Mefessour; a branch road to the north-west leads (two kilomètres) to the still smaller village of Kléber. Above this rises the imposing mountain called Djebel Oronsse on the maps, a corruption no doubt of Djebel Er-Roos, "Mountain of the Capes," but generally called by the colonists "Montagne Grise," from its arid, grey appearance. This chain of hills, the highest point of which is about 2,000 feet above the sea, stretches in a north-easterly direction from Cape Aiguillo on the west to Cape Carbon on the east, and includes Cape Ferrat, nearer to the latter than to the former. These have no doubt given the mountain its Arabic name. The central part of the range forms an elevated plateau, almost perfectly level, with a superficies of 1,500 or 2,000 acres; it has hardly any soil or vegetation—nothing, in fact, to hide from the most superficial observer that it is an uninterrupted mass of marble and breccia, the largest and the finest, perhaps that the world contains. This is, indeed, none other than the celebrated Marmor Numidicum, so highly prized in ancient Rome. These immense quarries were the exclusive appanage of the Roman emperors, and their actual locality was kept a profound secret by the massacre of the slaves employed to extract the marbles, and at last was entirely lost sight of in the troubles which followed in the decline and fall of the Roman empire. The name implies that it was found in North Africa, but it is also misleading, and, till the discovery of Signor del Monte, some were tempted to search for it rather within the limits of the ancient Numidia than in this remote corner of Mauritania Setefensis. Signor del Monte belongs to a family which has for generations been employed in the extraction of marble at Carrara. Being without fortune, he came to Algeria in his youth, shortly after the conquest of that country by the French. Signor del Monte has obtained a concession of this mountain for a long series of years, and on very favourable terms, and in addition to his freehold he has also obtained all the land round about in which there is any chance of marble being found, so that the entire acquisition amounts to 14,000 acres, and this avoids the possibility of competition. The whole of this immense area is one uninterrupted mass of marble and breccia. All over the surface may be seen depressions, showing where the ancients have been at work, thus marking the sites of the Roman quarries, and these to a great extent indicate the position of the different varieties.

ART IN TEXTILE DESIGN.

A SERIES of lectures arranged by the Textile Industries Committee of the Yorkshire College on "Art in Design," was begun on Wednesday in the chemical theatre of the college, by Mr. Lewis F. Day, Cantor Lecturer to the Society of Arts. The subject was "The Anatomy of Pattern," and those which are to follow deal with the distribution of ornamental design, the fitness of ornament, and the study of design. The series has been arranged with the object of extending a knowledge of fine art among the students of the weaving and designing school, in connection with which classes for drawing are also to be established. Mr. Day's lectures come as an introduction to the course.

Mr. Day said that pattern came of repetition. Many a pattern bore on the very face of it evidence that it had grown out of the necessity of repetition. They saw this very plainly in the chequer, which was the product of plaiting; in the lozenge or diamond pattern, which was anticipated in the meshes of the simplest form of netting; in the herring-bone or zigzag, which was derived from basket-work. Even the elaborate interlacing ornament of Arab art was based upon an arrangement of cross lines very much as might be seen in the common cane-bottom chair. It was more than probable that some mechanical necessity gave rise to all geometric pattern. Certainly it was impossible to plait, net, knit, weave, or otherwise mechanically make without producing pattern. It might be so

LOFTS' PATENT STOVES

Will burn any kind of Coal or Rubbish, consume their own Smoke, and require only one-fifth the Fuel of any other Stove.

After four years of tedious experiments I have been able to produce what has long been required, viz., Domestic Stoves which consume only one-fifth the quantity of Coal (*One Ton instead of Five*) required by any ordinary stove, at the same time giving as great an amount of heat and more thorough ventilation. I have great confidence in recommending these to the public. Since perfecting them I have tried them for six months in the worst of smoky chimneys, and they have not failed in any one case; have shown them at work to a large number of scientific, medical, and practical men, and they have given but one opinion, which is that, as regards heat, health, and comfort, they are perfection, and they have not seen or heard of anything to equal them. The fire-grate is perfectly open, like the register or slow-combustion stoves now in use; they are neat, strong, and easy to understand; will burn any kind of coal or rubbish; **consume their own smoke**; are lighted just in the same way as an ordinary stove, and draw up as quickly and as easily.

Full particulars on application.

To be seen in action at London Show-rooms, 165 Queen Victoria St., E.C., or at Cambridge

small, as it often was in weaving, that the warp and the weft were invisible to the naked eye, but it was there, and all that remained was to efface it as much as possible, and to make the best of it. Out of the determination to make the best of it had grown much of the most beautiful pattern work. To neglect this course of inspiration, therefore, to say nothing of the attempt to suppress it, would seem to be wasteful to the last degree. The very repetition of parts produced pattern, so much so that wherever there was ordered repetition there was pattern. Any form repeated at regular intervals produced a pattern as surely as the recurrence of sounds would create rhythm or cadence. The distribution of the parts need not be regular. The wave marks on the sand, the veins of marble, the grain of wood, the crystallisation of the breath on the window pane, the very features of the human face resolved themselves into pattern.

There was room for speculation whether, with a view of escaping this danger, or anticipating it rather, the designer first took to the deliberate use of those masks and grotesque heads which form so prominent a feature in ornamental design. The popular idea of the process of ornamental design was that the artist had only to sit down before a piece of paper, and, spider-like, spin out the fancies that might crowd his fertile imagination. Indeed, there was scope in design for all his fancy; but he was no Zeus that ornament should spring, Minerva-like, full-grown from his brain.

Ornament was patiently built up on lines inevitable to its consistency—lines so simple that to the expert it was not difficult to lay bare its very skeleton, and to classify the pattern work according to its structure; to show affinity between groups to all appearance dissimilar, and, indeed, to point out how few were the varieties of skeleton upon which all the variety of effect was framed. For a man to make a repeating pattern without regard to its logical construction—as though in his domain there should be no skeletons—would be, from his (the lecturer's) point of view, a profoundly foolish thing; but, more than that, it was impossible. He might design a unit in which there was no repetition and no formality, but, the moment he repeated the unit, the very order of its repetition proved to be the cupboard, if he might say so, in which the skeleton would be found. It might be imagined that by designing in some such haphazard fashion the artist would secure to his design a freedom of line and an absence of formality not readily obtained by adopting the more systematic method; but this was not by any means so. If a design were above the level of insignificance, there must be in it some dominant feature, which, when many times repeated, would appear more prominent than ever. It was to these features that the eye would be irresistibly drawn; it was the lines they took in relation one to another which would assert themselves. If lines had not been taken into consideration, it was not to be expected that they should come out satisfactorily, and as a matter of experience they always came out awry. All must have suffered more or less from wall-paper and other patterns in which certain ill-defined but awkward stripes impressed themselves upon them, and they might have imagined that this effect of stripes came from working upon vertical, horizontal, or diagonal lines. But it was much more likely the result of not working upon definite lines at all. A designer who knew his business would make sure of lines not in themselves offensive, and would also counteract a tendency to stripes in one direction by features diverting the attention otherwards, and would so clothe any doubtful line that there would be no fear of it asserting itself, as in its nakedness it might—he saw the danger, and was forewarned against it. The mighty man of valour who disdained to be trammelled by any such incumbrance was without defence against contingencies practically certain to arrive. The overwhelming odds were that the petty considerations he had despised would be quite enough to wreck any venture he had dared in defiance of them.

Since, then, it was practically inevitable that there should be definite lines in ornamental design, seeing that if they did not arrange for them they arranged themselves, it was the merest common sense to lay down those lines to begin with, and, in fact, to make them the skeleton or framework upon which they built up their pattern. The lecturer then proceeded to "dissect" certain designs shown, and explained the extensive use to which certain lines might by modification and variety be put, and in the course of his observations said that probably the vast order of patterns constructed upon cross-lines was the first in point of time, as it arose inevitably out of the very primitive art of plaiting. They had not done away with construction when they had succeeded in keeping the scaffolding out of sight. It was the equilateral triangle which was the most useful factor in design. Once they had the equilateral triangle they had only to group the units to get the hexagon (a group of six triangles), the star (a group of twelve), and other shapes. Their scope was thus immensely widened, they having the basis of an infinity of geometric patterns, such as were found in Byzantine mosaic work and in

FOR TONE, TOUCH, GENERAL FINISH, AND GOOD VALUE.

Wholesale and Retail Depot :—London, 211 Regent Street, W.

The Celebrated "DUBOIS" Hydraulic Drawn Lead TRAPS and BENDS.

The above Shapes and Sizes always in Stock, and we are prepared to furnish SPECIAL SHAPES to order at short notice. These justly celebrated TRAPS are made from Pure Pig Lead by Hydraulic Machinery after the manner of Lead Pipe, and have peculiar advantages appreciated by every Plumber. They are greatly superior to either Cast or Hand-made Traps, as they have no SEAM, are of UNIFORM THICKNESS. PERFECTLY SMOOTH INSIDE AND OUTSIDE, and can be FLANGED, PLUGGED, and STRETCHED, without fear of SPLITTING, No possibility of Sandholes.

FOR PERFECTION OF MANUFACTURE THESE GOODS ARE PRE-EMINENT.

For Sale generally by the principal Lead Merchants and Wholesale Dealers in Plumbing and Sanitary Appliances throughout Great Britain and Ireland.

DUBOIS MANUFACTURING CO., LONDON AND NEW YORK.

London Office and Works :—15 BRITANNIA STREET, KING'S CROSS, W.C.

its Moresque derivatives. The octagon was not a unit which would of itself form a diaper, as the hexagon would; it was only in connection with the square, diamond, or other four-sided figure that it would repeat. Nevertheless, this new series gave varieties of radiated patterns, as witness the elaborate interlacings of the Arabs, all of which, even the most magnificent, were closely related to the seat of a common cane-bottomed chair. In certain Arab patterns where this ultra-elaboration of lines was employed, it appeared almost as if a new principle had been introduced, but upon analysis the designs resolved themselves into the elements already referred to. Pentagons formed a very respectable diaper, especially if enriched with five-pointed stars. Shapes of any kind might be put together to form a pattern, but the lines on which they were arranged or into which they faced must be those laid down, which were, indeed, the basis of all possible pattern.

For further variety in design they must resort to the circle, but it, however, must be struck from centres corresponding to the points of intersection of lines such as had been described; and in so far it was only one of the innumerable arbitrary shapes that must be so arranged. Whether the idea of flowing forms first grew out of the circle was of no great consequence. It was more than probable than instinct preceded geometric principles. Many of the common flowing patterns might be deduced from angular motives. However, the circle was familiar to man from the moment he first saw the sun or moon as discs in the sky, and the first pattern traced by man's hand may have consisted of circles. The circle with its segment, the curve and its compound the spiral, assumed extreme importance when they came to the consideration of the scroll. Having shown how the combination of straight lines and curves would do so much for the designer, he said that the Japanese sometimes went so far as to interrupt the pattern, wiping out a bit here and there, and thus anticipating the softening effect that age might impart. The basis of all repeated patterns was geometric, and it was therefore essential that the designer should be acquainted with simple geometric principles, as it was that a figure draughtsman should have some knowledge of superficial anatomy. The designer had not merely to invent pretty patterns, but such as could be conveniently worked. The lines mapped out for him by the conditions of his work were in most instances not just those which beauty had decreed. It was very unsafe to dogmatise as to the origin of a pattern, as there were always so many ways in which it might have been suggested. All things considered, the most useful skeleton to work upon was the diamond. It was on the basis of the diamond that "drop" patterns were most readily designed. The "drop" was a design by means of which the designer was enabled without reducing the scale of his work to minimise the danger of unforeseen horizontal stripes, a danger which was imminent when repeats occurred always side by side on the same level. It was only by experience that a designer learned to know what might or might not be done within given lines. Many a notion turned out to be practically quite unamenable to the conditions under which the craftsman worked. Yet there was relief in the very variety of the efforts expected, and in the presence of difficulties ingenuity was excited. A designer must have pugnacity and enjoy tackling a tough problem. A man proved himself a designer, not because he had somehow arrived at a design, but inasmuch as out of unpromising material and untoward circumstances he could shape a thing of beauty.

THE LIVERPOOL EXHIBITION.

A REPORT on the late Liverpool Exhibition has been sent to the guarantors from the executive council. According to it the total amount received from all sources was 131,000*l.* It is anticipated that the deficit will be over 15,000*l.*, exclusive of certain contingent claims from building contractors. The chief causes of so large a deficit are ascribed to the unexpectedly increased cost of dealing with the difficulties of the site and in the important fact that the area of the building was enlarged, by the addition of the machinery annexe and the concert-room, from about 32,000 square yards, as at first intended, to nearly 47,000. There was further much additional expense caused by the great delay in the work of levelling the land, undertaken by the Corporation, and numerous details of expenditure brought about by the extended character of the Exhibition. In spite of the want of financial success, the executive council consider that the results of the Exhibition, as such, have been so satisfactory that it would be a matter of regret to entirely abandon the building, and they therefore requested the honorary secretaries, in conjunction with Mr. G. Gordon Hake, the general superintendent, to prepare a report embodying a scheme for another Exhibition, if it should be determined to hold one. This report shows that instead of a capital expenditure of

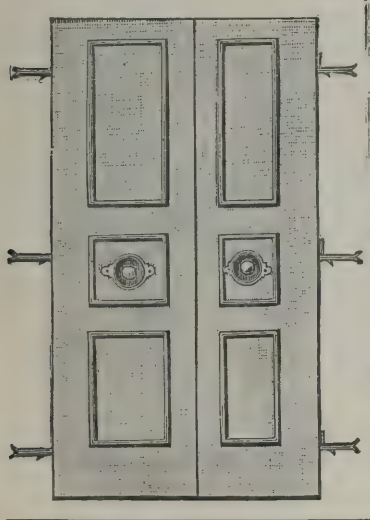
86,000*l.*, incurred this year, it would probably not be necessary to spend more than 25,000*l.* at the most on the same account another year. The honorary secretaries and superintendent in their report recommend the holding of an Exhibition for two reasons, viz., in order to take advantage of the capital expenditure already incurred, and in order to provide means for celebrating the Jubilee year in Liverpool. It is, therefore, proposed to make the Exhibition at once local and imperial.

Among the features contemplated are a collection illustrative of engineering and mechanical science since Her Majesty's accession, as applied to practical purposes, laying down as a principle that the exhibits would be typical ones, and affording to exhibitors such accommodation in the way of space as they have not been able to obtain in former exhibitions, the object being to secure a comparatively small number of really representative exhibits rather than a great number of small ones. It is also proposed to have an Emigration Court, in order to introduce colonial works, and another illustrative of war.

To impart a local character, it is suggested that a large section might be appropriated to Liverpool tradesmen. Special character might possibly be given to this section by constructing a street inside the building, the houses in which might illustrate the progress of street architecture in Queen Victoria's reign, while the shops below would be available for ordinary business purposes. In view of the fact that the remainder of the Exhibition would be made up of loan collections, the result would be that no other sales whatever would be made, and this rule should be absolutely adhered to. By these means, the objection to the Exhibition on the ground of encouragement given to dealers from abroad and from a distance, to the prejudice of local tradesmen, would be entirely removed.

There should be no foreign section whatever. In its stead there might be a section devoted to Lancashire relics, illustrative of the history and archæology of the county. There are rich stores from which to draw such a collection, never yet, we believe, brought together.

It is proposed to erect an old Lancashire village against the three sides of the building in the lower gardens, consisting of typical reproductions taken from the old towns and villages in the county, the whole of the centre space being laid out so as to form a broad promenade, in the centre of which would be reproductions of two old market-places. The letting of shops in the old village to Liverpool tradesmen would more an cover the cost of the erection, and it would be proposed to sell nothing in them except fruits, ices, flowers, and suitable merchandise.



The gardens would be improved, and the latest arrangements introduced for the display of the electric light and fountains. The committee consider that the Exhibition would not interfere with the one to be held in Manchester. A *pro forma* balance-sheet of the contemplated Exhibition is made out, in which the receipts are put down at 134,773*l.*, and the outlay and contingencies at 80,300*l.*, leaving an estimated surplus of 54,473*l.*

The principal guarantors appear to be favourable to the proposed Exhibition, but as there are over eight hundred to be consulted some days must elapse before there is a decision. Mr. Ellis Lever, of Manchester, has offered to become a guarantor to the extent of 1,000*l.*, provided a section is reserved for exhibits of every kind of invention, appliance, and apparatus having for their object the prevention of accidents and the saving of human life on land or water and in mines.

At the meeting of the Liverpool Town Council on Tuesday, the Council, however, decided to inform the guarantors that they cannot assent to the holding of another Exhibition.

THE ROYAL ALBERT HALL.

A SPECIAL meeting of the Royal Albert Hall Corporation was held in the west theatre of the hall on Tuesday, to consider the draft of the supplemental charter for which an application is to be made to Her Majesty. Mr. H. C. Rothery presided, and there was a large attendance. The Chairman stated that until the previous night he had been under the impression that there was to be strong opposition to the supplemental charter. Their annual income at present was only 1,500*l.*, while 5,500*l.* was required for the ordinary expenses, the difference of these two sums being obtained by the seat rate (2*l.* per seat). There were no funds with which to meet any extraordinary expenses, and the stringency of the existing charter prevented the Council from accepting offers which would provide them with funds and enable them to do all that they wanted to do for the corporation and the seatholders. The changes proposed by the Council were therefore necessary. By the courtesy of Mr. Murdoch and Colonel Prendergast he had become acquainted with the general tenour of their amendments. Having carefully looked into them, he thought they contained scarcely anything which the Council would not accept. They thought it

In the transaction of speculative business Messrs. C., S. & Co. make no charge for commission or brokerage whatever unless their client makes a profit, when they take 5 per cent. of the profit made as their remuneration.

All transactions advised by wire as soon as completed. Monthly Circulars and Mining Reports post-free on application.

COLES, STEWART & CO., St. Stephen's Chambers, LONDON, E.C.

undesirable to go into the history of the seat rate, no new powers being asked for in the supplemental charter in connection with that matter. The next amendment was on the 9th clause, which related to the acquisition by the Corporation of land belonging to the Commissioners for the Exhibition of 1851, and of the conservatory and other buildings thereon, and provided that the hall and premises might be appropriated to public and private meetings, theatrical entertainments, concerts, balls, or any other entertainments for the amusement and recreation of the people, and any other similar use approved by the Council and assented to by the president. Objection was taken to the introduction of the word "theatrical." It seemed to be thought that the Council were going to convert the Albert Hall into a theatre, but it was only proposed to adapt the two small theatres for such purposes. By the next amendment it was proposed to omit subsection 3 of clause 10. That clause authorised the Council—(1) to let the hall and premises for any of the purposes sanctioned by the proposed charter; (2) to arrange with individual members of the corporation for the exchange, purchase, renting, or temporary user of their boxes or seats; and (3) to make arrangements for the application of profits arising from the hall, &c. The Council were disposed to concur in the objection to the last section that it savoured too much of speculation. What, however, they wanted was simply to have the power of applying any money resulting from the extended use of the hall and premises towards embellishing them. Clause 11 provided that the corporation in general meeting, might, by resolution, empower the Council to exclude the members of the corporation for a number of days not exceeding ten in any one year from the hall and premises when used for private meetings or entertainments. He did not understand that the clause was objected to, but that further explanation was required. Well, they could not ask any one to hire the hall for a large sum of money, say for a supper or a ball, if there was the risk of 600 or 700 persons coming in to participate in either free. The Council therefore asked for the power to exclude the seatholders on those special occasions. He concluded by moving a resolution for agreeing to the draft charter, and giving effect to the amendments mentioned.

A protracted discussion followed, in the course of which Mr. Murdoch said he thought an effort might be made to reduce the expenses. The hall would certainly be made more popular, but the confidence of the seatholders had been greatly shaken by the action of one of the members of the Council, if not more, it having been suggested that the place might be turned into a music-hall, with drinking bars all over the place. With regard to letting the hall for balls, great care would have to be exercised by the Council as to the character of the balls.

Colonel Prendergast strongly dissented to the place being used for any of the purposes of a music-hall.

The Chairman said that the Council had never had any such idea.

Ultimately, the clauses of the charter having been dealt with *seriatim*, and various amendments discussed, clause 9 was amended by prohibiting any part of the premises from being let for political meetings or the large hall for theatrical representations, and clause 10 was amended by striking out sub-section 3. The draft charter was then approved, with a few dissentients.

EXPORT DUTIES ON TIMBER IN FINLAND.

THE following modifications, according to the *Moniteur Belge* of October 18 last, have been introduced into the Customs regulations and tariff of Finland:—

By a decree of June 19 last, customs dues levied upon the export of sawn wood have also been applied to the following articles, and will remain in force until the end of the year 1890:—

Planks, joists, battens, and other sawn wood at least 6 feet in length, $1\frac{1}{5}$ penni per Finnish cubic foot, or, if the exportation consists of a full cargo, 1 marc per ton register.

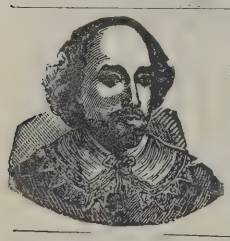
Sawn pieces of wood of a length not exceeding 6 feet, $\frac{1}{2}$ penni per cubic foot, or, if the exportation is by sea, 50 pennis per ton register for complete cargoes.

The following timber will continue to be free from duty:—

Firewood and other timber simply sawn.

Splints which do not exceed 3 inches in width and 2 inches in thickness.

Pieces of planks and joists not exceeding 2 feet in length.



Beams, sawn blocks, wood for building, poles, and other common wood, at least 6 feet in length, $1\frac{1}{5}$ penni per cubic foot, and other similar wood, at least 6 feet in length, $\frac{1}{2}$ penni per cubic foot.

Telegraph poles, sleepers, lathwood, pit-props, hand-levers, hand-spikes, &c., are to be free of duty.

For squared wood the cubic contents will be calculated

according to the mean length, breadth, and thickness, and for rounded wood the length and the diameter of the cut end, including the bark. If there is any difficulty resulting from the adoption of such a method of calculation, the dues must be charged and collected according to the measurement given by the exporter and confirmed by the bill of lading.

THE WENHAM COMPANY.

THE WENHAM COMPANY, Limited, have just issued a revised complete catalogue or illustrated price list of the Wenham patent lamps. These lamps have for their object the production of a pure, brilliant, and economic light by a new system of burning coal gas, in which the illuminating power is enormously increased without the aid of enriching materials. Another noteworthy advantage is that the Wenham lamp sheds its light all around and downwards, unobstructedly, the flame being below all opaque fittings. The principal advantages of the Wenham system, summed up, are :—Great economy in consumption of gas, great purity, intensity and steadiness of light, absence of downward shadow, security against fires, being recommended by insurance companies, and, lastly, they can be used as ventilating lights. As to economy in consumption of gas, it is needless to say that gas bills are no trifling part of the yearly expenditure, and anything that will lessen this expense is a great boon ; and this is the more acceptable seeing that so brilliant an increase of light accompanies the decrease in consumption of gas, or, in other words, the lessened amount of the gas bill. In the testimonials selected as examples of many received by the company, the writers, who have the Wenham lamps in use, note with satisfaction the excellence of the light and the great economy in consumption of gas ; and at the Duval restaurant of Messrs. Spiers & Pond, where the Wenham lamps have been substituted for electric light, the secretary, Mr. A. M. Lloyd, writes that by the adoption of the Wenham patent ventilating gas lamps in place of the electric light, they have obtained as good a light at a greatly reduced cost, and have also improved the ventilation. Further, as to consumption and illumination, there are the tests by Professor Foster, M.A., &c., Lecturer on Chemistry and Physics at Middlesex Hospital, formerly Gas Examiner to the Metropolitan Board of Works, and by Dr. Wallace, Ph.D., &c., Gas Examiner to the City of Glasgow, which are given in detail.

No comment is required on such advantages as are derived from the absence of downcast shadows and from security afforded from fire risks. Anything will be welcomed that will prove a safeguard against the risks incidental to systems of lighting. As to the advantage of the gas lamps in regard of ventilation, and as to the deleterious effects of ordinary gas-lighting on health, also to property, through damage to decoration, works of art, &c.—hardly too much can be said. Gas-lighting, there can be no doubt, is most undesirable unless the products of combustion are eliminated, and absolute immunity from a most insanitary and destructive evil secured. Furthermore, the elimination of these injurious products will also set in action a system of ventilation that necessarily insures a sweet and healthy atmosphere by carrying off all vitiated air.

Before examining in detail the long list of lamps in various styles and differences in detail, which fit them for all uses, from what may be called everyday purposes up to the larger and more elaborate requirements, one or two examples may be described as typical of the system forming the distinctive features of the patent gas lamps. Thus the Wenham patent ventilating gas lamps are designed to secure a pure atmosphere without heat or smoke, with a brilliant light superseding those of sun-burners, and keeping the upper stratum of air below the ceiling as pure as in any other part of the room. A No. 1 lamp, consuming from 6 feet to 8 feet of gas per hour, will efficiently light a room 15 feet by 15 feet; No. 2, from 9 feet to 11 feet of gas, a room 20 feet by 20 feet ; No. 3, from 12 feet to 14 feet of gas, a room 24 feet by 24 feet ; and No. 4, using from 20 feet to 24 feet of gas, one of 30 feet by 30 feet. The following is descriptive of the section on next page :—

A is an iron ceiling box to fix between the joists. B is the exit pipe or chimney of lamp delivering the products of combustion into the iron box A. D is gas supply. C is a flue pipe made of sheet iron leading into a chimney or vertical shaft. E is a packing of non-conducting material to prevent any radiation of heat from the pipe or box (silicate cotton answers the purpose well, and is easily applied). By this system only a single flue pipe need be used, which can be fixed at a small cost.

If it is not practicable to get a pipe from centre of ceiling into a chimney owing to the joists crossing, a pipe may be conveyed under the ceiling and covered by an ornamental zinc moulding, a "dummy" moulding on the other side being added for the sake of symmetry, if desired.

All the ventilating lamps are made with separate supply for

a flash jet or pilot light, the advantage of which is that great economy is gained, and the lamp is always ready for use, as the flash jet is intended to be left constantly alight, the consumption of gas for which is infinitesimal. In fixing ventilating lamps it is necessary to arrange a flue pipe leading from the ceiling box into a chimney, or a vertical shaft in which there is a good up current. A gas supply pipe, fitted with adjustable

patent tap and regulator to each lamp. A $\frac{1}{8}$ iron or $\frac{3}{8}$ copper supply to the flash jet, with tap to adjust the proper quantity of gas. The flame of the flash jet should never exceed $\frac{1}{2}$ inch in length. To adjust the screw in plug of patent tap leading to the burner, so as to give the proper size of flame; and where several lamps are placed in one building and a regulator is fixed on the gas service, it is important that each lamp is properly adjusted so as to get the exact quantity of gas. This is done by regulating the screw in plug of patent tap, which should be fitted to each lamp; the space between the flue pipe, heat box and woodwork must be filled in with silicate cotton or other non-conducting packing material, to prevent any radiation of heat from the pipe or box, and, if preferred, double or treble iron outer casings can be used.

A variety of these lamps, as shown in the catalogue, are in use at the Jockey and West End clubs, mansions, libraries, &c., one of which we illustrate.

Another typical application of the Wenham system is seen in the variety of patent Wenham lamps designed for the use of

billiard rooms, to insure a brilliant and equally diffused white light, with a steady unvarying flame, consuming 18 feet of gas per hour against the 40 to 50 feet consumed by the ordinary billiard lamp, along with a superior light and removal of vitiated air. Experts, it will be seen, have spoken of the Wenham system of lighting billiard-rooms as the most perfect system yet introduced.

But to glance back, the catalogue first of all shows the Wenham lamp in plain forms, as adapted for shops, corridors, halls, staircases, warehouses, printing and other works, factories, &c., attention having been paid to render this excellent system of lighting available for everyday and utilitarian purposes in a simple and uncostly manner. What would serve the purpose of the workshop would not, however, be thought suitable for the drawing-room and dining-room. Accordingly, more tastefully designed lamps are shown. These range through varied stages of more or less elaborate design. This again is a matter of detail that more or less concerns individual tastes, and consequently any particular design that may be desired has only to be sent to the company and it will be carried out. The designs shown in the catalogue include very handsome examples, and much in the

Registered Trade Mark.

way of effect can be got by the employment of ornamental glasses and shades, suggestions for which are shown on page 32 of the list. The lamps in most cases are pendant, if the ceiling lamps may be called pendant for explanatory purposes; and for room lights, halls, &c., we see examples after the ordinary hanging gaselier which terminates in the downcast Wenham light. Besides these fixed pendant lights there are sliding pendants, as for cases where it is a matter of convenience to be able to lower the lamp and raise it again after cleaning globes, shades, &c. The ordinary style of dining-room suspension lamp may be seen with the ordinary upward lights, in addition to the Wenham. Then, again, bracket lamps are shown, a bracket being used for the purpose of suspending the Wenham lamp. An ingenious table lamp is figured among other illustrations, which is practically an application of the Wenham lamp as a standard lamp. Of course it is evident that a standard is inadmissible for the Wenham lamp as far as the characteristic feature of the lamps, namely, absence of downcast shadow, is concerned, by reason of the unavoidable interposition of opaque metal fittings. Yet, as said before, this table lamp, though practically a standard, preserves its pendant character on the principle of suspension to a bracket. The fitting that carries the lamp curves upwards and outwards, and, in following the line of the curve gradually returns over the base of the support below the flame, and in this fashion gets rid of any inconvenience from downcast shadows. No doubt this design could be carried out on a larger scale to suit the requirements of exceptional circumstances or the tastes of individuals. Special attention, of course, is given to the illustration of the Wenham lamps as superseding sunlights, &c., and in their ventilating capacity, as also to the billiard lamps. The works of the Wenham Company, Limited, are in Upper Ogle Street, W. Their London show-rooms are at No. 12 Rathbone Place, W. The company have also branch houses in Paris and in Berlin. The Wenham lamps took the medal of the Sanitary Institute of Great Britain in 1884, the gold medal at the Inventions Exhibition, 1885, and the highest award at the Edinburgh Exhibition this year. The last page in the catalogue gives a list of some of the buildings abroad as well as in England where the Wenham patent lamps are in use. Among these may be mentioned the railway stations at Paddington, Liverpool Street, and Metropolitan District station, Victoria; the printing offices of the *Times*, Stock Exchange, Burlington House, Lyceum Theatre; also at colleges, hotels, clubs, galleries, business premises, &c.

FIREPROOF CEMENT.

AT the invitation of Mr. J. Thomlinson several scientific gentlemen, including engineers and builders, lately visited the premises of the Brighton and Hove Co-operative Supply Association, Brighton, for the purpose of testing the qualities of a cement which he has patented, and which is being largely used in the work of repairing and altering the interior of this building. The material, which possesses properties to which it is desirable that public attention should be drawn, is prepared at the Knothill Cement Plaster Works of Messrs. J. Robinson & Co., near Carlisle. The exact method of its manufacture is at present undisclosed, but it is known that the substance of chief importance in its composition is sulphate of lime, or alabaster, and it is to the presence of this ingredient that is due the greatest merit claimed for the invention. Sulphate of lime being a non-conductor of heat, a substance of which it is the base, is powerful to resist fire; and that the cement has this valuable quality is stated by no less an authority than Captain Shaw, who has expressed the opinion that "it would be much more effectual in preventing the spread of fire than any other of the common plasters or cements generally used in this country." Experiments have shown that heat that will fuse gold, silver, and copper fails to injure the cement. As it neither seems to expand nor to shrink when subjected to tests of that character, its use as casing for the ironwork introduced into large structures is likely, it is contended, to be very great, for the changes which intense heat produce in unprotected iron can cause disasters only second to those which are the more immediate results of fire. Other substances, such as Parian cement, have, of course, equal claims to be considered fireproof, but any approach to a general utilisation of them is rendered next to impossible by their cost. The comparative cheapness of the new cement places it within the reach of the moderately wealthy, and seems to bring within the range of practicability the hope that one day the words, "Tua res agitur, paries cùm proximus ardet," may be robbed of much of their dread significance. As a mere plastering also it has advantages, for it can be quickly applied, dries and hardens in 48 hours, and when dry presents a surface of great smoothness. As a proof of its strength, it may be mentioned that a brick an inch square can bear a strain of 550 lbs. before breaking. Hitherto the cost of producing cement from sulphate of lime has been so great that any general use of such cement could not be expected. That his invention is so much less costly Mr.

THE EMPLOYERS' LIABILITY ACT.

A CASE was heard last week in the Kettering County Court in which Joseph Law, a bricklayer, sought to recover 20*l.* 16*s.* from John Bellamy, a builder, being damages for injury under the Employers' Liability Act. Mr. Rawlings, for plaintiff, said the claim was for injuries received by plaintiff while at work on a scaffolding erected against some houses being built by defendant. On February 26 a carpenter went to work on the scaffolding, with the result that the combined weight broke what was called the "putlock." This let the scaffolding down, and some planks falling on plaintiff, injured him as detailed below. Mr. J. W. Dryland, surgeon, said plaintiff went to him on February 26. He was suffering from a broken collar bone and bruised shoulder. He attended him for three weeks, and on the 8th of this month he examined him. His collar bone was recovered, but he was still unable to raise his shoulder the proper height. It would most likely be well in about three months. Plaintiff told him that he had been to a bone-setter for a month, and that his shoulder was out, but he (witness) denied that the shoulder was dislocated. As a rule they got well in such accidents in something like two months. Joseph Law said his average earnings before the accident were 29*s.* 6*d.* per week, but in the winter he would not earn so much. In February he was working for defendant on some new houses which he was building. He was on the front scaffolding about seven feet from the ground. The scaffolding was put up by several men a few days earlier. Harry Bellamy, foreman to defendant, handed him the "putlock," and held it while he (witness) tied it up. He was told not to leave a hole in the wall for it. Mr. Lane here contended that if Harry Bellamy was to be brought into the question under Order 44, Rule 3 of the Employers' Liability Act, his name should have been mentioned in the plaint. This rule laid down that the plaintiff should state in ordinary language the cause of the injury, the date on which it was sustained, the amount of compensation claimed, and where the injury should have arisen by the act or omission of any person in the service of defendant, the name of such person should be given. Mr. Rawlings contended that they claimed that the accident arose from the defective nature of the materials used, and had nothing to do with Harry Bellamy. His Honour: It is monstrous to make a man liable for the mere accident unless there is any negligence. Mr. Rawlings: I am going to prove that this putlock ought not, under any circumstances, to have been used. His Honour: Then the question is who handed it out to him. Mr. Rawlings: The employer is responsible for any material handed out to his servants. His Honour: I am strongly of opinion that, according to the rule, you ought to have mentioned this putlock in your information. I have been reading over the claim, and wondered what scaffolding it meant. Your particulars are as wide of the Act of Parliament as possible, and it is quite evident, looking at the statute, that it is only fair to the master to know what he has to meet. What you must do is to take a non-suit, and bring your action again. His Honour decided that the question of costs should bide the decision in the pending case.

KAYE *v.* CHUBB & SONS.

THIS case, on which depended an important decision, came before Mr. Justice Mathew (without a jury), sitting in the Queen's Bench division of the High Court of Justice, on Wednesday, the 25th ult. Both parties to the suit are well known as lock manufacturers, and the plaintiff claims damages against defendants and an injunction for an alleged infringement of their patent for the fastening of doors, gates, lids, and windows, in the shape of a lock made on the well-known "push-and-pull" system. Mr. Aston, Q.C., Mr. Macrory, and Mr. Waugh appeared for the plaintiff; and the Attorney-General (Sir R. Webster, Q.C., M.P.) and Mr. Bunting represented the defendants. The following report of the proceedings is taken from the *Leeds Mercury*:—

Mr. Aston, in opening the case, said the plaintiff was a gentleman who for a long time had given great attention to mechanical matters, especially in connection with apparatus for fastening and unfastening doors. The letters patent in question were obtained on December 22, 1877, for improvements of the apparatus employed for fastening and unfastening doors, gates, lids, and windows. The seller's patent was still good and valid, and he should submit, when his lordship had heard the evidence, that the defendants had infringed. This was not a complicated case, and the invention was of a very simple character. Probably the only question for his lordship

FRENCH LIBRARY OF ART.

JUST PUBLISHED. Handsomely bound in Cloth, Broché, 24*s.*; Relié, 28*s.*

LES STYLES.

OVER SEVEN HUNDRED ENGRAVINGS OF DIFFERENT PERIODS, WITH DESCRIPTIONS.

BY PAUL ROUAIX.

"This large and sumptuous book is issued by the publishers of *L'Art*, a journal which we have frequently referred to as being one of the best publications of its kind in Europe. The French Librairie de l'Art has been known for long in connection with works treating of the fine arts, and *Les Styles* is certainly equal to anything we have ever seen of the kind, and by far superior to the vast majority of similar works issued in this country. There is something about the atmosphere of France which confers refinement of taste in everything relating to designs, and so pronounced is the national aptitude for discovering beauty and symmetry, that the very fact of a book coming from across the straits is generally a sufficient guarantee of the artistic excellence of the contents.

"M. Rouaix treats of many species of decoration, commencing with that in vogue amongst the ancient Egyptians, and proceeding in regular order of date with the Etruscan, Greek, Byzantine, Roman, Gothic, the peculiar ornamentation of the Renaissance, and of the times of Louis XIII., XIV., XV., and XVI. Before each division the author introduces a short historical introduction, and afterwards, by means of a series of beautifully executed prints, illustrates the prevailing fashion of the time. For this purpose he has levied contributions on examples of architecture, carving on wood, suits of armour, bas-reliefs, tapestry and embroidery, mural painting, mosaical work, and a host of other subjects, including caskets and chalices. In fact, anything that can be called artistic and assigned with certainty to a particular era is represented, the result being an exhaustive and exceedingly pretty production."—BOOK LORE.

LONDON: GILBERT WOOD & CO. 175 STRAND.

would be, "Was the invention new; and if so, was it infringed by defendants?"

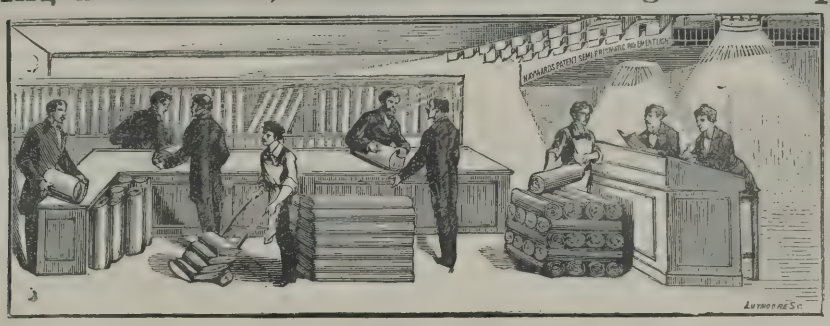
The Attorney-General: I think I may perhaps shorten matters by stating that the one point I make is this—whether, if the plaintiff's specification be properly construed, the defendants have infringed?

Mr. Aston said that if the Attorney-General would say that he did not intend to dispute the novelty of defendants' invention he should be very glad. Before coming to the question of whether the defendants had infringed it would be his duty to explain to his lordship what was the state of public knowledge when the invention was obtained, and he hoped to show his lordship that Kaye's lock was an improved lock compared with all that went before, and that the very elements of improvement found in plaintiff's locks were to be found in Chubb's locks.

Mr. Justice Mathew: But are the elements of improvement to be found in plaintiff's specification?

Mr. Aston: Certainly, my lord. The learned counsel went on to explain that the difference between the plaintiff's door-fastening and those in ordinary use was that, instead of the handle being turned, it was pulled on one side of the door and pushed on the other; that was to say, if the door opened towards you, you pulled the handle and the latch was withdrawn and the door was opened, and if the door opened from you, you pushed the handle and opened the door. Before the year 1877 such a fastening was never seen, and, except for one particular specification, which he would refer to, he thought he should show his lordship that the plaintiff's invention was absolutely new. A great number of specifications were relied on by the other side, but probably the Attorney-General would agree that a great many of them might be eliminated. But when they came to the specification of Mr. John Imray, the well-known engineer, it would be, no doubt, necessary for him to distinguish the plaintiff's invention from that. As far as he knew, except the particular latch proposed to be used by Mr. Imray—for he believed there was no actual use under his patent—there never had been a latch of the same character as the plaintiff's. The difference between the plaintiff's latch and Imray's latch was that in the shutting of the door in Imray's patent, the more he pushed upon the handle the more the door would not close, whereas in plaintiff's fastening pressure upon the handle caused the door to shut. The reason why the door would not shut when the handle was pressed in Imray's apparatus was that the spindle of the handle was embraced in such a way as to hold it fast and not let it go freely; whereas in th plaintiff's patent, the spindle was not embraced and held fast. That made all the difference.

His lordship: One you say would not work and the other does?



Mr. Aston: Yes. One would not work and the other does, and that makes all the difference between success and failure. He should (the learned counsel proceeded) call Mr. Imray before his lordship, and also the patentee of the invention now in question. The latter would tell his lordship that when he had made his invention he was informed of Mr. Imray's prior patent, and thereupon he went to Mr. Imray and obtained that gentleman's assistance in framing his specification, so as if possible to keep it outside of what Mr. Imray had done. He did not mean to say that if Mr. Kaye and Mr. Imray had made a mistake, the mere fact that they tried to avoid a mistake would not release the plaintiff from any consequences of it, but merely mentioned it as a fact in the case. The prior patents to Imray's were of a totally different kind; but Imray's, to some extent, was a latch of the same character. Mr. Imray would tell his lordship that he never made nor sold a single lock according to his patent, and Mr. Imray would give his explanation of the difference between his patent and the plaintiff's, and would explain the reason why his was a failure and plaintiff's a success. He believed that Imray's specification was the most formidable difficulty in his way. Referring to plaintiff's specification, the learned counsel said it set out that plaintiff did not make any general claim to the opening of latches or fastenings by a pull or push of the knob or handle, which was included in Imray's specification; but the plaintiff claimed "the construction of a latch or fastening wherein a lever, worked by the pushing or pulling of a spindle or knob, moves in one direction, only a segment or finger turning on a fulcrum and pressed in the opposite direction by a spring, so as to engage with a catchplate, substantially as and for the purposes hereinbefore set forth."

The Attorney-General said that his learned friend must not take it that Imray was the only difficulty he had to deal with.

Mr. Justice Mathew: Well, Mr. Aston had better kill Imray first.

Mr. Aston further stated that in 1882 Messrs. Chubb & Sons, through Mr. George Chubb, entered into negotiations for the purchase of the patent, and Mr. Kaye thought the negotiations were practically concluded. They fell through, however; but now the defendants were disputing the utility and novelty

of that which formerly they were prepared to buy. The defendants then set to work and made a lock which was, he contended, substantially the Kaye lock, and therefore the present action.

At this point the hearing was adjourned, the Court rising at 1.30, in consequence of a meeting of the Judges.

The case was resumed on Thursday.

Mr. John Imray, engineer and patent agent, gave evidence on behalf of the plaintiff, and deposed that plaintiff's was a novel and useful invention. It differed from his invention, patented in 1871, which was not successful. That possessed such disadvantages that it was practically useless for ordinary use, and he had never made or sold a lock constructed according to his specification. Plaintiff's lock was, however, successful. In the lock of the defendants, which constituted the alleged infringement, witness said there were the elements of plaintiff's invention. The witness was examined and cross-examined at great length as to the details of the different locks, which he explained to his lordship with the aid of models.

Mr. Aston said the Attorney-General had agreed with him that it was unnecessary to call several witnesses that he had present to support Mr. Imray, it being understood that he had such evidence.

The Attorney-General said he would admit the utility of the plaintiff's invention and its actual user.

It was further agreed that it was not necessary to call Mr. Kaye, as he only confirmed Mr. Imray, and the Attorney-General did not dispute that he was the first and true inventor of what he described in his specification.

This, therefore, was the plaintiff's case.

The Attorney-General said he had only one or two witnesses to call, and, before doing so, he would merely state that his contention was that his lordship had to put upon the plaintiff's specification a construction which would make it good, having regard to the existing state of knowledge at the time of the patent. He contended that the plaintiff was not entitled to turn a particular statement in the specification into a generality, which was what he proposed to do to prove the infringement.

Mr. Edward Alfred Cowper, consulting engineer, gave evidence on behalf of the defendants that plaintiff's invention was a combination of old parts, the novelty being in the mode in which the lever acted upon the spring. He further said that the defendants' lock was not an infringement of plaintiff's patent.

Sir G. Chubb corroborated Mr. Cowper. He admitted that his firm entered into negotiations with Mr. Kaye for the purchase of this patent, but they fell through owing to the price being too high. After the negotiations fell through he invented the lock, which it was now said was an infringement.

The Attorney-General said the plaintiff's invention was a combination of three old parts, and it was familiar knowledge that such a patent could only be infringed either by taking the same combination substantially, or a subordinate combination, which the patentee had pointed out in his specification. Mr. Kaye was no doubt entitled to the benefit of what was novel in his invention, and therefore the learned counsel did not ask that the patent should be invalidated, but he submitted that the defendant had not infringed it.

Mr. Aston having replied, contending that an infringement had been made out,

His lordship reserved judgment.

On Saturday the Court was crowded in expectation of the result of the case.

His lordship, in delivering judgment, said the action was brought for the infringement of a patent taken out by the plaintiff in 1877 for an improved method of opening and shutting doors, and the only grounds of defence upon which reliance was placed was a denial of novelty and of infringement. The object of the plaintiff's invention was to produce a ready means of opening or shutting doors by pulling or pushing a handle instead of turning it, and the mode in which this object was effected was by fixing upon the spindle between the handles a projection which was placed in contact with one end of a lever, the other end of the lever touching the segment or finger of the latch. When the handle was pushed forward the latch was thus drawn back and the door opened. When the handle was pushed back, the pressure of the lever was withdrawn from the latch, and the spring pushed the latch back into position and the door was closed. The plaintiff made no claim to the push or pull spindle, which was known before, but his claim was confined to the purposes he had described, where a lever working by the push and pull motion moved a segment or finger in one direction only, and also where the latch was pressed in an opposite direction by a spring, and so worked automatically. In support of the defence for want of novelty, reliance was placed upon letters patent granted to John Imray in 1871. It appeared from the specification filed by Imray that one of the objects of his invention was the construction of a spring, also to be worked by pulling or pushing the handles, and for this purpose the spindle was made with a groove in it,

which was attached to a lever connected with a spring. But it appeared from the evidence of the patentee (Mr. Imray) that while it was easy to open the door by his process, there was a difficulty in closing it, and this was due to the rigid connection of the lever with the spindle at the one end, and the latch at the other. The invention was of no practical utility, and the letters patent were allowed to drop. The Attorney-General argued that Imray had anticipated a part of plaintiff's apparatus by describing the spindle as being made in a groove, or in the alternative with a projection or collar upon it, and it was contended that a skilled workman would, from that specification, have produced a spindle which, like the plaintiff's, was in free contact, and not rigidly connected with the lever by means of the projection upon it. But he was satisfied that Imray's patent was not an anticipation of plaintiff's combination as described and claimed by his specification. The defendants' lock was constructed with a spindle having a projection upon it, which was in contact with one end of the lever; the other end of the lever was in free contact with the slot of the segment latch. When the handle was pushed forward the latch was drawn back and the door opened. When the handle was drawn back a similar resulted followed. It seemed to him only necessary to lay the two locks side by side to see that the mechanism was substantially identical. It made no real difference in the apparatus that the spring which operated directly upon the segment latch of the plaintiff's lock acted through the medium of the lever in a similar manner in the defendants' lock. But admitting the identity of the lock, it was argued that the plaintiff's specification did not claim the whole apparatus of the lock, but only a subordinate part, viz., in a lever movement in one direction only, and the segment or finger being pressed in the opposite direction by the spring, and this combination, it was said, defendants had not infringed. It was urged that all the defendants had done was to combine a segment latch acted upon by a spring, which had been described in letters patent granted to one Brodie in 1860, with the apparatus of Imray, patented in 1871, and that they had avoided the exact combination claimed in the specification. But his lordship did not think plaintiff's specification ought to bear this narrow construction. The claim must not be interpreted as if it stood alone. It must be read in the light of what was contained elsewhere in the specification. So dealt with it seemed to him that all the elements of the plaintiff's lock were properly claimed, and he was of opinion that the elements so claimed by the plaintiff were also contained in the apparatus of defendants' lock. His judgment, therefore, would be for the plaintiff, with costs.

Mr. Aston asked for costs on the higher scale.

Mr. Bunting said he failed to see in what respect this action was extraordinary.

His lordship said he gathered that it was a highly important case, and that a good deal depended upon the result. It certainly was not a case proved in the ordinary way, and by witnesses of the ordinary class. It was a case which needed a great deal of care and attention. He therefore thought costs should be on the higher scale.

Mr. Aston asked for a perpetual injunction against the defendants, and an order for an account of the profits they had made by their infringement to be taken.

Mr. Bunting asked that the injunction might be stayed pending an appeal.

Mr. Aston contended that there was no authority for such a course.

His lordship ultimately said he would enter judgment for the plaintiff for a nominal amount of 40*s.*, for an account of profits to be taken, and for an injunction, the latter to be suspended pending an appeal to be entered forthwith.

Judgment for plaintiff accordingly.

BUILDERS' BENEVOLENT INSTITUTION.

THE election of pensioners on the funds of this Institution took place on Thursday in last week, at Willis's Rooms, St. James's, Mr. Basil E. Peto (president) in the chair. There were two vacancies for men, for which five candidates applied. The following is the list of candidates, with the number of votes polled for each, according to the report of the scrutineers, Messrs. Stirling & Rider, viz. :—Ebenezer Robinson, Camberwell, aged 72, builder, 1,784 votes; James Picking, Clapham, aged 60, builder, 318 votes; John Emery, Kentish Town, aged 65, builder, 1,799 votes; Edward T. Roberts, Wandsworth, aged 67, builder, 786 votes; and George N. Cott, Brixton, aged 68, builder, 227 votes. John Emery and Ebenezer Robinson were therefore declared to be the successful candidates.

On the motion of Mr. T. G. Smith, seconded by Mr. Richardson, a vote of thanks was passed to the Chairman, a similar vote being also accorded to the scrutineers and others who had taken part in the proceedings.

"THE PEDESTAL VASE,"
JENNINGS' IMPROVED W.C. APPARATUS

(Combination Urinal and Slop Sink).

Registered No. 16,300.

A PORCELAIN VASE set on a tiled or mosaic floor, within walls or a dado of glazed tiles. The usual wood framing, forming a storehouse for the retention and accumulation of *damp*, *dirt*, and *disease germs*, with the joints, crevices, and imperfections in work which the closet enclosure so often conceals, is entirely abolished. The seat is hinged, permitting free access for use as a *slop sink* or *urinal*, and for cleansing, so that the entire apparatus and space can be freely washed down. For this latter purpose the floor should be slightly sunk, and laid to fall to a grating, with waste carried through the external wall, and terminating in a copper flap valve to prevent draught.

☞ The suggestions as regards wall linings and floor, may, of course, be modified as best adapted to the building in which the closets are used; and in the consideration of such details, alternative schemes will readily present themselves.

At the recent **HEALTH EXHIBITION** (South Kensington, 1884), amongst a series of official tests, under the supervision of Baldwin Latham, Esq., C.E., and the Jury No. 9, Class XXIII., and successfully withstood by this closet, the following may be cited in evidence of its efficient action. Being fixed in position shown in illustration, with **"JENNINGS' PATENT SINGLE FLUSH WASTE-PREVENTING SYPHON CISTERN"** 5 feet over, with 1¼ inch down pipe, ten apples (averaging 1¼ inch diameter) and a flat sponge about 4½ inch diameter were thrown into the basin. The water, as well as the whole of the exposed or dry surface, was first blackened with plumber's "smudge," and the sides covered by four pieces of thin sanitary paper, which adhered closely to the soiled surface. The handle of the cistern was then pulled, and the two-gallon flush liberated. After seven seconds (the time occupied by the discharge), a receiver placed under the trap outlet was removed, containing in the blackened water **the ten apples, the sponge, and the four pieces of paper,** no traces of the soil remaining visible upon any part of the apparatus.

GOLD MEDAL AWARDED.

THESE CLOSETS are already in use in Hospitals, Banks, Hotels, Offices, Private Residences, &c., with most satisfactory results, and, fixed in the manner described, in appearance and action leave nothing to be desired. By the novel arrangement of the supply to Basin, as shown in the sectional sketch annexed, the whole surface is well flushed and cleansed, whilst the bottom of Basin and Trap are thoroughly scoured by a concentrated rush of water which insures the **instantaneous removal** of the contents, thus overcoming the inherent defects in the many imitations recently produced of **"JENNINGS' MONKEY-CLOSET"** (the **original form of wash-out watercloset**), which was invented and patented by G. J. in 1852.

REGISTRATION OF PLUMBERS.

GUILDHALL, AUGUST 12, 1886.

1. In pursuance of the Resolutions of the following—
   (*a*) The Conference of Metropolitan and Provincial Plumbers held at the City and Guilds of London, Central Institute, in October 1884;
   (*b*) The General Council subsequently formed to give practical effect to the Resolutions of that Conference;
   (*c*) The Plumbing Trade of London assembled in general meeting at Guildhall, January 25, 1886.
2. A Register for Plumbers of the City of London, and a circuit of seven miles thereof, has been opened by the Worshipful Company of Plumbers.
3. The object of the Registration is to enable the public to distinguish between qualified and unqualified practitioners.
4. All applications are considered by a Special Committee of Registration, which includes Members of the General Council as well as practical Plumbers, in order that no trade interest or prejudice may operate against any Applicant, but, on the contrary, that the utmost fairness and impartiality may be secured to all.
5. Plumbers (Masters and Journeymen) established in the Trade prior to March 1, 1886, are not necessarily required to undergo any examination. Admission is granted to such Plumbers on satisfactory statement or proof of experience, according to the circumstances of each case.
6. All Applicants who cannot satisfy the Registering Committee of their experience are required to pass an examination by a Board of Examiners, composed largely of practical Plumbers.
7. No Plumber entering the trade after March 1, 1886, will be admitted to the Register unless he shall have passed an examination in the technology and practice of plumbing.
8. The Company is not connected with any Plumbers' Societies or Trade Organisations formed for other purposes, and the function of the Registering Committee is confined to distinguishing those who are fairly entitled to be registered as qualified Plumbers; the object being thus to raise the standing and efficiency of Plumbers as a body in a manner consistent with the important position they occupy in relation to the public health.
9. The Registration of the Plumbers of the London District is adopted as a preliminary step to the extension of the system of Registration throughout the Kingdom by means of Local Organisations.
10. Pending the establishment of Local Registers, Provincial Plumbers are admitted to the Company's Register on the same conditions as the Plumbers of the London District.
11. Plumbers admitted to the Register receive Certificates of Registration bearing the Company's Seal and Arms, A.D. 1568. None but the holders of such Certificates are entitled to use the letters R.P. (Registered Plumber) after their names. Lists of the names and addresses of Registered Plumbers are obtainable on application to the Company.

GEORGE SHAW, Master.

EDITORIAL NOTICES.

The authors of signed articles and papers read in public must necessarily be held responsible for their contents.

No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.

Correspondents are requested as much as possible to make their communications brief. The space we can devote to Correspondence will not usually permit our inserting lengthy communications.

INTERNATIONAL HEALTH EXHIBITION.—MEDAL Awarded for

LEGGOTT'S PATENT ADJUSTMENT,

FOR FANLIGHTS, SKYLIGHTS, &c.,

Is admitted to be the best ever put before the Public.

From 5s. each.

TESTIMONIAL.

BANGOR, N. Wales: September 14, 1885.

Sirs,—I have pleasure in testifying that I have used Leggott's Silent Adjustments for various buildings to high skylights, fanlights, and top parts of windows, and in every case they gave satisfaction. They are secure in whatever position, whether the window is open or closed, and are quite simple and workable in their action. I prefer them to any other that I have seen or used for the above-mentioned purposes.—I remain, yours obediently, R. DAVIES, Architect.

Messrs. W. & R. LEGGOTT, Bradford.

TO ARCHITECTS, CONTRACTORS, AND BUILDERS.

SAVE ONE-THIRD of COST and TIME in your PRIMINGS by using

KALLKOLITH.

IT produces an exquisite smoothness, and amalgamates thoroughly with WOOD, STONE, IRON, CEMENT, PLASTERING, &c. IT is less than HALF the WEIGHT, and IT goes further than three times the same quantity of ordinary priming. IT has to be thinned with two parts of water for use on Stone, Cement, and Plastering, and with seven parts of water for Smoky Ceilings and for preparing Walls for Colouring and Paper Hanging. IT dries in from ONE to TWO hours, effecting a great SAVING in TIME. IT lasts longer and better than any other priming known, and prevents Blistering.

Price per Case of Eight Tins of 14 lbs. each, 40*s.*, packing included. Sample Tins, 6*s.* each.

H. RANSOM & CO., 11 Queen Victoria Street, LONDON, E.C.

Agents wanted in every Town in the United Kingdom and Colonies.

IMPORTANT.—To Specialists, Manufacturers, and Others.

Effective Advertising at a Minimum Cost. Now in preparation for Publication in January. Demy 4to, Illustrated.

THE ARCHITECT AND CONTRACTOR'S COMPENDIUM

And Specialist's Directory for 1887.

EDITED BY JOHN E. SEARS, A.R.I.B.A., F.A.S.

An illustrated and priced catalogue and directory of specialities, manufactures, and requirements in every branch of the Building Trade, and in office and workshop, carefully classified and indexed, combined with an Office Diary, Legal and General Information, Copies of Building Acts and By-Laws, Tables, and Memoranda. Illustrations may be inserted produced by the Litho- or Ink-Photo process. In addition to the usual circulation of a first-class Annual, **the Publishers guarantee to send a copy gratuitously to every Architect and Builder whose name appears in the London Directory.** Advertisements will thus for twelve months be in a convenient and attractive form before the eyes of the people Advertisers specially desire to reach, and this **at a cost less than half that of sending out one circular.**

The minimum **guaranteed circulation** of the **Compendium** is 3,000 copies, but the actual circulation will probably reach a much higher figure.

Special attention is directed to the fact that, at great expense, the Publishers have arranged to illustrate this work by the magnificent **Ink-Photo** process, specimens of which are to be seen weekly in *The Architect*. The **Compendium** will thus be far ahead as an artistic production of any class Annual published, adding greatly to its value as an advertising medium. The Ink-Photos can be produced, **without block,** from **any** drawing or photograph, and printed in any tint. The charges are very moderate, and will be quoted on application.

An exceptional opportunity is thus afforded Country and Colonial Firms to introduce their manufactures to the London market. The Compendium will be produced in first-class style, and will doubtless become a standard work of the trade.

Prospectus, with full table of contents, &c., free on application; but Advertisements and Blocks should be forwarded at once to the Advertisement Manager, 16 New Bridge Street, London, E.C.

London: JAMES SEARS & SONS, Printers and Publishers, Crane Court, Fleet Street.

TRADE NOTES.

WE notice that Messrs. Carter, Johnson & Co., of Worcester, have laid a very handsome tile pavement at St. Andrew's Church, Worthing, under the direction of the architect, Mr. A. W. Blomfield; also have just completed the tiling at the old church of Pentlow, Essex, which has undergone restoration, Mr. W. M. Fawcett, of Cambridge, being the architect—making in all nearly fifty churches in which their encaustic tiles have been used during the present year in England.

A HOUSEHOLD TREASURE.
75 PER CENT. LESS FUEL BURNT BY USING CONSTANTINE'S
PATENT "TREASURE"
COOKING RANGE,

With the Patent Rising Fire Grating for reducing or enlarging the Fire. The FIRST PRIZE was awarded to the Patentee, after nearly one thousand tests of a variety of Ranges, by the Smoke Abatement Exhibition, Ladies' Committee, South Kensington, as well as the Grand Prize by the Exhibition, First Silver Medal. Vide *Times*, July 18 and 19, 1882. Also received Highest Awards at the Medical and Sanitary, the Fisheries, the Health, and the Inventions Exhibitions.

DISTINCTIVE MERITS:—*Perfection in Cookery—Economy in Fuel—Smoky Chimneys effectually Cured—Unsurpassed for Durability—May be placed anywhere.*
Illustrated Price Books, with Testimonials, Post Free.

A. R. CONSTANTINE, 61 FLEET STREET, E.C.
N.B.—Judges have conferred Greatest Honours, Highest Awards Gold and Silver Medals at all Competitive Exhibitions. ESTABLISHED A QUARTER OF A CENTURY.

THE floors of St. Joseph's Church, Blundellsands, near Liverpool, lately opened, and erected from the designs of Mr. A. E. Purdie, of London, have been laid with the patent wood-block flooring of Mr. Roger L. Lowe, of Farnworth, near Bolton.

THE registering turnstiles for the entrances of the Adelaide Jubilee Exhibition, which is to be held next year, are to be sent out from England. The pattern selected is Norton's patent, and these turnstiles are being supplied by Messrs. Le Grand & Sutcliff, of 100 Bunhill Row, E.C.

THE sale of a large stock of bricks was held last week at Dunmow. Building bricks went from 17*s.* to 30*s.* per thousand; splay and coping bricks from 35*s.* to 40*s.* per thousand; and drain pipes from 22*s.* to 54*s.* per thousand.

A NEW process for making steel pipes is now employed at Burbach. A syndicate has been formed to build works, the capital being 1,200,000 marks, of which 500,000 marks are issued to the patentee, A. Mannesmann, of Remscheid. It is proposed to apply the method to the manufacture of copper tubing. The process is as follows:—As soon as the steel is cast into the round mould a core is thrust into the steel, so that a tube is formed between it and the walls of the mould. In order to prevent cracking of this annular casting during cooling, the core is so made that it follows up the shrinkage of the steel. The steel cup thus obtained may then be rolled in an ordinary train.

THE Sewerage Committee of Aberdeen Town Council have approved of the surveyor's recommendation to lay a new sewer from Ladymill along the Links to Abercromby Jetty at the harbour entrance, which will drain in its course the irrigation farm and the large districts in Constitution and York Streets. The cost of the work is estimated at 10,000*l.*

THE Liverpool Corporation have, it is said, sold the whole of Kensington Fields by private treaty for building purposes. The property has been purchased under the conditions of a perpetual ground-rent by a number of persons, and the building operations will commence shortly. The prices obtained for the land ranged from 50*s.* to 19*s.* per yard.

WE understand that the directors of the City and Central Dwellings Co., Limited, 3 Newgate Street, E.C., have resolved to pay an interim dividend in January next at the rate of 5 per cent. per annum for the current quarter.

MR. C. H. MABEY of Storey's Gate executed the whole of the exterior carving in red Mansfield and Portland stones at the Guildhall School of Music, including the trophy panels in front and pediment over principal entrance.

THE *Ladies' Pictorial* has been fortunate this year in finding a picture that is well adapted for translation into chromolithography, and the plate of "The Young Cavalier," by M. Mordecai, from a painting which was exhibited this year in the Royal Academy, will give delight in many households. The artist has evidently studied in France, as may be judged from his skill in the use of colour.

THE prospectus of the new Leaseholders' Fund Corporation merits the attention of large and small capitalists. An undertaking which has among the directors such surveyors as Mr. Beadel, M.P., and Mr. Francis Vigers, and with a manager like Mr. Martin Vigers, has a sufficient guarantee that it is free from risk, for these gentlemen have a profound knowledge of property, and are not likely to meddle with anything that is not based on the soundest principles.

CONTRACTS FOR WATERWORKS AND LIGHTING OF BELGRADE.

THE Earl of Iddesleigh has received a despatch from Her Majesty's Minister at Belgrade, notifying that the Municipal Committee of that town have resolved to undertake works to supply it with water, and also to drain and light it. Concessions will be granted for these works, either separately or for the whole together, to the lowest bidder, and are open to public competition for four months, viz., up to the 10th (22nd) March, 1887. No model forms of contract have as yet been prepared for these contemplated works, as the Municipality desire competitors to formulate their own proposals. The population of Belgrade is from forty to forty-two thousand. The town has recently been surveyed by Austrian engineers, and photographs of the plans of the survey can be obtained for a sum of twenty francs the set, on application to M. Bogitchévitch, the Mayor of Belgrade. Her Majesty's Minister adds that the agents of any firms seeking to obtain these contracts should be conversant with the German or French language.

FRENCH LIBRARY OF ART.

JUST PUBLISHED. Handsomely bound in Cloth, Broché, 24*s.*; Relié, 28*s.*

LES STYLES.

OVER SEVEN HUNDRED ENGRAVINGS OF DIFFERENT PERIODS, WITH DESCRIPTIONS.

BY PAUL ROUAIX.

"This large and sumptuous book is issued by the publishers of *L'Art*, a journal which we have frequently referred to as being one of the best publications of its kind in Europe. The French Librairie de l'Art has been known for long in connection with works treating of the fine arts, and *Les Styles* is certainly equal to anything we have ever seen of the kind, and by far superior to the vast majority of similar works issued in this country. There is something about the atmosphere of France which confers refinement of taste in everything relating to designs, and so pronounced is the national aptitude for discovering beauty and symmetry, that the very fact of a book coming from across the straits is generally a sufficient guarantee of the artistic excellence of the contents.

"M. Rouaix treats of many species of decoration, commencing with that in vogue amongst the ancient Egyptians, and proceeding in regular order of date with the Etruscan, Greek, Byzantine, Roman, Gothic, the peculiar ornamentation of the Renaissance, and of the times of Louis XIII., XIV., XV., and XVI. Before each division the author introduces a short historical introduction, and afterwards, by means of a series of beautifully executed prints, illustrates the prevailing fashion of the time. For this purpose he has levied contributions on examples of architecture, carving on wood, suits of armour, bas-reliefs, tapestry and embroidery, mural painting, mosaical work, and a host of other subjects, including caskets and chalices. In fact, anything that can be called artistic and assigned with certainty to a particular era is represented, the result being an exhaustive and exceedingly pretty production."—BOOK LORE.

"Crammed with admirable cuts, arranged chronologically, and grouped under headings."—ATHENÆUM.

Single Number, 5*s.*; Complete Series, 12 Numbers (by Subscription), £2 8*s.*

BEAUTIFULLY ILLUSTRATED.

FANTAISIES DÉCORATIVES.

BY HABERT DYS.

"Beautiful plates. Examples of the finest colour printing, and for variety and grace of design they could scarcely be surpassed. Decorators might gain many hints both for designs and schemes of colour by a study of this excellent publication."—GRAPHIC.

"The illustrations are nicely coloured, neatly drawn, and very spirited."—ATHENÆUM.

LONDON: GILBERT WOOD & CO. 175 STRAND.

MAINTENANCE OF STREETS.

A REPORT on the Maintenance of Streets in Towns has been prepared for the city of Rochester, N.Y., by Messrs. Aldridge, Holly & Kuichling. It contains much information on the English practice. In London, with Guernsey granite rolled macadam (original cost 1.61 dol. to 1.85 dol. per square yard), the average cost of maintenance was about 7 cents per square yard; this cost varied from 3⅓ to 50 cents, and in some cases as high as 1.00 dol. per square yard for individual cases. The average cost of repairs on London granite block, on 36 miles of streets, was, up to 1840, for blocks 6 inches wide, 2 cents per square yard per year. During eight years (1848–56) Margate Street, paved with blocks 3 inches wide, cost 7½ cents per square yard per year; and for the same street between 1848–64 the average was 9 cents. In 1854 the average cost of repairs on all London granite block pavement was 6 cents per square yard.

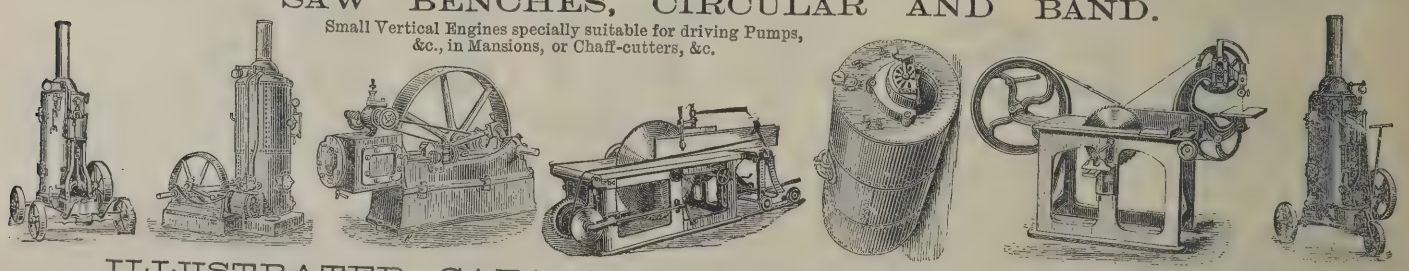
In Birmingham, the maximum wear of granite macadam under heavy traffic was a little less than 6 inches in one year (1853); with this one exception the maximum wear was 4 inches and the average wear 2 inches per year. At this rate the cost of maintenance was estimated at 8 cents per square yard per year. Another engineer of the same place puts the average for macadam at 23 cents and for granite block pavement at 2½ cents per square yard per year.

In Derby, Mr. E. B. Ellice-Clark in 1876, from eleven principal streets laid with granite macadam under considerable traffic, put the annual average cost of maintenance at 22 cents per square yard, and 6 cents for the average of one street laid with granite block pavement.

In Liverpool, Mr. Newland, upon nine streets laid with granite macadam, found for three years (1848–50) that the average cost was about 20⅝ cents per square yard per year; he found a minimum cost of 7½ and a maximum of 36⅝ cents per square yard.

Mr. Kuichling, in an appendix, devotes a number of pages to the cleaning and maintenance of streets. He first refers to the removal of ashes and rubbish, and attempts to impress upon householders the importance of acting in concert with the city authorities in this line, and to separate the slops or organic matter from the inorganic waste. He suggests that all combustible matter be destroyed in the kitchen range, instead of being allowed to accumulate about the premises; with such a course generally adopted the result would be a riddance of what otherwise soon becomes offensive, and the removal of a vast quantity of material that finds its way now into the sewers, gives forth noxious exhalations, and must be ultimately removed at great cost.

In speaking of the dust, mud, and dirt that so rapidly accumulates on paved and improved streets he ascribes its presence, first, to the finely-divided earthy and organic matter transported by the winds from distant points; second, to the wear in the street surface itself, which, according to a large collection of statistics, is found to range as follows :—



On granite pavement . .	0·05 to 0·22 inch per year.
On wood pavement . .	0·14 to 0·33 ,,
On granite macadam . .	1·00 to 6·00 ,,

As thus shown, the inferior classes of pavement create the greatest amount of mud. Third—the earth, soil, or sand which works up through the interstices of the pavement as a result of settlement from defective foundation. In gravel and macadam roadways this last is one of the principal causes of mud and ultimate destruction, and can only be remedied by careful underdrainage, which practically means re-construction. With the modern system of water-tight sewers this thorough underdrainage is especially necessary for the maintenance of any permanent roadway. Fourth—earth, dust, and organic matter is unavoidably deposited directly upon the paved street from passing vehicles or animals; and large quantities are washed by rain from unimproved into improved roadways.

The character and composition of mud accumulating upon paved streets varies greatly with the class of pavement. Dr. Letheby and others have analysed samples from London stone-paved streets, and found a complete mixture of water, comminuted stone, earthy matter, horse manure, iron from horse-shoes and wheel-tires, and fragments of leather, wood, cloth, paper, &c., in almost endless variety. Organic matter is present in greatest quantity in dry weather, and least in wet weather, thus indicating that in the latter case the abrasion of stone and iron is greatest. The average proportions of the principal ingredients of the mud are found as follows :—

	Average.	In Dry Weather.	In Wet Weather.
Per cent. abraded stone or minerals	30	41·8	79·5
Per cent. abraded iron . . .	13	41·8	79·5
Per cent. organic matter and manure	57	58·2	20·5
Total . . .	100	100	100

VOLUME XXXV. OF THE ARCHITECT.
Handsomely bound in Cloth, Gilt Lettered. Price 12s. 6d. Office: 175 Strand, London, W.C.

COLES, STEWART & CO.,
STOCK AND SHARE BROKERS.

Messrs. COLES, STEWART & CO. undertake every description of Stock Exchange business, and have special and early information on all leading Stocks; they are also continually advised by telegram from the chief Mining centres, both at home and abroad. For Investment Messrs. C., S. & Co. make only one charge of $\frac{1}{16}$ per cent. commission on all descriptions of Stocks, and open Speculative accounts with from 1 per cent. cover and upwards, without any further risk or liability to their clients whatever.

THUS, £5 commands £500 Stock; £10, £1,000 Stock; £50, £5,000 Stock;
And so on to any amount.

In the transaction of speculative business Messrs. C., S. & Co. make no charge for commission or brokerage whatever unless their client makes a profit, when they take 5 per cent. of the profit made as their remuneration.
All transactions advised by wire as soon as completed. Monthly Circulars and Mining Reports post-free on application.

COLES, STEWART & CO., St. Stephen's Chambers, LONDON, E.C.

Dr. Letheby also found the amount of organic matter contained in dried street mud from different London pavements was on the average :—

From stone pavement .	.	22·8 per cent. of the bulk.
From wood pavement .	.	60·0 ,, ,,
From macadam pavement	.	4·0 ,, ,,

From this statement it is seen that wood pavement yields the greatest volume of organic matter and macadam the least ; but the detritus from the latter is vastly greater per unit of area, and it makes up in quantity what it lacks in proportion.

From reports and statistics, principally foreign, the quantities of mud to be dealt with appear as follows :—For convenience these statistics were all reduced to an average roadway one mile long, 37½ feet wide, containing 22,000 square yards. The number of loads, of 1¼ cubic yards, collected weekly, per mile of roadway containing 22,000 square yards, was as follows :—

Manchester, England, macadam, average .	.	15 to 17	loads.
Manchester, England, macadam, dry weather	.	27	,,
Manchester, England, macadam, wet weather	.	81	,,
London (Bridge), granite block, dry .	.	101	,,
Liverpool, England, granite, asphalt joints .	.	15 to 27·3	,,
Liverpool, England, granite, common joints	.	27·4 to 37·9	,,
Liverpool, England, macadam, paved gutters	.	26·8 to 57·7	,,

Asphalt and wooden block develop of themselves small amounts of mud and dust, and this is also true of stone-block with cement, pitch, or asphalt joints. In Birmingham, the city engineer reports the largest amounts of mud collected daily per 1,000 square yards of pavement as follows :—

From wood pavement in one day about	.	0·33 loads.
From common granite in one day about	.	2·00 loads.
From macadam in one day about .	.	12·00 loads.

The following is given from various authorities as the average quantity of street dirt which experience has proved will form during only a few days upon properly kept roadways in large English towns :—

	1	2	3
	Square yards of road.		
On macadam one load of dirt per .	344	250	250
On granite block one load of dirt per	500	1,000	1,500
On wood block one load of dirt per .	1,666	3,000	3,000
On asphalt one load of dirt per .	4,000	—	—

The figures in columns 1 and 2 are attributed to E. B. Ellice-Clark, formerly City Engineer of Derby ; column 3 is taken from a report of the Paddington (London) vestry for 1878.

In summing up upon the foregoing it is seen that the quantity of mud accumulating upon a paved roadway during a given period is very variable. One set of authorities claims that the better the maintenance of a roadway and the oftener it is swept, the less will be the mud accumulation and cost of repairs. As Mr. Kuichling says, this proposition will hardly hold good for stone or wooden block pavement, but appears to be true for macadam. In the latter the smoother the surface is kept the obvious less wear by the wheels of heavy wagons and the less pulverised stone resulting from such abrasion. Thorough cleaning, too, brings to light defects which would otherwise be overlooked. The bulk of evidence from many localities points to the fact that a coating of mud and dirt is generally detrimental to a pavement, notwithstanding the fact that a very few authorities look upon this mud as a protection from wear and injury. Macadamised roads should be cleaned frequently, rather than once or twice per year, but they should be scraped only when the dirt is soft and plastic. The liquid mud is best removed by careful sweeping with soft bass brooms. The experience of Manchester, Birmingham, and other English cities shows that with a proper application of water and sweeping machines a saving of nearly one-third of the material required for the repair of macadam roads can be effected.

BUILDING IN LEEDS.

THE annual report of work done in the year ending August 31 has just been presented to the Building Clauses Committee of the Leeds Corporation by Mr. Davidson Hainsworth, inspector of buildings. It shows that 1,380 plans had been submitted. Of these 13 were taken away for alteration and not returned, 1,196 were approved, and 148 were rejected. The plans approved referred to 1,596 houses, 564 cases of alteration, 818 ashpits and other conveniences, and 609 mills, workshops, &c. Among the rejected plans were 217 relating to houses. The house plans approved included 13 villas, 10 semi-detached villas, and 441 through and 1,132 back-to-back houses. Fourteen miscellaneous plans included one cemetery chapel, two additions to churches, five mission-rooms, one Salvation Army

FOR TONE, TOUCH, GENERAL FINISH, AND GOOD VALUE.

Wholesale and Retail Depot :—London, 211 Regent Street, W.

The Celebrated "DUBOIS" Hydraulic Drawn Lead TRAPS and BENDS.

The above Shapes and Sizes always in Stock, and we are prepared to furnish SPECIAL SHAPES to order at short notice. These justly celebrated TRAPS are made from Pure Pig Lead by Hydraulic Machinery after the manner of Lead Pipe, and have peculiar advantages appreciated by every Plumber. They are greatly superior to either Cast or Hand-made Traps, as they have no SEAM, are of UNIFORM THICKNESS, PERFECTLY SMOOTH INSIDE AND OUTSIDE, and can be FLANGED, PLUGGED, and STRETCHED, without fear of SPLITTING. No possibility of Sandholes.

FOR PERFECTION OF MANUFACTURE THESE GOODS ARE PRE-EMINENT.

For Sale generally by the principal Lead Merchants and Wholesale Dealers in Plumbing and Sanitary Appliances throughout Great Britain and Ireland.

DUBOIS MANUFACTURING CO., LONDON AND NEW YORK.

London Office and Works :—15 BRITANNIA STREET, KING'S CROSS, W.C.

Barracks, one school, one Home for Waifs and Strays, and one club. During the year there had been certified for occupation three villas, three semi-detached villas, 378 through houses, and 719 back-to-back houses; while 711 miscellaneous buildings and 771 closets and ashpits, &c., had been completed and certified.

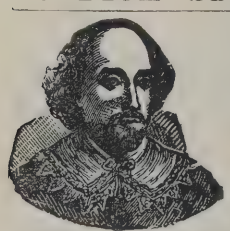
INSTITUTE OF AUCTIONEERS AND SURVEYORS.

ON Wednesday the adjourned meeting in connection with the founding of the new Institute of Auctioneers and Surveyors was held in the Cannon Street Hotel. Mr. J. M. Klenck, who presided, in opening the proceedings stated that an impression had gone abroad that it was the wish of the society to become rivals of the Surveyors' Institute, but on behalf of the committee he desired to state distinctly that that was not the case. They believed that there was a wider field for their society, which would take in a branch of the profession that the Surveyors' Institute did not touch. Since the last meeting they had only had two withdrawals, but they had added to their numbers 81; and now that it was known that the Institute was going to be started many members of the profession who were holding back would come forward and join the society. Everything would be left open to the council as to the rules of the Institute and the election of its members, president, and vice-presidents. The committee had received a large amount of correspondence favourable to the movement. Some hundreds of gentlemen had already joined the society, which the committee believed would be a great success.

The Secretary (Mr. G. J. Ottley), at the request of the chairman, then read the report of the preliminary committee appointed at the meeting of October 6. It stated that the committee met for the first time on the 20th of that month, when the draft rules were laid before them. Since then the committee had assiduously devoted themselves to the task allotted them of revising and perfecting the rules. As they had stated in circulars issued on the 18th and 29th ult. drawing attention to the progress of the movement, copies of the rules could be obtained on application at the offices of the Institute, 57 Moorgate Street. The committee recommended the following gentlemen to serve upon the council, subject to the approval of the members, leaving the remainder of the members—eight for London and thirteen for the provinces—to be filled up by the council as they might think fit:—Messrs. J. M'Clelland, Liverpool; J. L. Yarker, Manchester; W. H. Sheldon, Rotherham; A. Brodie, Consett; J. H. Willoughby, Gravesend; A. H. Wansborough, Weston-super-Mare; J. Earp, Derby; R. Flowers, Newcastle; C. A. Galpin, Oxford; W. F. Perkins, Southampton; B. M. Bradbeer, Lowestoft; and for London, Messrs. J. M. Klenck, H. J. E. Brake, B. Brown, Abram Smith, L. S. Snell, E. Ingham, and G. Stanham. On the motion of Mr. F. Liell, seconded by Mr. F. C. Lee, the report was adopted. The secretary afterwards read a digest of the rules.

A short discussion followed, the principal point being that every care should be taken as regarded the election of members; and a resolution was passed, as a recommendation to the committee, to the effect that the Institute should consist of auctioneers and surveyors only. A resolution was also agreed to electing as the preliminary council the gentlemen mentioned in the report, with the addition of the following:—Messrs. Thomas Capper, Northwich; A. E. Marwin, Cowes; G. F. Brown, Bradford; S. Hearn, Cardiff; and John Hind, Manchester. Votes of thanks to the committee and to the chairman brought the meeting to a close.

THE GERMAN IRON TRADE.



THE last number of the *Diplomatic and Consular Reports* contains one from Mr. T. R. Mulvany on the trade and commerce of the district of Westphalia. In respect of iron and steel he writes:—

The depression of prices not only continued, but increased very considerably during 1885, and still more so up to the present date, so that the present state of things is very disheartening to all those connected directly or indirectly with this so highly-important branch of industry, upon which so many branches of trade depend.

It is difficult to get at the figures, but there can be no doubt stocks have been and are increasing, so that, unless some extraordinary improvement takes place in other manufacturing countries, a still further reduction of prices in the district is apparently inevitable, although there is a fair demand in the home market; and the Rhenish Westphalian producers and manufacturers are going in for export trade, and securing from time to time large orders, more, it is to be presumed, however, for the purpose of keeping the wheels going, and for the purpose (with an eye to the future) of gaining a good footing in foreign markets than for the sake of present profits, which, under

the present state of things, are nil; in fact, I think that with regard to export trade pure and simple, the larger the orders won the greater losses. It may, I think, be safely said that without the home market prices to strike an average with this trade would simply be impossible.

There can be little doubt as to the fact that, right or wrong, in many branches of the trade, especially of the steel trade, the Germans gain orders abroad on the reputation of a superiority of quality due to the advance made in the science of manufacture in this country.

Then apart from protection and moderate land freights, it is out of the question of things that the Germans—for the reasons explained in my last report—can produce, manufacture, or construct as cheaply as the British manufacturers; but the latter are heavily handicapped in the life and death race of competition by free trade and a railway monopoly in the hands of private companies. This appears to be the only way to account for the possibility of an inland Continental district like this—with no better men and no better materials to work with—being able at any time to compete with England, where all the materials are within a ring fence close to the sea.

The Germans, it must be remembered, import foreign ores largely from over the seas, with all the expense of transhipment at Rotterdam, in many cases the same having to be transloaded into railway trucks for carriage from the Rhine to the iron-works, for which in many instances the German railway freights are still too high. There can be no possible reason why the English should not turn out as good if not better steel and iron than the Germans, seeing, as a rule, the former system of management is simpler, better, and more economic than the latter.

It is difficult to get the data for this district alone; but, judging from general statistics, there is very little, if any, increase in quantity produced, while there is a very considerable depression in the value of the products and manufactures, especially in the export trade. In pig iron I should say also, judging from general statistics, there was in 1885 less import and export than in 1884, and a very decided depression in value. Railway rails are less imported, and prices perhaps about the same; whereas export would show a considerable increase in quantity and greatly reduced value, and the same results as regards other manufactures of steel and iron. In engines, locomotives, and machinery, judging from the general state of trade and general statistics for the empire, there was less import and less export in both cases, but especially in the latter, at reduced selling value. Almost without exception, the most marked reduction in value is to be noticed in the selling value of the exports, which goes to show that those manufacturing centres which export to Germany cannot afford to, or do not, make the same sacrifice to maintain an export trade as the Germans (under the aid of protection) do and can afford to do, with the object of establishing an export trade.

Owing to this protection, the home producers and consumers, such as State railways, &c., may have to pay higher prices than under free trade, but they and the nation at large profit by increased reproductive employment, influx of foreign money, interest on capital invested (at least avoidance of loss of capital), a larger revenue from taxes and import dues, by the carriage of German raw materials and unfinished manufactures on German rail and waterways, advantages which far and away outbalance any which might accrue from the purchase at perhaps somewhat lower prices from foreigners. It must be remembered that the money expended in the purchase of home products is kept within the country.

As yet wages have not been reduced to any extent worthy of notice: in a good many cases, however, reductions of the number of hands employed have taken place, but on the whole there is no want of employment worthy of note, nor does there appear to be any discontent among the workmen, nor have they as a rule any grounds for complaint.

The wire trade has undergone a further depression: from Cologne it is reported that a further reduction of demand took place in 1885 of 11 to 12 per cent. Messrs. Felten & Guilleaume export very largely to England and the colonies not only wire and wire ropes, but cables and fencing, &c., of superior quality.

Of late years German manufacturers have established works in Russia, so as to avoid the heavy import duties levied in that country.

A new system of railway sleeper (made of old rails) has lately been patented for Germany, and I believe England, which has, it is stated by the patentee, been practically tested in Germany with very favourable results: the economy which can be effected, he says, according to calculations made, is very great as compared with any other system.

It is assumed that were this system adopted on the principal railways in Germany a saving would be effected in fifteen years of 7,500,000*l.* as compared with wooden sleepers, or an enormous economy would result even in comparison with the present light iron sleepers, seeing that the latter, it is stated,

FIRE BRICKS.

Samples and Quotations from the Manufacturer

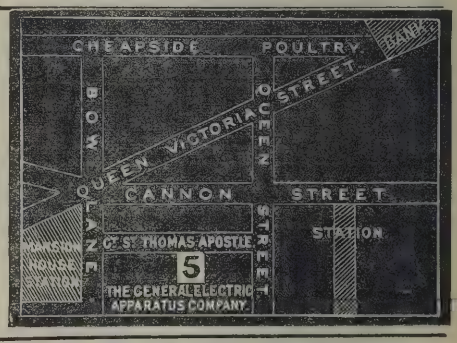
cannot be expected to have a duration of fifteen years, and that each renewal would represent a loss in value of material of 6,240,000*l.*, whereas the life of old rails, as sleepers, is taken at eighty to one hundred years. The deterioration of value of the old rails, as such, would be but comparatively small. Great advantage is claimed from the heavier weight of the rail sleeper securing a greater stability of road.

Two suitable lengths of old steel or iron rails are used in the construction of each sleeper, the only work necessary being the cutting, boring, and fitting of the same.

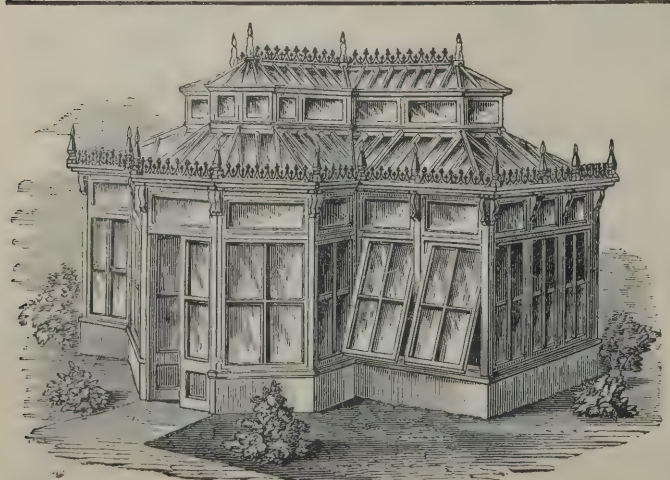
There is certainly, if good working results can be obtained, a great deal in the idea of the direct application of such old material, which must otherwise be sold at low prices, particularly in countries where iron or steel industry does not exist.

The Iron and Steel Association complains of large orders having been given by the State railways for wooden instead of iron or steel sleepers, notwithstanding the favourable results attained with the latter, and the present depressed state of the iron and steel trade.

MARBLE-WORKING MACHINERY.



WE lately described the ingenious machinery which is employed by Messrs. Burke & Co. at their Paris works for sawing blocks of marbles into thin sheets. It is a specimen of the skill possessed by Belgian engineers. It appears from a judgment in the Court of Appeal on Saturday that Messrs. Burke had ordered an English machine, but it had to be superseded. The maker of the English machine brought an action to recover the value, and Messrs. Burke objected on the ground that the machinery was unfit for the purpose for which it was made. According to the evidence, Mr. Burke in 1882 ordered of the plaintiff, Mr. Hall, two large saw frames for sawing marble into small pieces for mosaic work. It appeared that Mr. Burke ordered the machines to be on the pendulum principle—that is, that the motion should be communicated from the engine to the saw by means of a pendulum, instead of by means of a crank; and after the contract was entered into, the defendant desired that the working gear should be under the machines, and desired other alterations. The plaintiff raised objections to these, but the defendant desired them as the machines would thereby occupy less room. The contract was arrived at by letters, and what the actual contract arrived at was was a question in dispute between the parties, the principal letter from the plaintiff to the defendant describing the machine as a self-contained saw frame, with radiating water and sand plates, self-raising and self-lowering gear as described, and worked by pendulum. One of the machines was set up in London, and the other in Paris. The Paris machine seemed to have worked for a short time, and then broke down. The plaintiff alleged that the machines were well made, and that they broke down owing to the defendant insisting on having the pendulum and the under-gearing and other alterations, and by reason of the machines being improperly worked by the defendant's workmen. It appeared that sand and water ran down from the sand boxes to the gearing below; and it was alleged that the self-distributing sand boxes ordered by defendant caused an excessive strain on the machines, and that pieces of marble were carelessly allowed to get into the sand boxes, which also contributed to the breakdown. The defendant alleged that the machines, both the London and the Paris one, were unfit for the work for which they were ordered, and that the plaintiff was bound to supply machines that would do the work; that he was entitled to reject and did reject the machines, and counter-claimed for damages. The case was tried before Mr. Justice Grantham without a jury, when it occupied several days. It appeared that the London machine was set up on May 2 and did not break down until June 29, and the question was raised whether the defendant had not kept it too long to be entitled to reject it. In the result the learned judge found that the position occupied by the plaintiff towards the defendant was that of an engineer who was engaged to make a particular machine which the defendant required for carrying out, as he thought it would, certain work which he was anxious to have performed, but that the plaintiff did not warrant that the machines made by him according to the defendant's direction and with his approval would carry out the work as required by the defendant. He also found that the plaintiff's allegations as to the cause of the machines breaking down were true. Judgment was accordingly given for the plaintiff.



The defendant appealed from this judgment, and argued his case in person; while Mr. Forbes, Q.C., and Mr. Yarborough Anderson argued for the plaintiff. The arguments took place last month, and the Court delivered judgment on Saturday, partly affirming and partly reversing the judgment of Mr. Justice Grantham.

The Master of the Rolls said that the defendant had argued

OAK PANELLINGS.
A SPECIALITY.
MR. J. ICHENHAUSER, of 68 NEW BOND STREET,
Is prepared to give Designs and Estimates for OAK PANELLINGS and CEILINGS, for Sacred and Domestic Buildings. Largest holder in Europe of Queen Anne, Jacobean, Louis XIV., Louis XV., Louis XVI., English, Italian, German, and Flemish Renaissance Styles. Also Antique Carved Oak and Marqueterie Furniture. Architects and intending Builders would do well to send for Mr. Ichenhauser's Illustrated Magazine, *The Collector and Art Furnisher*, Free.

R. HOWARD,
Horticultural Works,
DONCASTER.

HORTICULTURAL BUILDINGS erected, with hot-water apparatus complete, in any part of the Kingdom, by experienced workmen. All the newest improvements in machinery for ventilation.

SILVER MEDAL awarded by the Society of Architects at the Architectural and Building Trades Exhibition, Sheffield, February 1886.

Also PRIZE MEDAL and CERTIFICATE, the highest and only award for excellency of Horticultural Buildings and Machinery for Ventilation, at the International Architectural Trades Exhibition, London, April 1886.

the case with unusual and remarkable ability. The dispute was a purely business and mercantile dispute, and there was no imputation on either side. It appeared that there was a contract between a person desiring a machine and a manufacturer of machines. The contract was made in writing, one party asking to have a saw frame made, and the other undertaking to make it for a certain price, the manufacturer knowing that it was for sawing stone or marble. There were two well-known kinds of contract—first, a customer might ask a manufacturer to make a machine according to a given plan or according to a plan supplied by the customer; in that case the manufacturer would only have to make the machine according to the plan and in a workmanlike manner. Secondly, a customer might ask the manufacturer to make a machine for a particular purpose, not supplying any plan, but leaving it to him to make it for that purpose: in that case, unless the contrary was expressly stated in the contract, the manufacturer would have to make a machine fit for that purpose. There might be a third kind of contract, where both parties said that they would jointly endeavour to make a machine that would do its business, when he thought that there would be no warranty that it would affect its purpose. Here there was a contract by the plaintiff to make the machine, not according to a given plan, but for sawing stone or marble. There was, therefore, a guarantee that it would be fit for that purpose, and this notwithstanding that the manufacturer had never made a machine like it before. After the contract was made the defendant ordered certain alterations, and it was argued that those alterations caused the breakdown. But when the manufacturer was to make a machine fit for a particular purpose, and it was left to his skill to make it, even though the customer ordered alterations, the manufacturer had a right to refuse to make those alterations, as he was responsible for the machine under the contract. If the customer were then to insist upon them, the contract would be altered, and the machine would be made according to a given plan. But if, on the alterations being suggested, the manufacturer adopted them, he could not at the same time say that the contract was altered; he had made the suggested alterations his own, and having agreed to make the machine for a fixed price, he could not charge for them, however expensive they were, unless there was an agreement to that effect. The case of a contract to build a house was different, as there the contract nearly always was to build according to a specification, and any tribunal would hold that an alteration of the specification would be an alteration of the contract. But here there was no specification on which the machine was to be built. His lordship then came to the conclusion that the machine was not fit for the purpose for which it was ordered, and that it broke down in consequence, and not in consequence of the defendant's working. The defendant had a right to keep it for a reasonable time in Paris so as to test it, and that was all he did. He did not accept the machine, and could not be made to pay for it, and he must receive back the money paid by him for its conveyance to Paris. Further, the plaintiff was not entitled to any sum for extras incurred by him in trying to make the machine work in Paris, as he was only endeavouring to carry out his guarantee. As to the London machine, the defendant kept it too long, and so must be held to have accepted it, and must pay for it; and as he put his case solely on the ground that he need not pay for it at all, he did not point out any substantial expense to which he had been put in repairing the defects in that machine, and so could not recover anything in his counter-claim in that respect. As to another machine in question, his lordship thought the defendant's complaints about it were not well grounded. The judgment would be that the defendant need not pay for the Paris machine, and would recover on his counter-claim the cost of its conveyance to Paris, but that he must pay for the London and the other machine. The general costs of the trial would be the plaintiff's, the defendant to have the cost of the issues in his defence and counter-claim on which he succeeded. There would be no costs of the appeal.

Lord Justice Lindley, in concurring, said that this contract came within the fourth class laid down in "Jones *v.* Just," "L. R." 3, Q. B. 202, that "where a manufacturer contracts to supply an article which he manufactures or produces, to be applied to a particular purpose, so that the buyer necessarily trusts to the judgment or skill of the manufacturer, there is in that case an implied term or warranty that it shall be reasonably fit for the purpose to which it is to be applied." As to the alterations, he did not think that the defendant insisted upon them, but only suggested the alterations and pressed them. The plaintiff never told the defendant that they would spoil the machine, and the fair inference was that the plaintiff saw the objections to them, but also saw his way to overcome those objections. There was no express decision upon the point; but, upon principle, he thought that the implied warranty extended to the alterations which the manufacturer had agreed to make.

Lord Justice Lopes also concurred.

LOFTS' PATENT STOVES

Will burn any kind of Coal or Rubbish, consume their own Smoke, and require only one-fifth the Fuel of any other Stove.

After four years of tedious experiments I have been able to produce what has long been required, viz., Domestic Stoves which consume only one-fifth the quantity of Coal (*One Ton instead of Five*) required by any ordinary stove, at the same time giving as great an amount of heat and more thorough ventilation. I have great confidence in recommending these to the public. Since perfecting them I have tried them for six months in the worst of smoky chimneys, and they have not failed in any one case; have shown them at work to a large number of scientific, medical, and practical men, and they have given but one opinion, which is that, as regards heat, health, and comfort they are perfection, and they have not seen or heard of anything to equal them. The fire-grate is perfectly open, like the register or slow-combustion stoves now in use; they are neat, strong, and easy to understand; will burn any kind of coal or rubbish; **consume their own smoke**; are lighted just in the same way as an ordinary stove, and draw up as quickly and as easily.

Full particulars on application.

To be seen in action at London Show-rooms, 165 Queen Victoria St., E.C., or at Cambridge.

THE GREAT QUESTION OF LOOSE BLOCKS ENTIRELY SOLVED.

BRADSHAW'S LIMMER ASPHALTE

Messrs. BRADSHAW & CO., being Sole Agents in the United Kingdom for, and possessing proprietary rights in, the Freehold Mines of the German Asphalte Company (of which Mr. C. W. Bradshaw is also a Director), situated at Limmer, near Hanover, and Vorwohle, Brunswick, possess special facilities for reliable and prompt delivery of their celebrated "LIMMER ASPHALTE" at low rates, either for sale in its natural state or ready for laying by their own workmen in any part of the United Kingdom. EACH BLOCK supplied from these Mines, besides bearing the impress of the Company, is stamped with the words "BRADSHAW & CO." The attention of Architects, Engineers, &c., is particularly called to the fact that the "LIMMER ASPHALTE" is especially suitable for use in the construction of Reservoirs, Roofs, &c., where water-tightness is extremely essential. For such purposes **Over 2,000,000 (Two Millions) of Square Feet of "Limmer Asphalte"** have been executed by Messrs. BRADSHAW & CO.; while for Paving purposes **Over 50 Miles of "Limmer Asphalte" Footways** have been laid by them in the LONDON DISTRICT ALONE. Messrs. BRADSHAW & CO. will be happy to forward Prices, Samples, and Testimonials, and give all information on application to :—

INVENTOR and PATENTEE of the

SAFETY WINDOW WITH REVERSIBLE SASHES

FOR INEXPENSIVE AND PERPETUAL CLEANLINESS,

Which has gained at the INTERNATIONAL HEALTH and SANITARY EXHIBITIONS

Two Gold, Four Silver, and Four Bronze Medals, and Sixteen Diplomas of Merit.

IMPORTANT NOTICE.

The Patentee has been advised by several of his friends to form a Company for the Manufacture of the above-mentioned Sashes in larger numbers, for the supply of the Trade and for the Home, Colonial, and Foreign Markets. Hitherto he has only supplied the Fittings, except under very special circumstances. He now proposes to manufacture the Sashes complete with Fittings.

Provisional Protection has just been granted for another Patent, whereby the Sashes will be greatly reduced in price, and, consequently, brought within the requirements of every Architect and Builder.

If any of the readers of this journal wish to receive further particulars or to take Shares in the proposed Company, they are requested to make early application to the Patentee, as it is expected that the larger number of the Shares will be privately subscribed.

Applications for Shares will be taken in the order in which they are received.

THE ARCHITECT AND CONTRACTOR'S COMPENDIUM

And Specialist's Directory for 1887.

EDITED BY JOHN E. SEARS, A.R.I.B.A., F.A.S.

An illustrated and priced catalogue and directory of specialities, manufactures, and requirements in every branch of the Building Trade, and in office and workshop, carefully classified and indexed, combined with an Office Diary, Legal and General Information, Copies of Building Acts and By-Laws, Tables, and Memoranda. Illustrations may be inserted produced by the Litho- or Ink-Photo process. In addition to the usual circulation of a first-class Annual, **the Publishers guarantee to send a copy gratuitously to every Architect and Builder whose name appears in the London Directory.** Advertisements will thus for twelve months be in a convenient and attractive form before the eyes of the people Advertisers specially desire to reach, and this **at a cost less than half that of sending out one circular.**

The minimum **guaranteed circulation** of the **Compendium** is 3,000 copies, but the actual circulation will probably reach a much higher figure.

Special attention is directed to the fact that, at great expense, the Publishers have arranged to illustrate this work by the magnificent **Ink-Photo** process, specimens of which are to be seen weekly in *The Architect*. The **Compendium** will thus be far ahead as an artistic production of any class Annual published, adding greatly to its value as an advertising medium. The Ink-Photos can be produced, **without block,** from **any** drawing or photograph, and printed in any tint. The charges are very moderate, and will be quoted on application.

An exceptional opportunity is thus afforded Country and Colonial Firms to introduce their manufactures to the London market. The Compendium will be produced in first-class style, and will doubtless become a standard work of the trade.

Prospectus, with full table of contents, &c., free on application; but Advertisements and Blocks should be forwarded at once to the Advertisement Manager, 16 New Bridge Street, London, E.C.

London: JAMES SEARS & SONS, Printers and Publishers, Crane Court, Fleet Street.

H. T. TALLACK, { 28 Hatton Garden, London, E.C.

GRUNDY'S PATENT WARM-AIR VENTILATING FIRE GRATE.

The novelty, superiority, and advantage of this patent consist in the heating surface being greater than any other Fire-grate introduced to the public. It is very simple in construction, and is made in the form of a Stove, the back of which is semicircular in shape, with gills behind and smoke-nozzle on top, all cast in one piece. The same can be attached to any design of a Register or Stove front. It is very suitable for schools, class-rooms, waiting-rooms, hospitals, offices, dormitories, and dwelling-houses, from the cottage to the mansion. Design and specification post free on application.

TESTIMONIALS.

"9 Victoria Chambers, Westminster, S.W.: June 10, 1884.

"SIR,—I have much pleasure in testifying to the efficiency of your patent warm-air fire grate. It has been very successful, and given every satisfaction where I have used it. Yours, &c.,

"To Mr. Grundy. JAMES WEIR, F.R.I.B.A."

"6 John Street, Bedford Row, W.C.:
"December 16, 1885.

"DEAR SIR,—I have now had an opportunity of testing your patent grate, and am glad to be able to say that I am most agreeably disappointed, because, as you are aware, I was rather sceptical about its powers when you showed it to me; but now I can say it answers admirably, and heats abundantly my porch-conservatory.—I am, yours truly,

"R. S. LANDER, F.R.I.B.A.

"To Mr. John Grundy."

From James Garry, Esq., Architect, West Hartlepool, July 1884.

"DEAR SIR,—I have very great pleasure in stating that the first stove, or patent warm-air ventilating fire grate, adopted by me in school at Seaton, and a second in a Cocoa Palace, have given such satisfaction that I now order eleven to be inserted in New Upper Grade Schools in course of erection at West Hartlepool. They are the most economical, efficient, and easily managed stove at present before the public.—Mr. John Grundy."

From Hon. and Rev. G. G. C. Talbot, M.A., Withington, Cheltenham.

"DEAR SIR,—You will be gratified to hear that the school is completely warmed by your new grate. It is the most economical and efficient that I have ever seen.—Mr. John Grundy."

Society of Architects, Architectural and Building Trades Exhibition, 1885:—"5 Great James Street, Bedford Row, May 1.—The warm-air ventilating grate shown by Mr. John Grundy at Stand 75 Floral Hall, is an admirable contrivance for utilising the heat conducted through the back and sides of the stove, for warming schools and buildings by a supply of freshly warmed external air."

Apply to JOHN GRUNDY, 30 Duncan Terrace, City Road London.—Works: TYLDESLEY, near Manchester.

Agent for Scotland, SEPTIMUS HARPUR SMITH, 1 Upper Gilmore Place, Edinburgh.

TRADE NOTES.

THE General Gas Heating and Lighting Apparatus Company, Limited, have brought out a large series of new designs in stoves, which not only have the advantage of the application of Mr. Leoni's patent principle for incandescent perfect radiant gas fires, but are decorated with beautifully-designed Lambeth art china. They are suitable for rooms in the highest class of houses.

OBJECTIONS are often raised against the garish and hard appearance of the gold grounds which are used in paper-hangings, and which counterbalances the effect which gold imparts. Messrs. William Cooke & Co., of Leeds, in their "golden lustre silk" papers, have got over the difficulty. The gold grounds have a softness that is suggestive of a delicate textile fabric. Whether seen by daylight or under strong gas-light, the gold ground never becomes obtrusive, while it imparts an exquisite sheen to the material. This mode of treatment is the most important of recent improvements in wall papers, but Messrs. Cooke & Co. do not depend on it alone for success. The patterns printed on the ground are all admirably designed.

THE revival of polychrome decoration has made coloured marbles a necessity both for outdoor and indoor work. The facilities of communication have allowed modern architects to have as wide a range of choice as their Greek and Roman predecessors. It is well known that Rome was indebted for much of its magnificence to the beauty of the African marbles. After being closed for centuries several of the quarries were lately rediscovered by Signor Del Monte, and the English authorities in Northern Africa have borne testimony to the extreme beauty of the marble. Mr. Ruskin was enchanted with one of the slabs. Apparently there is an almost inexhaustible supply. A company has been organised to work the quarries, and among the directors is Mr. C. J. Phipps, F.S.A. There could hardly be a more opportune time for starting a company to work a decorative material of so much value, and from the cheapness of production and transit the sales ought to be exceedingly remunerative.

THE special Christmas number of *Bric-à-Brac*, issued by Mr. J. W. Palmer, contains amongst other matters some hints to collectors concerning rare stamps, in which is found much information that will be useful to collectors. The "History of Postage Stamps" gives further useful and interesting details. Collectors have always to be on their guard, but, notwithstanding, it is no uncommon thing for spurious articles to be passed off as genuine, and anything that can assist the collector in avoiding this danger is welcome.

A MEETING of the Birmingham Philosophical Society was held on Thursday last week. Mr. Thomas Turner read a paper on "The Hardness of Metals," and showed a new apparatus for determining the relative hardness of metals, more particularly those used for chemical purposes. The method of determination by that instrument, he explained, was by scratching with a weighted diamond, the harder the metal the heavier being the weight. In steel rails, he remarked, the true hard-

The Celebrated "DUBOIS" Hydraulic Drawn Lead TRAPS and BENDS.

The above Shapes and Sizes always in Stock, and we are prepared to furnish SPECIAL SHAPES to order at short notice. These justly celebrated TRAPS are made from Pure Pig Lead by Hydraulic Machinery after the manner of Lead Pipe, and have peculiar advantages appreciated by every Plumber. They are greatly superior to either Cast or Hand-made Traps, as they have no SEAM, are of UNIFORM THICKNESS, PERFECTLY SMOOTH INSIDE AND OUTSIDE, and can be FLANGED, PLUGGED, and STRETCHED, without fear of SPLITTING. No possibility of Sandholes.

FOR PERFECTION OF MANUFACTURE THESE GOODS ARE PRE-EMINENT.

For Sale generally by the principal Lead Merchants and Wholesale Dealers in Plumbing and Sanitary Appliances throughout Great Britain and Ireland.

London Office and Works :—15 BRITANNIA STREET, KING'S CROSS, W.C.

ness did not vary, as was commonly supposed, according to the tenacity, and that accounted for the difference which was often seen in the wear of railway rails. He also pointed out that in cast iron the softest metal was really the strongest, contrary to the common belief.

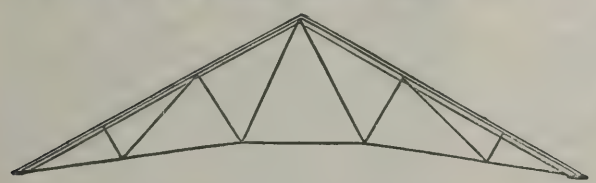
MR. JOHN CLUTTON, of London, the umpire appointed by the Board of Trade, has recently made his awards in the cases of Mr. John Gillbanks, of Wythburn, and Mrs. Hall, of St. John's Vale, Keswick, the owners of land and stints adjoining Lake Thirlmere, which are required by the Manchester Corporation for their Thirlmere Water Scheme. In the case of Mr. Gillbanks, where the claim made amounted to 25,000*l.*, the award is 13,000*l.*; and, in the case of Mrs. Hall, where the claim made was 2,500*l.*, the award is 1,360*l.* The cases, which were heard at the Surveyors' Institution. London, were conducted by Mr. Pember, Q.C., on behalf of the Corporation, and by Mr. M'Intyre, Q.C., on behalf of the claimants.

GERMAN AND BRITISH TRADE IN BRAZIL.

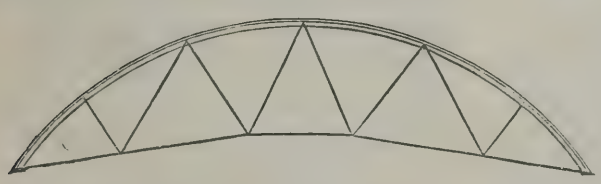
THE following information on the subject of the causes of increase of German trade in Brazil at the expense of British trade is extracted from a report dated October 25 last by Mr. W. H. D. Haggard, Her Majesty's Secretary of Legation at Rio de Janeiro :—

I see no reason to alter the opinion I have on various occasions expressed as to the growth of German at the expense of English trade in this country. I do not mean to say that British trade is declining. It is not, it is rather increasing in bulk, but, particularly in the southern provinces, German competition has so decreased the price of English goods that they hardly pay the merchant and the manufacturer for the greater cost of production in England as compared with Germany.

This, as far as Brazil is concerned, constitutes the so-called depression of British trade. Of trade there is plenty, but it does not pay. Not so with German goods. They are produced at far less cost than British manufactures ; they are not as good or as durable, but they are more showy and catch the Brazilian eye. Add to this that the German trader is now more energetic and pushing, more industrious, more economical in his personal habits and in his mode of conducting business, and, moreover, content with smaller profits, and it will be seen why he makes what is to him a fortune, while the British merchant who goes on his old "humdrum" way changing nothing, save the price of his goods, or even not changing that, fails or goes away altogether, or makes a bare livelihood where he used to make a fortune.



The Englishman has a further difficulty to contend against in the falsification of English trade-marks, which affects him very severely in this country. This is, however, a mere item, and the fact is, I think, indisputable, that the main causes of British depression in trade are those which I have enumerated.



A very striking instance of the failure of British trade to supply the want of this country is to be found in the fact that Antwerp is now almost, if not quite as much the headquarters of the royal mail steamers, which trade with this country and the Plate, as is Southampton. They there tap the German and Belgian trade, and the manufactures of these countries form a very considerable, if not a chief part of their cargoes outward bound.

The captain of one of the steamers belonging to Messrs. Lamport & Holt, which have been for the last seven years running between Rio Janeiro and Porto Alegre, one of the most rising commercial ports in this country, told me that the foreign trade there is practically in German hands, and that during his experience the amount of German goods carried by his ship has increased from an average on each voyage south of 20 tons at first to 250 tons at present, or in the ratio of 1,250 per cent.; while that of English goods has only increased from 40 to 150 tons, or in the ratio of little more than 250 per cent. These figures speak for themselves, and bear out the remarks I have ventured to make, that while English trade is increasing in bulk, German trade is doing so much faster.

A circumstance has come to my knowledge which is perhaps more alarming, as affecting the future interests of English trade here, than anything of which I have previously heard. Hitherto the German has only contended with us in articles of clothing, stuffs, &c. ; now he threatens, he has begun, to invade us, not unsuccessfully, on ground where we, too confident, thought ourselves unassailable. The agent of a German company contracted for the supply of Bessemer steel rails to the "Itapemirim railroad." The same firm wished to tender for the locomotives required. The railroad company wished to have Baldwin's (American) engines. These locomotives cost about 1,800*l.* each. The German agent offered to supply as good a locomotive for 1,150*l.* each, but the railway company would have nothing but Baldwin's engines. The German agent then offered to let his

COLES, STEWART & CO.,
STOCK AND SHARE BROKERS.

Messrs. COLES, STEWART & CO. undertake every description of Stock Exchange business, and have special and early information on all leading Stocks; they are also continually advised by telegram from the chief Mining centres, both at home and abroad. For Investment Messrs. C., S. & Co. make only one charge of $\frac{1}{16}$ per cent. commission on all descriptions of Stocks, and open Speculative accounts with from 1 per cent. cover and upwards, without any further risk or liability to their clients whatever.

THUS, £5 commands £500 Stock; £10, £1,000 Stock; £50, £5,000 Stock;
And so on to any amount.

In the transaction of speculative business Messrs. C., S. & Co. make no charge for commission or brokerage whatever unless their client makes a profit, when they take 5 per cent. of the profit made as their remuneration.

All transactions advised by wire as soon as completed. Monthly Circulars and Mining Reports post-free on application.

COLES, STEWART & CO., St. Stephen's Chambers, LONDON, E.C.

engine run for twelve months without payment, and agreed to take it back if it did not prove satisfactory.

It is a most significant fact that during this contest there is no mention of any English firm making any tender, and whilst this instance proves the energy of the German agents, and how hard they are working to get a footing for their machinery in Brazil, it also proves the want of energy of the British contractor and manufacturer.

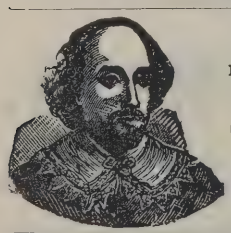
As is well known, there exists a European syndicate of iron-founders, who have agreed not to deal below a certain fixed figure. Each firm belonging to that syndicate engages, while pushing his own business to the best of his ability, not to interfere in any transaction which is being negotiated by any other member of the syndicate.

It follows *cæteris paribus* that those firms which have the best agents do the most work. The German firm in question was, I am informed, a member of this syndicate, to which the leading English firms also belong; they had therefore an equal chance with the German company of obtaining the contract; as they did not do so, it would appear that the German company was the better served by its agents. Perhaps, however, the most striking instance of loss to an English firm, through want of energy or failure to recognise the signs of the times has lately occurred in this city. An English company has for years had the monopoly of the gas supply. Their contract coming to an end, the Brazilian authorities offered to renew it to them on more favourable terms (to the town). The English company demurred for some time, when suddenly the question was decided for them by the contract being given to a Belgian company; and I heard the other day, on what I cannot but consider as very good authority, that this company had cleared 10,000*l.* profit in the first month.

These changes, then, are not due, I believe, to any special protection on the part of German or Belgian officials, or to any want of such protection on the part of British diplomatic or consular agents; they are simply a natural effect of a natural cause, which can only be removed or alleviated in a natural manner. Let the British ironmaster or other trader, now that he has not, as he formerly had, the command of the market, show the same energy as his German or other foreign rival. Let him be content with smaller profits; let him manage his house and stores here, and as far as possible his manufactories at home on strictly economical principles, and he will do far more himself towards holding his own than can be done for him by diplomatic or consular fostering or protection.

BRIDGE AT TROLLHATTAN.

THE Consul at Stockholm has forwarded to the Secretary of State for Foreign Affairs the following translation of an advertisement in the *Göteborgs Handels och Sjöfarts Tidning* of December 6, 1886:—"It having been decided to build a bridge across the river Gotha at Trollhättan, for which the Government have granted an allowance, the committee of management hereby request intending competitors to send in offers before the expiration of the month of December, separately for the bridge and separately for the foundation, according to drawings and specifications. Solvent guarantee or other approved security must be given for the completion of the work. Offers are received by and necessary information given upon application to the chairman of the committee of management, Ernst Stridsberg, civil engineer, Trollhättan."



THE MANCHESTER SHIP CANAL.

AN influential meeting, convened by the Mayor, and including many of the leading citizens, was held on the 9th inst., in the Manchester Town Hall, to receive the report of the Independent Consultative committee appointed to investigate the Manchester Ship Canal scheme at the time the Company failed to obtain the capital they asked for through Messrs. Rothschild. The Mayor (Mr. Alderman Curtis) presided.

The ex-Mayor (Mr. Alderman Goldschmidt), in presenting the report, said the committee were entirely outside the Ship Canal Company. An exhaustive inquiry had been made, and the committee were unanimously of opinion that the undertaking was a sound one. The committee in their report stated that they had undertaken the inquiry under a strong sense of public duty, and with the sole desire and aim of arriving at a correct judgment upon the merits of a scheme the failure of which, supposing it to be commercially sound, would be a public calamity. The men composing the committee pretended to no authority beyond such as they might derive from their personal knowledge of the trade and commerce of the district. Not one of them entered upon the inquiry with his mind made up, and many of them did so with opinions adverse rather than favourable to the scheme. If in the result they had been led with

Designs and estimates on application.

unanimity to the conclusion far more favourable to the project than they could have anticipated, it was, they believed, only because a similarly exhaustive inquiry would produce the same effect upon the minds of others who might undertake it. Their conclusions were as follows :—

1. That the ship canal and works are practicable from an engineering point of view, and would permit vessels of the largest class to be safely navigated to and from Manchester. 2. That the canal and works can be completed ready for traffic at a cost within the estimate of £5,750,000, and that the sum of £802,936 set down for the purchase of the land is a sale estimate. 3. That the canal and works should be constructed under a contract, fixing a maximum sum in order to prevent any possibility of the estimates being exceeded. 4. That graving dock accommodation should be provided, and be ready for use on the opening of the canal. 5. That the estimate of £105,300 per annum of the expenses of the working and maintenance is ample. There would probably be a material saving on this item during the first few years after completion. 6. That the acquisition of the Bridgewater undertaking at the sum of £1,710,000, fixed by the Act of Parliament, would be an advantageous purchase for the Ship Canal Company, and that the present average net income of £60,000 would, after the completion of the works, continue to be derived from the Bridgewater Canal and those other portions of the Bridgewater properties not required for the construction of the ship canal. 7. That the capital powers of the Company under their Acts of Parliament, amounting to £9,812,000, are sufficient for all the purposes contemplated by their Acts. 8. That the project is a thoroughly sound commercial undertaking, and would speedily become remunerative on the completion of the works, and that a large amount of traffic would at once be secured, and that thereafter the increase in traffic and revenue must be steady and continuous. Having regard to the responsible character of this report, we feel it our duty to state that in our judgment it is necessary, before the issue of any further prospectus, to reconstitute and greatly strengthen the board of directors.

The report was signed by Alderman Goldschmidt (chairman), Mr. C. Moseley (deputy chairman), Lord Egerton of Tatton, and twenty other gentlemen who formed the committee. The report also contained the grounds upon which the committee based their conclusions. They attached great importance to the fact that the canal, throughout the whole length of thirty-five miles, could be made available for the purpose of a dock for vessels of all sizes, and that industries, tempted by the certainty of cheap access to the sea, must spring up on its banks and yield a good revenue in tolls to the canal. They estimate that during the second year after the canal and docks are open, there is a reasonable prospect of securing a traffic which would produce a net income of £479,430, and would be sufficient to pay a 5 per cent. dividend upon the whole share capital of the Company (£8,000,000), leaving a surplus of £79,430. Their estimate of traffic for subsequent years was much larger, and pointed to the undertaking becoming increasingly remunerative under capable administration.

Mr. Daniel Adamson, chairman of the Ship Canal Company, thanked the committee for their services, and said that he was convinced they only wanted to make the subject thoroughly understood, for this scheme had behind it a paying power that the great porter brewing firm in Dublin never would possess, and, unfortunately, when the shares were put into the market, sufficient time was not allowed for them to be taken up.

Mr. Jacob Bright, M.P., said that if, after that meeting, there was no great result, one might say that the enterprise of Manchester was coming to an end. The meeting then terminated.

THE LATE MR. ROBERT ROBSON, BUILDER.

IT is with the deepest regret, says the *Durham Advertiser*, that we announce the decease of Mr. Robert Robson, at the ripe old age of eighty-two years. The deceased gentleman was a native of Lumley, but after receiving his education came to Durham, and was apprenticed to Mr. Matthew Wardle, joiner and builder. Mr. Robson, however, was not slow to take advantage of the large business aptitude with which he was endued. He thus commenced business on his own account as a joiner and builder, and soon formed extensive connections in this particular line, in fact it may be said that deceased, together with his son, the late Councillor Henry Robson, who was in partnership with him for many years, were entrusted with most of the principal contracts in this part of the county. But perhaps Mr. Robson's public career is best known to the older citizens of Durham, for he was connected with the corporation during the period of the town's greatest progress, and was instrumental in devising many of the reforms and improvements which have had such a beneficial effect in late years. Deceased was first elected a member of the

corporation as a councillor for St. Nicholas' Ward in the place of Mr. Robert Tiplady. He was also re-elected for the same ward on November 1, 1853, 1856, and 1859, and on November 9 of the latter year he was elected to the aldermanic dignity, in the vacancy, we believe, caused by the promotion of Mr. John Bramwell to the Recordership. Mr. Robson was re-elected an alderman in 1865, 1871, and 1877. In the meantime, however, the zeal and activity which he had displayed in the conduct of municipal affairs recommended him for the distinguished position of Mayor of Durham, and on November 9, 1858, he was elected to the civic chair, a position which he also twice afterwards occupied, namely, in 1866 and 1867. On November 9, 1883, Mr. Robson, through ill-health, was compelled to sever his connection with the Corporation; but this was not allowed to take place without his fellow-citizens showing their high appreciation of his public career, for in February, 1884, he was presented by the Council with an illuminated address. Mr. Robson was also a trustee of Smith's Charity, and a Justice of the Peace for this city, having been added to the Commission in May 1860. Deceased was a prominent member of the Wesleyan body in this city, having filled during his lifetime almost every lay position connected with that body. Mr. Robson leaves one son (Mr. E. R. Robson, architect) and three daughters.

THE PLUMBERS' COMPANY.

THE registration of plumbers proceeds apace. Again we publish a long list of names and addresses of master-plumbers and journeymen who have qualified themselves for registration, either by supplying satisfactory evidence of their experience or by passing a practical examination. The architects have been well represented in their support of the movement to improve plumbers' work from its very outset. Mr. E. I'Anson recently stated the architect's interest in the subject very practically when he said:—"Of course architects are only designers. They endeavour to design the most perfect buildings they can for all classes, but they are dependent upon the artificers to carry out the work, and without good workmanship the efforts of the architectural profession cannot be successful." This statement of the case may be considered almost too trite for notice. But, nevertheless, its importance is not to be exaggerated. The public will always hold architects more or less directly responsible for the complete efficiency of their buildings; therefore, on the lowest grounds, it is obviously the interest of the profession to take every opportunity which presents itself for promoting the technical training of craftsmen, and particularly the better education and registration of plumbers, whose shortcomings and scamped work are undoubtedly the most prolific of all the causes of trouble and dissatisfaction which arise between the owners of property, the general public, and architects; and therefore all have an inducement to encourage the efforts of the Plumbers' Company, and give the preference to registered over unregistered men.

THE RISKS OF COVED CEILINGS.

THE adjourned inquiry into the circumstances attending the death of a workman who died from injuries received by the fall of a portion of the new bathing establishment, was held last week in the Guildhall of Bath.

The following report of the proceedings is taken from the *Bath Herald*:—

Major C. E. Davis, F.S.A., the City Architect, first read the following statement of his evidence:—The coved ceiling, forming a roof of the Aix Douche, is coved in order that condensed vapour from the douche shall not drop, but follow the slope of the curve. The ceiling was constructed in this way for the purpose above stated, and not as an arch for the purpose of strength. The arch, as it was constructed, would, when thoroughly solidified, be self-sustaining, that is to say, abutments would be quite unnecessary. The theory of arch building assumes that the voussoirs, or wedge stones of the arch, are held together by gravitation, without the assistance of any adhesive matter, such as mortar or cement. The arch or ceiling that has fallen was constructed of concrete and cement brickwork, and is one solid mass, and would have sustained itself and any ordinary weight likely to be placed on a roof. I was on that portion of the scaffolding between November 4 and November 12, when I made some alteration in the curve of the centering. Although (with two exceptions) I was on the building every working day between November 12 and November 25, I did not go to the north-east part of the scaffolding until Thursday, the 25th, the day before the arch fell, when I walked on the top of it. On November 17 I measured the dressing-rooms adjoining the douche, in order to get an estimate for the

VOLUME XXXV. OF THE ARCHITECT.
Handsomely bound in Cloth, Gilt Lettered. Price 12s. 6d.
OFFICE: 175 STRAND, LONDON, W.C.

Registered Trade Mark.

TO ARCHITECTS, CONTRACTORS, AND BUILDERS.
SAVE ONE-THIRD of COST and TIME in your PRIMINGS by using
KALLKOLITH.
IT produces an exquisite smoothness, and amalgamates thoroughly with WOOD, STONE, IRON, CEMENT, PLASTERING, &c. IT is less than HALF the WEIGHT, and IT goes further than three times the same quantity of ordinary priming. IT has to be thinned with two parts of water for use on Stone, Cement, and Plastering, and with seven parts of water for Smoky Ceilings and for preparing Walls for Colouring and Paper Hanging. IT dries in from ONE to TWO hours, effecting a great SAVING in TIME. IT lasts longer and better than any other priming known, and prevents Blistering.
Price per Case of Eight Tins of 14 lbs. each, 40s, packing included. Sample Tins, 6s. each.
H. RANSOM & CO., 11 Queen Victoria Street, LONDON, E.C.
Agents wanted in every Town in the United Kingdom and Colonies.

Registered Trade Mark.

floor, and the ceiling of the Aix Douche was then in position. I fix this date by a variety of circumstances. I have read the evidence given by Mr. Wilcox. I am willing to accept his figures, but I do not admit his conclusions. Let the weight of the arch, therefore, be taken at 7 tons, and the weight of the east wall at 3 tons 9 cwt., or 1 cwt. less than half the arch; but as a perpendicular weight on the wall equal to two-thirds that of the half arch (namely, 2 tons 6 cwt. 75 lbs.) would maintain it in equilibrium, there remains something more than a ton (namely, 1 ton 3 cwt. 37 lbs.) to make the arch doubly secure, so that there was an immense margin of support to secure the stability of the fabric. I do not, however, rest all my strength on this calculation, because I assume that this roof, when ultimately consolidated, would have no outward thrust to resist, and would therefore need no extra support from side walls or tie rods. The unusual height of the arch arises from the exceptional condition to be contended with, a sufficient space being required to allow free circulation for the vapours from the hot waters, so as to mitigate their disagreable effect. With reference to Mr. Wilcox's suggestion that the fact of my residence being near the scene of my labours imposes on me the responsibility of examining the arches before the centerings are struck, I wish to say that an architect's duties in this respect are clearly defined and well understood, and are quite irrespective of the distance of his house from the work which he has designed; and the question of the juryman, "Whether it was the architect's duty to examine the walls before the centering was struck," can only admit of a plain answer, "Yes" or "No"—it cannot admit of an answer which faces both ways. On looking over a number of specifications by the leading architects, I have not met with a single instance of any such condition imposed on the architect; but even if such condition be general and usual, it certainly does not exist in my specification.

The Coroner: You say abutments would be unnecessary; was that supposing the arch was resting flat at each end?—The thing itself would be like an umbrella, it would be self-sustaining.

And abutments as a means of counter support would be unnecessary?—Quite so, that is if it were solidified.

Would that be so when the arch was resting on a skewback?—That does not apply.

I can understand its giving a downward pressure directly, if there were no slanting skewback. Supposing the centres were removed when the binding between the skewback and the arch itself was not solidified, would there not be of necessity an outward pressure?—I cannot give you an opinion. I am only explaining my construction, which I take to be solidified.

Would there be an outward pressure?—That would be counteracted by the weight of the wall exceeding the weight of the arch.

The superior weight in this case would have more than counteracted any thrust?—Quite so.

Did you, in your designs, calculate for one ring of bricks?—I had in my specifications two courses of lock bricks.

The clerk of the works stated one ring of bricks?—Two. I have got the specifications here.

What do you mean by lock bricks?—They are hollow bricks, and would be rather lighter.

And would the quantity of cement required for binding these together be less?—Rather more.

Would that lightness then be counteracted?—Well, in a degree. I thought it was better work using these bricks, or I should not have consented to the alteration. At any rate, it was more expensive.

It was brought to your notice and adopted by you?—It was suggested to me that the contractor was quite willing to put vitrified bricks, and I approved of it.

The calculations you have now made are made upon the present state of things?—Yes.

A juryman (Mr. Ruddock) said he thought they ought to have the specifications before them, but he supposed as Major Davis was there it would answer the purpose.

Major Davis: I have the specifications here.

Mr. Ruddock: I should like to ask Major Davis if he considers the wall was built in accordance with specifications?—Witness: Yes.

Mr. Rud dock asked whether the wall was properly bonded? There was a casing of bricks, then about three parts rubble, with no bonding from the ashlar. To be thoroughly bonded it should be bonded right through the ashlar, rubble, and bricking.—Witness: It would then be partly a brick wall, if the bricks were to go right through.

Mr. Ruddock said some of the jury went on the building yesterday, and they thought if there was any blame anywhere they should put it on the right shoulders.

The Coroner: You are quite right.

Major Davis: It is impossible to bind a brick wall casing into a stone wall. The brick would go through the face of the stone wall.

Mr. Ruddock: It struck me that it was only semi-bonded.

Major Davis: You will find the stone in one place bonded into the brick wall.

Mr. Ruddock: I saw that by the window.

Major Davis: I have no fault to find with the work in any way.

The Foreman: You think it has been carried out according to the specifications?—Witness: It is a splendid bit of work.

The Foreman: But, as my friend Ruddock asks, where are the bonders? Witness replied that there was a difficulty about it, having a brick casing to the wall, which was essential in this case. To be properly bonded a wall should be of brick and stone, or stone alone.

The Foreman asked whether in this case there ought not to have been a bond right through?—Witness: No, certainly not.

The Foreman: In all the building I have done I have put in the bonders.

Supt. Berry: If you don't behave I shall have to clear the court.

The Foreman: In all the building I have ever done I have put in the bonders from the face to the inside.—Witness: Yes, but the stone would under those circumstances come through the brick wall?

The Foreman: Yes, sir.—Witness: But that is not my intention in this case.

The Foreman: Will you give us your idea of why this wall fell down?—Witness: There are so many reasons, you know. There are so many different theories. I would not put forward one view more than another as to how it fell. There are a great many ways in which the wall might have fallen.

The Coroner: I think the Foreman asks your opinion. Perhaps you will give your opinion?—My opinion is, as far as I can judge, that there was not sufficient care exercised in taking down the centres.

The Foreman: Referring to this wall again. In my examination, with my brother jurymen, it appeared to me like three walls. First there was a casing of 5-inch or 6-inch ashlar; then you have the inside 4½-inch brickwork, filled up with rubble. Of course that is properly done, so far as I am able to judge of it, yet there are three distinct walls, ashlar, rubble, and brickwork, with no other bond except that the stones in the windows are tied together.—Witness: I told you that I did not go much on that particular portion of the building. There is the clerk of the works; it is left to him because I have a great deal of other work on the other part of the building. Therefore I could not see to that part much. From the 12th to the 25th I was only once there.

The Foreman: Give us your opinion why the wall fell down. If it was not from the thrust, nor from the weakness of the wall, give us your superior opinion as to why it fell, if you please?—Well I can only give you one reason. There may be other reasons, you know.

The Coroner: The fact is it fell?—It is quite clear that it did fall.

The Coroner: You are as likely as anyone to be able to give us a true reason.—Witness: It would not have fallen from the way in which the building was constructed. My impression is that it fell in consequence of the work not being solidified. I believe that was the reason.

The Foreman: You really cannot give us any reason beyond that of the wall not being properly solidified?—The fact is—there is no doubt about it—the wall had not properly hardened.

Replying to a remark by the Coroner, the Foreman said the wall was like placing three boards together. They would have no power, but if they were all nailed well together they would be much stronger and able to resist pressure.

Major Davis said it was very difficult to define what was properly bonded and what was sufficiently bonded. He considered this was sufficiently bonded. He knew it was thoroughly good work, and he was satisfied that no work in Bath had ever been executed better.

The Foreman asked if Major Davis said the arch was self-sustaining, how did he account for the wall falling beyond the taking away of the centering?

Major Davis: I am only answerable for the arch being self-sustaining, or constructively correct when solidified. I have nothing whatever to do with it in progress of building. Of course it has fallen, there is no doubt of that.

A juryman asked if Major Davis thought that a wall carried up in the same way would be able to carry an arch without tie rods.

Major Davis: Yes. I should not use tie rods. I have an objection to them. I shall do it in the same way again.

A juryman said the clerk of the works stated that the cement would set in twenty-four to forty-eight hours.

Major Davis: He is quite correct.

The juryman: Then how do you reconcile that with the statement that the arch was not set or firm?

Major Davis said the brickwork did not constitute the whole

Harness' Electropathic Belt.

of the arch. The work was two feet thick at the haunches, and it was clear that part was not consolidated perfectly, because it came down and was carted away.

A juryman asked how long Major Davis thought it would take for the wall to get solid?

Major Davis said in dry weather it would consolidate in a week or ten days, but in such weather as they had had, and in such a position, he should not like to say, and with the experience of the wall falling. Of course he should work with experience now. The wall was built in a continuous steam; the air was fully charged with moisture in that particular place.

Mr. Redford, the clerk of the works, was called, as the coroner wished to ask him one or two questions, but he was not in court.

The Coroner then proceeded to sum up, and, after an exhaustive review of the evidence, said that they had the fact that the arch was placed near the top of the wall, that it was constructed in the usual way over what was known as centering. It was said it was intended that the arch, when the centering was removed, should act in great measure as a beam; but it was obviously impossible that it could wholly act as such because it was not designed to rest quite flat upon its ends; it was to rest on the wall. So soon as the centering was removed there was of necessity an outward thrust, with the result that part of the east wall gave way. There was no collapse on the west side, because the resistance there was good and sound, as there were reversed arches there. Why did the east wall give out? Was it because it was not sufficiently set and so not acquired its proper strength, or was it because it was not of sufficient substance to resist the pressure upon it? Upon this point they had heard Mr. Davis's evidence, and in looking for an answer to this question, they also had the evidence of Mr. Willcox, who told them that the wall was just strong enough to resist the thrust if set, and that the cause of the fall was that it was green. That was his reason why it collapsed, coupled with the fact that the arch itself was green. With regard to the removal of the centering it appeared from evidence that Mr. Long and the clerk of the works jointly, and either explicitly or tacitly, consented to and directed this removal. The workmen who actually did the work had every right to consider themselves perfectly safe in doing so. There was no contributory negligence on their part; nor was that a matter which they had to consider. What they had to consider was, who took upon themselves the responsibility of the removal of these centres, and were they fairly and reasonably justified in doing so, taking into consideration all the circumstances and surroundings of the case—the length of time the wall had been up, and also the circumstances which had been mentioned, the vapour from the baths, and the wet weather. If they considered that such precautions were not used as might and ought to have been used—precautions that would be warranted by experience—then he asked the jury to consider whether such want of prudence on their part amounted to gross and culpable neglect of duty, not forgetting that a thing might be in itself highly reprehensible, and yet at the same time not amount to such culpable gross neglect. To assist them to come to a proper conclusion it might be well to look at the matter from the reverse side of the case, namely, what might be considered an accident, and what did not amount to such culpable gross neglect as he had pointed out. What was accidental? A result was accidental when the act by which it was caused was not done with the intention of causing it; when its occurrence as a consequence was not so probable that a person of ordinary prudence ought under the circumstances in which it was done to have taken reasonable precautions against it. Of course it was necessary in considering whether the matter was or was not accidental to judge of each particular case according to its own merits entirely. He then asked the jury to consider their verdict.

The jury retired, and after an absence of thirty-five minutes returned into court, when the Foreman read their verdict as follows:—"We find that the deceased William Mortimer met his death accidentally through the falling of the arch at the New Baths, owing to the east wall of the building not being of sufficient strength or thickness to resist the thrust, and the jury are further of opinion that it would be unsafe to construct another arch on the same wall. We agree to exonerate the contractors from all blame."

The Coroner: I am afraid I cannot record that rider as a part of your verdict; it is simply a matter of opinion.

The Foreman said he had no doubt it would appear in the papers that they had expressed their opinion very strongly on that point.

After a pause, a juror (Mr. Ruddock) said the jury would like to know on what grounds the rider was left out.

The Coroner said it was a matter that related to something in the future and not to that man's death. It was a mere expression of opinion as to a future event, and did not relate to the case into which they had to inquire. It would no doubt be taken notice of in the papers, but he could not attach it to the record of their verdict.

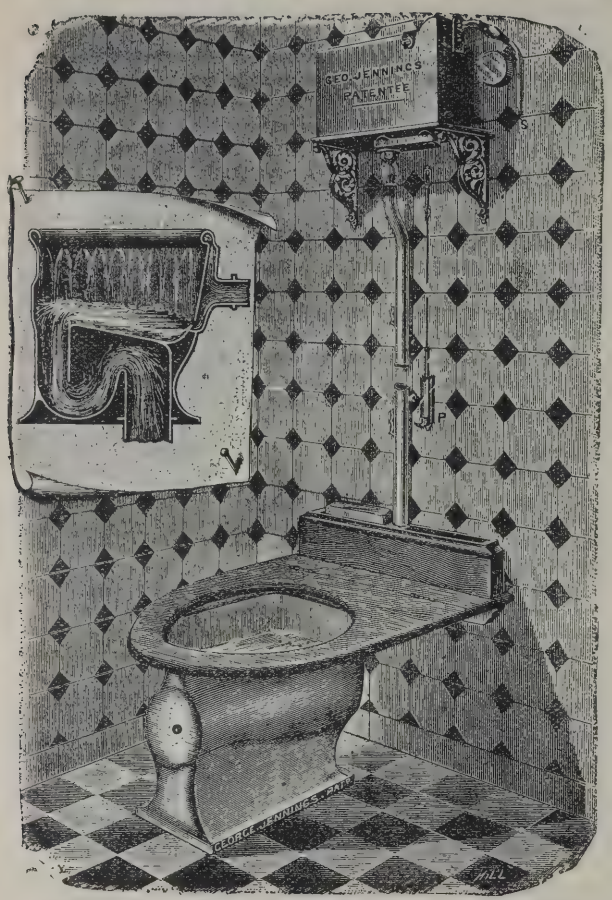
LOFTS' PATENT STOVES



Will burn any kind of Coal or Rubbish, consume their own Smoke, and require only one-fifth the Fuel of any other Stove.

After four years of tedious experiments I have been able to produce what has long been required, viz., Domestic Stoves which consume only one-fifth the quantity of Coal (*One Ton instead of Five*) required by any ordinary stove, at the same time giving as great an amount of heat and more thorough ventilation. I have great confidence in recommending these to the public. Since perfecting them I have tried them for six months in the worst of smoky chimneys, and they have not failed in any one case; have shown them at work to a large number of scientific, medical, and practical men, and they have given but one opinion, which is that, as regards heat, health, and comfort, they are perfection, and they have not seen or heard of anything to equal them. The fire-grate is perfectly open, like the register or slow-combustion stoves now in use; they are neat, strong, and easy to understand; will burn any kind of coal or rubbish; **consume their own smoke**; are lighted just in the same way as an ordinary stove, and draw up as quickly and as easily.

Full particulars on application.

To be seen in action at London Show-rooms, 165 Queen Victoria St., E.C., or at Cambridge.

"THE PEDESTAL VASE,"
JENNINGS' IMPROVED W.C. APPARATUS

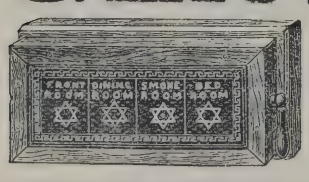
(Combination Urinal and Slop Sink).

Registered No. 16,300.

A PORCELAIN VASE set on a tiled or mosaic floor, within walls or a dado of glazed tiles. The usual wood framing, forming a storehouse for the retention and accumulation of *damp*, *dirt*, and *disease germs*, with the joints, crevices, and imperfections in work which the closet enclosure so often conceals, is entirely abolished. The seat is hinged, permitting free access for use as a *slop sink* or *urinal*, and for cleansing, so that the entire apparatus and space can be freely washed down. For this latter purpose the floor should be slightly sunk, and laid to fall to a grating, with waste carried through the external wall, and terminating in a copper flap valve to prevent draught.

☞ The suggestions as regards wall linings and floor, may, of course, be modified as best adapted to the building in which the closets are used; and in the consideration of such details, alternative schemes will readily present themselves.

At the recent **HEALTH EXHIBITION** (South Kensington, 1884), amongst a series of official tests, under the supervision of Baldwin Latham Esq., C.E., and the Jury No. 9, Class XXIII., and successfully withstood by this closet, the following may be cited in evidence of its efficient action. Being fixed in position shown in illustration, with **"JENNINGS' PATENT SINGLE FLUSH WASTE-PREVENTING SYPHON CISTERN"** 5 feet over, with 1½ inch down pipe, ten apples (averaging 1¼ inch diameter) and a flat sponge about 4½ inch diameter were thrown into the basin. The water, as well as the whole of the exposed or dry surface, was first blackened with plumber's "smudge," and the sides covered by four pieces of thin sanitary paper, which adhered closely to the soiled surface. The handle of the cistern was then pulled, and the two-gallon flush liberated. After seven seconds (the time occupied by the discharge), a receiver placed under the trap outlet was removed, containing in the blackened water **the ten apples, the sponge, and the four pieces of paper,** no traces of the soil remaining visible upon any part of the apparatus.



GOLD MEDAL AWARDED.

THESE CLOSETS are already in use in Hospitals, Banks, Hotels, Offices, Private Residences, &c., with most satisfactory results, and, fixed in the manner described, in appearance and action leave nothing to be desired. By the novel arrangement of the supply to Basin, as shown in the sectional sketch annexed, the whole surface is well flushed and cleansed, whilst the bottom of Basin and Trap are thoroughly scoured by a concentrated rush of water which insures the **instantaneous removal** of the contents, thus overcoming the inherent defects in the many imitations recently produced of **"JENNINGS' MONKEY-CLOSET"** (the **original form of wash-out watercloset**), which was invented and patented by G. J. in 1852.

A Business Supplement

The Contract Reporter.

to The Architect.

LONDON, DECEMBER 24, 1886.

TENDERS, ETC.

*** *As great disappointment is frequently expressed at the non-appearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the office, 175 Strand, London, W.C., not later than 5 p.m. on Thursdays.*

Correspondents, when writing to notify an extension of time, or an alteration of the date of sending in Competitions or Contracts, are requested in their letter of advice to write at the head of the required change—"Contract Reporter to THE ARCHITECT."

EDITORIAL NOTICES.

The authors of signed articles and papers read in public must necessarily be held responsible for their contents.

No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.

Correspondents are requested as much as possible to make their communications brief. The space we can devote to Correspondence will not usually permit our inserting lengthy communications.

Preston's Patent Screw Adjustment,
For opening, closing & fastening Windows.

A 553.

JAMES CARTLAND & SON,

Cabinet, Builders' & Furnishing Brassfounders,

BIRMINGHAM.

TRADE MARK

The Extent, Variety, and Finish of Articles Manufactured at this Establishment cannot be excelled.

THE REGISTERED DESIGNS AND PATENTED ARTICLES ARE NUMEROUS AND VALUABLE.

All Goods for Export are CAREFULLY PACKED IN CARTOON BOXES, and distinctly labelled with Orange-coloured Labels, bearing the Trade Mark as at side.

TRADE MARK

The attention of Architects and Builders is specially drawn to the merits of PRESTON'S PATENT SCREW ADJUSTMENT for opening, closing, and fastening windows of Churches, Board Schools, Warehouses, and Manufactories, as its extreme simplicity cannot fail to commend it.

An endless Cord passing over a grooved Pulley, and worked by hand, causes the Box to travel on Screw, carrying the Sash with it to the required distance, and remaining securely locked at any angle. The action is perfectly easy and a child can adjust it.

DRAWINGS MAY BE HAD ON APPLICATION.

LONDON SHOW-ROOMS:—40 HOLBORN VIADUCT.

COLES, STEWART & CO.,

STOCK AND SHARE BROKERS.

Messrs. COLES, STEWART & CO. undertake every description of Stock Exchange business, and have special and early information on all leading Stocks; they are also continually advised by telegram from the chief Mining centres, both at home and abroad. For Investment Messrs. C., S. & Co. make only one charge of $\frac{1}{16}$ per cent. commission on all descriptions of Stocks, and open Speculative accounts with from 1 per cent. cover and upwards, without any further risk or liability to their clients whatever.

THUS, £5 commands £500 Stock; £10, £1,000 Stock; £50, £5,000 Stock;
And so on to any amount.

In the transaction of speculative business Messrs. C., S. & Co. make no charge for commission or brokerage whatever unless their client makes a profit, when they take 5 per cent. of the profit made as their remuneration.

All transactions advised by wire as soon as completed. Monthly Circulars and Mining Reports post-free on application.

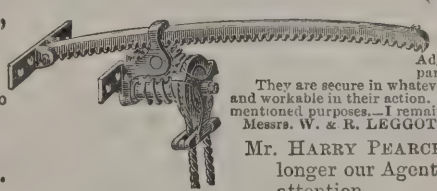
LEGGOTT'S PATENT ADJUSTMENT,

FOR FANLIGHTS, SKYLIGHTS, &c.,

Is admitted to be the best ever put before the Public.



From 5s. each.

Write for REDUCED PRICE LIST and Testimonials to

W. & R. LEGGOTT,

70 Park Road, Bradford, Yorkshire.

N.B.—Size and height of window no object.

TESTIMONIAL.

BANGOR, N. Wales: September 14, 1885.

Sirs,—I have pleasure in testifying that I have used Leggott's Silent Adjustments for various buildings to high skylights, fanlights, and top parts of windows, and in every case they gave satisfaction. They are secure in whatever position, whether the window is open or closed, and are quite simple and workable in their action. I prefer them to any other that I have seen or used for the above-mentioned purposes.—I remain, yours obediently, R. DAVIES, Architect.

Messrs. W. & R. LEGGOTT, Bradford.

Mr. HARRY PEARCE, 125 Great Portland Street, London, W., is no longer our Agent. All direct communications shall have our prompt attention. W. & R. L.

LOFTS' PATENT STOVES

Will burn any kind of Coal or Rubbish, consume their own Smoke, and require only one-fifth the Fuel of any other Store.

After four years of tedious experiments I have been able to produce what has long been required, viz., Domestic Stoves which consume only one-fifth the quantity of Coal (*One Ton instead of Five*) required by any ordinary stove, at the same time giving as great an amount of heat and more thorough ventilation. I have great confidence in recommending these to the public. Since perfecting them I have tried them for six months in the worst of smoky chimneys, and they have not failed in any one case; have shown them at work to a large number of scientific, medical, and practical men, and they have given but one opinion, which is that, as regards heat, health, and comfort, they are perfection, and they have not seen or heard of anything to equal them. The fire-grate is perfectly open, like the register or slow-combustion stoves now in use; they are neat, strong, and easy to understand; will burn any kind of coal or rubbish; consume their own smoke; are lighted just in the same way as an ordinary stove, and draw up as quickly and as easily.

Full particulars on application.

To be seen in action at London Show-rooms, 165 Queen Victoria St., E.C., or at Cambridge.

IMPORTANT.—To Specialists, Manufacturers, and Others.
Effective Advertising at a Minimum Cost. Now in preparation for Publication in January. Demy 4to, Illustrated.
THE ARCHITECT AND CONTRACTOR'S COMPENDIUM
And Specialist's Directory for 1887.
EDITED BY JOHN E. SEARS, A.R.I.B.A., F.A.S.
An illustrated and priced catalogue and directory of specialities, manufactures, and requirements in every branch of the Building Trade, and in office and workshop, carefully classified and indexed, combined with an Office Diary, Legal and General Information, Copies of Building Acts and By-Laws, Tables, and Memoranda. Illustrations may be inserted produced by the Litho- or Ink-Photo process. In addition to the usual circulation of a first-class Annual, the Publishers guarantee to send a copy gratuitously to every Architect and Builder whose name appears in the London Directory. Advertisements will thus for twelve months be in a convenient and attractive form before the eyes of the people Advertisers specially desire to reach, and this at a cost less than half that of sending out one circular.
The minimum guaranteed circulation of the Compendium is 3,000 copies, but the actual circulation will probably reach a much higher figure.
Special attention is directed to the fact that, at great expense, the Publishers have arranged to illustrate this work by the magnificent Ink-Photo process, specimens of which are to be seen weekly in *The Architect*. The Compendium will thus be far ahead as an artistic production of any class Annual published, adding greatly to its value as an advertising medium. The Ink-Photos can be produced, without block, from any drawing or photograph, and printed in any tint. The charges are very moderate, and will be quoted on application.
An exceptional opportunity is thus afforded Country and Colonial Firms to introduce their manufactures to the London market. The Compendium will be produced in first-class style, and will doubtless become a standard work of the trade.
Prospectus, with full table of contents, &c., free on application; but Advertisements and Blocks should be forwarded at once to the Advertisement Manager 16 New Bridge Street, London, E.C.

London: JAMES SEARS & SONS, Printers and Publishers, Crane Court, Fleet Street.

KIRKHAM & Co., Runcorn (*accepted*). . . £108 8 6

TRADE NOTES.

THE Secretary of State for Foreign Affairs has received a despatch from Her Majesty's Minister at Lisbon stating that on the 22nd inst. public tenders will be invited for the construction of the works necessary for improving the port of Lisbon, recently approved by the Committee of Public Works.

MR. EDGAR GAULD, of Aberdeen, has obtained the contract for the new reservoirs at Mannsfield and Slopefield, which will cost over 11,000*l.*

THE Municipal Council of Paris has granted to the Committee of the Jubilee of Railways the free use of 900 acres of the most attractive portion of the Bois de Vincennes, including the lakes, and the works will be commenced immediately.

MESSRS. STREET & Co., of Cornhill, state, in reply to numerous inquiries, that the new edition of their "Indian and Colonial Directory" will be issued early next month.

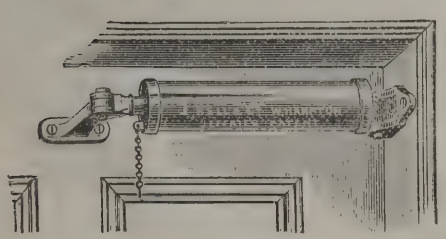
MESSRS. GIBBS, BRIGHT & Co, of Melbourne, have obtained a contract for 50,450 tons of steel rails and fish-plates, required for Australian railways; but this country will not gain anything by the work, as it is to be carried out in the Krupp factory at Essen.

THE St. Pancras Ironwork Company fitted up the extensive stabling that is required for the French Circus known as "Olympia," which is about to be opened at the new Agricultural Hall, Kensington. The stables have many points of interest, and are worth the attention of all who can obtain orders to visit them.

THE Builders' Benevolent Institution announce their thirty-ninth annual ball on Thursday, January 20, 1887, at Willis's Rooms, King Street, St. James's. Tickets can be obtained from members of the committee or the stewards up to Monday, January 17—double, 21*s.*; lady's, 8*s.*; gentleman's, 14*s.*, including refreshment and supper. We trust that this deserving charity will realise a substantial sum as profit on the ball.

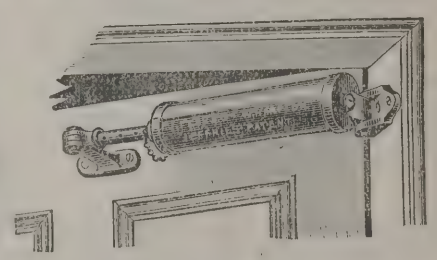
NOTES ON NOVELTIES.

Leggott's Patent Gum Damper.—Messrs. W. & R. Leggott, of 70 Park Road, Bradford, have just patented a very valuable invention for closing envelopes and affixing stamps and gummed labels. We have had it tried by our clerks, and have come to the conclusion that no office should be without one. A great saving in time is accomplished, and the offensive act of moistening the stamp or envelope with the tongue is avoided. As will be seen from our illustration, the damper



consists of a small brass case with a push at the end attached to a spring acting on an indiarubber disc. The tube is filled with water, and the pressure of the thumb and finger forces through a sufficient amount of moisture to damp the porous cloth. A thousand envelopes may be closed before the tube requires refilling. The damper is sold at a price which brings it within the reach of all.

THE BEXHILL-ON-SEA SEWERAGE WORKS.



THE sewerage works for Bexhill-on-Sea have been completed at a cost of 5,581*l.* They were commenced in the early part of March last, the tender of Mr. James Hayward, of Eastbourne, being accepted at 5,477*l.*, the additional outlay being expended on extra work to the contract. The whole of the work has been completed in a satisfactory manner, and has been carried out from the designs and under the superintendence of Mr. H. Bertram Nichols, Assoc.M.Inst.C.E., of Grosvenor Chambers, Birmingham, the engineer to the Board. Mr. Nichols's scheme was selected out of several candidates for the appointment last year. The contract work has not exceeded the engineer's estimate, and has been completed within the specified time.

JEFFERIES' PATENT
AUTOMATIC DOOR-CHECK AND SPRING,
For Public Buildings, Hospitals, Banks, Schools, Hotels, Offices, Warehouses, Private Houses, &c.
No. 2529.

Engraving showing Door closed.

The advantages of Jefferies' Patent Door-Check and Spring are:—
It is AUTOMATIC and CERTAIN in its action.
SLAMMING of doors is ENTIRELY PREVENTED, whilst PERFECT CLOSING is insured.
Doors can be made to close QUICKLY or SLOWLY as required.
Doors can be KEPT OPEN, if required, AT ANY ANGLE.
It works parallel with the door, and takes up VERY LITTLE SPACE.
Having NO COMPLICATED LEVERS, it can be fixed in a few minutes by an UNSKILLED WORKMAN.
It is DIRECT ACTING, so that friction is reduced to a MINIMUM.
The SAME CHECK can be used for EITHER RIGHT or LEFT HAND doors.
Being fixed OUTSIDE the room, it is not an eye-sore.
After being fixed it requires NO ATTENTION except OCCASIONALLY OILING at the joints.
Each Check is sent out COMPLETE with oil and screws, and PACKED IN A CARDBOARD BOX, with instructions for fixing.
In ordering, please give full particulars of size of door.
SOLE MANUFACTURERS:—

Engraving showing Door partly open.

JOHN FELL & CO., Wolverhampton; 9 Fenchurch St., London; and 163 Westgate Road, Newcastle-on-Tyne.
Also Manufacturers of Bath and Lavatory Fittings, and all kinds of Sanitary Brass Work, Pumps, Steam Fittings, &c., &c.

NOW ON SALE. THE LAST FEW PORTFOLIOS.

Price Eight Guineas on Japanese Paper, and Ten Guineas on Parchment.

EIGHT ORIGINAL ETCHINGS
From Water-Colour Drawings,
By THE BARONESS NATHANIEL DE ROTHSCHILD.
ETCHED by MM. T. CHAUVEL (GOLD MEDALLIST AT THE SALON), LEON GAUCHEREL, & DANIEL MORDANT.

"A magnificent set of two Picturesque Views in Holland, two Neapolitan, one Sicilian, one Venetian, and two French Views, which appear in the finest style, and display the exquisite touch of a born artist."

GILBERT WOOD & CO., 175 STRAND, LONDON, W.C.

The scheme embraces Bexhill and the village of Sidley, the total length of sewers constructed in the present contract being nearly six miles, and has been carried out under the separate system, the bulk of the rainfall being allowed to pass away through the existing channels. The stoneware pipe sewers are of Doulton's London manufacture, with the exception of about three miles of 9 inches and 12 inches diameter, which are of Hassall's patent, this joint being adopted on the steep gradients, and where it was necessary to insure a safe and watertight joint. The largest pipe sewer is 18 inches in diameter, laid along the Sidley Valley, which junctions on to the 2 feet 6 inches by 1 foot 8 inches egg-shaped main outfall sewer, having an outlet into the main sewer, constructed by Lord De la Ware for the Bexhill Estate, passing along the Esplanade to outfall tanks, and from thence out to sea in cast-iron pipes.

The ventilation is effected by numerous openings in the roadway in connection with the manholes and ventilators, of which there are about 115, on the sewerage system. Manholes are constructed at every change of direction, and ventilators and lampholes are inserted at every change of vertical deviation. By this means the sewers are under perfect control, and can be inspected at any time without difficulty; and, being broken up into short lengths by this system, each section of the sewers ventilates itself. There is a slight drop allowed at the manholes, and flap-valves are inserted to prevent sewer gas from rising into the high portions of the district. Sliding disc flushing valves are also inserted, for damming back the sewage to allow an accumulative discharge through the sewers for the purpose of flushing. The whole of the sewerage system is laid out in straight lines from point to point, with even gradients, having junctions for house drainage where considered necessary. The high portions of the district are ventilated by cast-iron shafts, 6 inches in diameter, carried up above the houses, surmounted with Gibbs's weather-proof extractors. Automatic flushing tanks are placed at the dead ends of the sewers, fitted with Doulton's annular syphons, which are capable of discharging about 600 gallons at each flush.

An interesting feature in the scheme is the construction of a large flushing tank on the 18-inch main outfall sewer in connection with a small stream, having a capacity of 1,570 gallons, which can be discharged three times consecutively, a weir being constructed across the stream. The tank is fitted with sluice-valve, penstock, overflow, &c., and has a 9-inch outlet. This tank is capable of discharging its contents in the short space of a minute and a half.

The clerk of the works engaged by the Local Board has been Mr. Julian Downsborough, of Bexhill.

AN IRISH BUILDING CASE.

ON Saturday a decision was given in the Irish Exchequer Division in respect of one of the stages in the action between Alderman George Moyers, LL.D., late Lord Mayor of Dublin, and the Commissioners of Public Works. The defendants applied to set aside a writ issued by the plaintiff, on the ground that the matters in respect of which the action was brought—to recover 5,400*l.* for extra work, materials supplied, goods sold, &c.—formed the subject of a submission to arbitration. The plaintiff was the contractor for the new buildings belonging to the Royal University, Earlsfort Terrace. Under a deed of August 21, 1884, it was provided that all the works, with the exception of the campanile, should be finished by September 1, 1885, and the campanile itself by September 1, 1886. The contract deed contained a clause providing that in the event of the Commissioners requiring any deviation from or alteration in the original plans, or any substitution of other works, materials, &c., in lieu of those already agreed for, such alteration or deviation should be conducted as affecting only the specific object in view, and not as affecting in any way the contract made, except so far as it might increase or decrease the quality of the work. There was also an arbitration clause, and in case of any difficulty or difference arising between the plaintiff and the Commissioners the matter should be referred to such arbitrator as the Commissioners might approve, and his decision should be final and binding on the parties. According to the affidavit of Mr. Owen, architect to the Commissioners, certain deviations and alterations were made in the plans, and others substituted, but it was not true that the works were interrupted by the Commissioners. For sufficient reasons it was necessary to suspend the work in the great hall, and he alleged that the claim made by the plaintiff on account of this interruption, amounting to 1,112*l.*, was in excess of the value of the work postponed, and up to the present the contract works were not completed. The Commissioners selected the names of several arbitrators, and submitted them to the plaintiff, and on October 23 he agreed through his then solicitors, Messrs. D. & T. Fitzgerald, to the appointment of Mr. James Kempster, of Ballinasloe, who was

to make his award before December 31, and the matters referred to in the action were the same as those agreed upon to be referred to the arbitrator. It was not true that the testimony tendered on behalf of the plaintiff before the arbitrator was rejected. The Commissioners had in no way impeded the arbitrator, and five meetings had been held at which the plaintiff attended. He repudiated the arbitrator appointed, and in his affidavit he alleged that the extra work done did not fall within the meaning of the contract of 1884, and that Mr. Kempster, the arbitrator, had acted unfairly towards him, and had refused to hear several of his witnesses, and he had ascertained that Mr. Kempster was actually in the employment of the Board of Works as District Inspector of Ballinasloe Lunatic Asylum.

During the hearing of the statements, Baron Dowse said he did not see how he could interfere to dismiss the writ unless it was made perfectly clear that the matters in dispute were within the terms of the original contract: and on Saturday, after the arguments had concluded, the Court refused the motion, and with costs against the defendants.

MR. HERKOMER, A.R.A., ON APPRENTICESHIP.

PRIOR to delivering the prizes to the students of the science and art classes at Folkestone, Sir E. W. Watkin, M.P., read the following letter from Professor Herkomer:—

My father, of course, is a splendid sample of the past age that honoured apprenticeship. Let your hearers know what the dignity of apprenticeship means. My father was apprenticed at fourteen years of age—had to do all the hard work of boys of that time, clean his master's boots, &c.; and though he sat with the master's family (as all the other workmen did) at table, he never had quite enough to eat. He had to learn his trade as well as he could by watching and without real tuition. On Sundays the apprentices of all the trades were marshalled in procession, accompanied by gendarmes, to the three schools —Sunday-school, day-school, and drawing-school. During that time my father already showed great ability as a draughtsman. His master, Hampfstaenge (the father of the present well-known photographer in Munich) saw his talent, and wanted him to compete for the one silver medal given that year to the apprentices for drawing in Munich, but he was too poor to buy the material. So the master gave him the paper, Indian ink, and materials, and his drawings gained the silver medal. I have those drawings now. They are masterly in their beautiful precision and delicacy of touch. Prizes were awarded by the mayor of the town in the fine old town hall of Munich; there was a great crowd of people to see the apprentices get their prizes, and when my father received his medal from the hands of the mayor a blast of trumpets sounded to mark the event. It was the only time in his life, said my father, "that he did not feel his legs when he walked out." Those are great triumphs. He then worked his way up to be journeyman workman, and then travelled on foot with a knapsack on his back, to Amsterdam, Brussels, and Paris, learning all the different methods of work in each city and country, when he made his masterpiece, and was pronounced an extra good master of his craft. He then made another tour on foot, and when he returned went in for a thorough course of perspective and geometry, and also studied the Gothic style from its foundation. He then settled in his native place, starting with a commission to make a new altar for the church. But his mind was "ahead" of the times. He had his romantic notions, and wished to build his own house. He pulled down the house left to him by his father, which was in a bad state, and built a charming house, which still stands, and in which I was born. But though it was simple it was dignified. However, 1848 spoilt Germany. He felt it was too "tight," and in 1851 we three—my father and mother and I (two years old)—emigrated to America. There the climate after six years affected the health of my mother and myself, and we came to England. Now in England at that time there was no taste for workmanship. We struggled with poverty until I could earn some money. But here mark the difference. The noble man who had gone through the severe training never allowed poverty to take one dignified thought from him, or to make him feel that life had only misery for him. He gave up smoking and drinking alcoholic liquors, and even eating meat, so as to reduce expenses. My dear mother gave music lessons for middle-class people. We had to live on thirty shillings a week. With this the "master workman," my father, had few chances of showing his skill; but he did buy a little wood from time to time, and did beautiful carved work, without, however, being able to sell it. Still he was a master, and lived a dignified life that could only come to a man when trained as he was trained. He never would have had the self-control without that training. He was my one companion as a boy. I worked with him. He knew how to guide my enthusiasm, and with scarcely any means at hand I learned a craft; I learned to use my

hands, and every day of my life I do bless the difficulties that really threw me so much in his company. He was to me not only a father but an "ideal" man. All his emotions, all his principles I drank in, and now it is my privilege to be able to work out the dream of his life. All the work he has done for years will have a shrine, and so, too, the work of his two brothers—the carver and the weaver—in my great house. The blessings of temperance he has given me also. Can you imagine such a life without an apprenticeship? I cannot. It is the curse of the age that young people wish to jump into maturity at a bound, and that the desire is not to do but to "get done," to deal in the article, not to make it. Respectability has cursed this age in this country—a craftsman is not supposed to be a gentleman.

UNIVERSITY BUILDINGS, CAMBRIDGE.

THE Botanic Garden Syndicate of Cambridge University report that the hothouses are in such a state of decay as to be in immediate danger of destruction whenever there is a high wind. Sir J. D. Hooker, of Kew, has recently recognised the Botanic Gardens as "one of the best in Europe," and it would be, say the Syndicate, an almost irreparable disaster if the houses were to fall and destroy the labour of many years. The Syndicate, after considerable hesitation, have decided to give up the system of piecemeal repair which has been followed for the last thirty years, and, acting under the advice of Mr. Jard, clerk of the works at Kew, propose to rebuild the houses. To set up a new range on the existing foundations would cost about 4,000*l.*; but the present arrangement is not on a level with modern requirements, and the Syndicate contemplate an entirely new range. The cost is not likely to fall short of 6,000*l.*, but the Syndicate have probably adopted the wisest course in resolving to face the whole difficulty, and they therefore propose that they be authorised to obtain plans and estimates on the above basis.

The Syndicate for the protection of University buildings from fire have made the rather startling discovery that, except the Fitzwilliam Museum and the Cavendish Laboratory, no University building is protected by a lightning conductor. It might perhaps be argued that, as they are not of great height, and have done without such contrivances for many generations, they might be left to protect themselves a little longer; but the Syndicate seem to think otherwise, and have decided to recommend that lightning conductors, at the estimated cost of 540*l.*, be set up on all the important buildings. This, however, being a large sum to spend at once on the object, they propose to do the work gradually, and to begin with the University Library, which will cost about 150*l.*

THE CHANNEL TUNNEL.

THE shareholders of the Submarine Continental Railway Company held their ordinary general meeting on the 16th inst., at the offices of the South-Eastern terminus, London Bridge.

Sir Edward Watkin, Bart., M.P., presided, and, in moving the adoption of the report, said that the Board had carried out the proposals of the shareholders under which they agreed to absorb the property, effects, rights, and privileges of the Channel Tunnel Company on the terms which the proprietors had approved. He could not help saying that the progress of the Channel Company was a record of engineering mistakes. First of all it was proposed to construct the tunnel between Calais and St. Margaret's, but that having proved to be an egregious engineering mistake, they shifted their ground on this side to a place called Fair Hole. The Directors, however, instructed their engineer to make a boring at the place where it was proposed to bring the tunnel on this side of the Channel, and they found that they were draining the land springs on the Dover side of the Channel. They had, therefore, come back to this position. They had proved beyond the shadow of a doubt that the only way to make a tunnel between the coast of France and the coast of England was by finding the grey chalk, as they had done, and following it to the other side of the Channel. He was happy to tell them that the stratum through which they were going was grey chalk, and their tunnel of 2,200 odd yards was practically dry. There was another fact of equal importance, and that was that the chalk walls and roofs of the tunnel showed no signs of decay. On the contrary, the surface of the grey chalk grew harder as time went on. When it was an unproved condition of things that the tunnel could be bored between France and England a large number of persons were for it, but the moment they proved that it could be done easily and cheaply some persons began to see great international dangers. They received a letter yesterday from the Board of Trade asking to inspect the

Wholesale and Retail Depot :—London, 211 Regent Street, W.

The Celebrated "DUBOIS" Hydraulic Drawn Lead TRAPS and BENDS.

The above Shapes and Sizes always in Stock, and we are prepared to furnish SPECIAL SHAPES to order at short notice. These justly celebrated TRAPS are made from Pure Pig Lead by Hydraulic Machinery after the manner of Lead Pipe, and have peculiar advantages appreciated by every Plumber. They are greatly superior to either Cast or Hand-made Traps, as they have no SEAM, are of UNIFORM THICKNESS, PERFECTLY SMOOTH INSIDE AND OUTSIDE, and can be FLANGED, PLUGGED, and STRETCHED, without fear of SPLITTING. No possibility of Sandholes.

FOR PERFECTION OF MANUFACTURE THESE GOODS ARE PRE-EMINENT.

For Sale generally by the principal Lead Merchants and Wholesale Dealers in Plumbing and Sanitary Appliances throughout Great Britain and Ireland.

DUBOIS MANUFACTURING CO., LONDON AND NEW YORK.

London Office and Works:—15 BRITANNIA STREET, KING'S CROSS, W.C.

tunnel. The Board stated that they thought it essential that Lord Stanley of Preston should go and see the Channel works himself. They believed that because Mr. Chamberlain, the late President of the Board of Trade, did not see the tunnel with his own eyes, he had arrested its progress. After quoting from a letter of Lord Derby addressed to Lord Beaconsfield, in which the former stated that the Government ought to support the tunnel, Sir Edward concluded by stating that the time would come when prejudice would blow away like the fogs of morning, and when those who had promoted civilisation and peace would get their own reward, not only in the pecuniary way, but in the belief that in constructing the tunnel they had done their duty.

Mr. G. Cavendish-Bentinck, M.P., seconded the motion, which was carried.

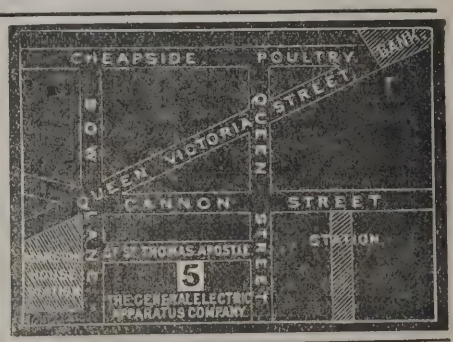
The meeting was subsequently declared special, when a resolution was agreed to approving the Bill empowering the Company to continue experimental works for a tunnel beneath the Straits of Dover, and for other purposes.

SMOKE ABATEMENT.

AT a meeting of the National Smoke Abatement Institution, held on the 13th inst., Mr. Ernest Hart in the chair, Professor Frankland, F.R.S., gave an interesting description of the smokeless fires which had been burnt in his house during the last five years, none of the chimneys having been swept during that time. The grates are the ordinary open ones that were in the house when he took it, no alteration having been made in them beyond a slight addition involving a cost of about two shillings. The fires are lighted with wood in the ordinary way without difficulty, and the servants appreciate them for their cleanliness. Professor Frankland, at the request of the Council, promised to give a lecture on the subject shortly.

It was reported that the Council had been in correspondence with the Home Secretary on the subject of the insufficiency of the fines inflicted in cases of smoke nuisance, and that subsequently at a meeting of the metropolitan magistrates, presided over by Sir James Ingham, it had been resolved to increase the fines in all cases.

A report on the work of the Institution was read, which described a considerable number of new smoke-prevention appliances which had been brought to the notice of the Council, especially some new smokeless stoves, which showed by the reports of the testing engineer, Mr. D. K. Clark, M.Inst.C.E., greatly-increased duty for the amount of fuel consumed.



It was resolved that the Home Secretary be requested to receive a deputation to lay before him the inefficiency of the existing Smoke Abatement Acts, which are now inadequate to deal with the existing metropolitan area, and the mal-administration of those Acts in the provinces; it was also resolved that the First Commissioner of Works be requested to receive a deputation on the subject with reference particularly to the deterioration of public buildings by smoky atmosphere, and the smokeless heating of public buildings; and also information upon the subject of modern heating methods, and the means of preventing smoke from furnaces and domestic fires which are available since the Institution took the subject in hand. Also that application be made to the Royal Society, the British Association, and the Society of Arts for grants towards the fund for further scientific testing of the merits of the two great classes of grates in use at the present time, viz., the so-called slow-combustion and quick-combustion grates.

BIRMINGHAM ENGINEERING STUDENTS.

THE Birmingham students of the Institution of Civil Engineers having recently formed themselves into an association, the inaugural dinner took place at the Colonnade Hotel on the 16th inst. Mr. E. Pritchard, M.Inst.C.E., president of the association, occupied the chair, and there was a large attendance of members and friends. The objects of the association are:—To offer to non-resident students some of the advantages enjoyed by London students; to promote and encourage the acquisition of knowledge by the members in all matters connected with the profession of a civil engineer, and to establish friendly intercourse among them; to arrange visits to works of interest in the neighbourhood of Birmingham; to hold meetings at which papers are proposed to be read and discussed; and in every way in their power to promote the welfare of the student class. It was announced that an attractive list of papers had been drawn up, the first meeting being fixed for January 27, when Mr. R. Peirce, Stud.Inst.C.E., will open the session with a paper on the Kidderminster sewerage and water supply. The hon. sec. of the association is Mr. Robert Green, Stud.Inst.C.E.

COUNTRY WATER SUPPLY.

AMONG the various arrangements that are used for the water-supply of country houses, villages, or small towns, one of the most economical in situations where moderate water-power can be obtained is that of a water-wheel driving pumps which draw their supply either from the same stream as works the wheel or from a separate spring or well. The details of such an

arrangement of machinery vary widely according to the power available, the quantity to be raised, and the height to which it has to be forced, and the like. We are enabled to illustrate two simple and very effective installations of this description, which have been designed and erected by Messrs. Hayward, Tyler & Co., hydraulic engineers, of Whitecross Street, London. The first illustration is of the pumping machinery used for the supply of a country house in Hertfordshire, where the water-power available is small. It will be seen to consist of an undershot water-wheel of large diameter in proportion to its water-power available is much greater than in the former case, and the quantity required to be pumped is much larger. The wheel is breast-shot, and the pump is driven by means of a powerful spur wheel on the main shaft of the wheel, geared to a pinion in the shaft, which gives motion to the pump. Clutch-gearing is provided so that the pump can be disconnected when needful. The pump is of the class used by Messrs. Hayward, Tyler & Co. in their long-stroke steam-pumps, and their "Diamond Field" mining pumps, and is suited for very heavy work and high lifts. The suction valves are accessible by

width, driving a double-acting horizontal pump (of the type so well known in connection with Hayward, Tyler & Co.'s "Universal Steam Pumps") by means of a connecting-rod attached to a disc on the wheel shaft outside one of the main bearings. The valves of the pump are all accessible by removing the air vessel without interfering with the suction and delivery pipes. Our second illustration shows a larger apparatus of the same type, constructed for Lord Spencer for the supply of the village of Chapel Brampton. In this case the means of doors, and the delivery valves by the removal of the air vessel. Both these arrangements have been fixed for a sufficient time to prove that the workmanship is thoroughly strong and durable, and that the design in each case is thoroughly adapted to the work that has to be performed. In cases where the water has to be raised from deeper wells, of course the arrangement is different. The pumps then are vertical, placed in the well and driven by suitable gearing from the water-wheel.

BRADSHAW'S LIMMER ASPHALTE

Messrs. BRADSHAW & CO., being Sole Agents in the United Kingdom for, and possessing proprietary rights in, the Freehold Mines of the German Asphalte Company (of which Mr. C. W. Bradshaw is also a Director), situated at Limmer, near Hanover, and Vorwohle, Brunswick, possess special facilities for reliable and prompt delivery of their celebrated "LIMMER ASPHALTE" at low rates, either for sale in its natural state or ready for laying by their own workmen in any part of the United Kingdom. EACH BLOCK supplied from these Mines, besides bearing the impress of the Company, is stamped with the words "BRADSHAW & CO." The attention of Architects, Engineers, &c., is particularly called to the fact that the "LIMMER ASPHALTE" is especially suitable for use in the construction of Reservoirs, Roofs, &c., where water-tightness is extremely essential. For such purposes **Over 2,000,000 (Two Millions) of Square Feet of "Limmer Asphalte"** have been executed by Messrs. BRADSHAW & CO.; while for Paving purposes **Over 50 Miles of "Limmer Asphalte" Footways** have been laid by them in the LONDON DISTRICT ALONE. Messrs. BRADSHAW & CO. will be happy to forward Prices, Samples, and Testimonials, and give all information on application to:—

R. ADAMS,

17 BLACKMAN STREET & 7 GREAT DOVER STREET, LONDON, S.E.,

INVENTOR and PATENTEE of the

SAFETY WINDOW WITH REVERSIBLE SASHES

FOR INEXPENSIVE AND PERPETUAL CLEANLINESS,

Which has gained at the INTERNATIONAL HEALTH and SANITARY EXHIBITIONS

Two Gold, Four Silver, and Four Bronze Medals, and Sixteen Diplomas of Merit.

IMPORTANT NOTICE.

The Patentee has been advised by several of his friends to form a Company for the Manufacture of the above-mentioned Sashes in larger numbers, for the supply of the Trade and for the Home, Colonial, and Foreign Markets. Hitherto he has only supplied the Fittings, except under very special circumstances. He now proposes to manufacture the Sashes complete with Fittings.

Provisional Protection has just been granted for another Patent, whereby the Sashes will be greatly reduced in price, and, consequently, brought within the requirements of every Architect and Builder.

If any of the readers of this journal wish to receive further particulars or to take Shares in the proposed Company, they are requested to make early application to the Patentee, as it is expected that the larger number of the Shares will be privately subscribed.

Applications for Shares will be taken in the order in which they are received.

BLACKBURN.

ASCHERBERG PIANOS,

Acknowledged by all MUSICAL AUTHORITIES and by all those who have had them in use for years to be

THE BEST

FOR TONE, TOUCH, GENERAL FINISH, AND GOOD VALUE.

Wholesale and Retail Depot :—London, 211 Regent Street, W.

The Celebrated "DUBOIS" Hydraulic Drawn Lead TRAPS and BENDS.

The above Shapes and Sizes always in Stock, and we are prepared to furnish SPECIAL SHAPES to order at short notice. These justly celebrated TRAPS are made from Pure Pig Lead by Hydraulic Machinery after the manner of Lead Pipe, and have peculiar advantages appreciated by every Plumber. They are greatly superior to either Cast or Hand-made Traps, as they have no SEAM, are of UNIFORM THICKNESS, PERFECTLY SMOOTH INSIDE AND OUTSIDE, and can be FLANGED, PLUGGED, and STRETCHED, without fear of SPLITTING. No possibility of Sandholes.

FOR PERFECTION OF MANUFACTURE THESE GOODS ARE PRE-EMINENT.

For Sale generally by the principal Lead Merchants and Wholesale Dealers in Plumbing and Sanitary Appliances throughout Great Britain and Ireland.

DUBOIS MANUFACTURING CO., LONDON AND NEW YORK.

H. T. TALLACK, 28 Hatton Garden, London, E.C.

QUESTION. WHOSE VENTILATORS are the best for Churches, Chapels, Schools, Billiard Rooms, Staircases, Kitchens, Stables, Factories, Hospitals, &c.?

ANSWER. HILL & HEY'S, The Patent Excelsior and Watson Syphon Ventilator Works, HALIFAX. Proved by the most extensive and varied application.

Established 1852.

WRIGHT & CO.'S PATENT FIREPROOF FIXING BLOCKS FOR WALLS AND FLOORS.

Awards 1886. "Certificate of Merit" from the Sanitary Institute of Great Britain at York. "Highly Commended" at the Firemen's Exhibition, Westminster Aquarium.

Improved fixing, sounder work, no extra cost. Extensively used for High Class Works by leading Architects, Engineers, Contractors, H.M. War Department, &c. Our new illustrated pamphlet, post free, containing full particulars, with numerous recent references, including opinions from Arthur W. Blomfield, Esq., M.A., F.R.I.B.A., J. Douglass Matthews, Esq., F.R.I.B.A., Colonel W. J. Stuart, Commanding R.E. Department, Chatham; Basil Champneys, Esq., B.A., R. J. Withers, Esq., and many other leading architects; also recommendations from practical clerks of works, well-known contractors, &c., who have always used our patent fixings with the greatest success.

WRIGHT & CO. 3 Westminster Chambers, Victoria Street, London, S.W.

Telegraphic Address: Fixing, London.
Works:—Gosport, Hants, and at Carnforth, Lancs.

BEST BLUE PENNANT STONE,

For all kinds of Architectural and Building purposes, viz.:—Ashlaring, Pillars, Columns, Archways, Steps, Sills, Landers, and Hearths; Paving for Church Floors, &c., &c.

Also for Monumental Work, viz.:—Tombs, Bases, Monuments, Headstones, Bordering, Crosses, Sawn Slabs and Block.

Local Board Work, viz.:—Kerbs (Flat or on Edge) Crossings, Paving, Channelling, Pitching, &c.

Wycombe Stone for Building, Pitching, Kerbing, &c.

We have lately supplied H.M. Board of Works with a large quantity for Casing the Curfew and, Chancellor of Garter Tower, Windsor Castle.

Samples of either Stone and full particulars on application.

THOMAS FREE & SONS,

Naphill, High Wycombe.

IRON GIRDERS, BRIDGES,

JOISTS, FLITCH-PLATES, ROOFS, BOILERS, COLUMNS, CASTINGS, &c.

S. WOODALL, 3 QUEEN VICTORIA ST., LONDON, E.C. Established upwards of a Century.

GRUNDY'S PATENT WARM-AIR VENTILATING FIRE GRATE.

The novelty, superiority, and advantage of this patent consist in the heating surface being greater than any other Fire-grate introduced to the public. It is very simple in construction, and is made in the form of a Stove, the back of which is semicircular in shape, with gills behind and smoke-nozzle on top, all cast in one piece. The same can be attached to any design of a Register or Stove front. It is very suitable for schools, class-rooms, waiting-rooms, hospitals, offices, dormitories, and dwelling-houses, from the cottage to the mansion. Design and specification post free on application.

TESTIMONIALS.

"9 Victoria Chambers, Westminster, S.W.: June 10, 1884.

"SIR,—I have much pleasure in testifying to the efficiency of your patent warm-air fire grate. It has been very successful, and given every satisfaction where I have used it. Yours, &c.,

"To Mr. Grundy. JAMES WEIR, F.R.I.B.A."

"6 John Street, Bedford Row, W.C.:
"December 16, 1885.

"DEAR SIR,—I have now had an opportunity of testing your patent grate, and am glad to be able to say that I am most agreeably disappointed, because, as you are aware, I was rather sceptical about its powers when you showed it to me; but now I can say it answers admirably, and heats abundantly my porch-conservatory.—I am, yours truly,

"R. S. LANDER, F.R.I.B.A.

"To Mr. John Grundy."

From James Garry, Esq., Architect, West Hartlepool, July 1884.

"DEAR SIR,—I have very great pleasure in stating that the first stove, or patent warm-air ventilating fire grate, adopted by me in school at Seaton, and a second in a Cocoa Palace, have given such satisfaction that I now order eleven to be inserted in New Upper Grade Schools in course of erection at West Hartlepool. They are the most economical, efficient, and easily managed stove at present before the public.—Mr. John Grundy."

From Hon. and Rev. G. G. C. Talbot, M.A., Withington, Cheltenham.

"DEAR SIR,—You will be gratified to hear that the school is completely warmed by your new grate. It is the most economical and efficient that I have ever seen.—Mr. John Grundy."

Society of Architects, Architectural and Building Trades Exhibition, 1885:—"5 Great James Street, Bedford Row, May 1.—The warm-air ventilating grate shown by Mr. John Grundy at Stand 75 Floral Hall, is an admirable contrivance for utilising the heat conducted through the back and sides of the stove, for warming schools and buildings by a supply of freshly warmed external air."

TRADE NOTES.

OUR Special Correspondent informs us that the slate trade price-lists for the new year are now fixed. The Carnarvon quarry-owners, at their meeting last week, decided to retain the present lists, reducing discounts as the season advances. There is an advance in some of the large sizes at Portmadoc, and all the quarries appear to have good orders for the coming year, and to be hopeful about trade; but there are still heavy stocks at the Penrhyn quarries.

THE Catholic Apostolic Church, Bridgnorth, has been further enriched by the addition of a reredos of Caen stone and alabaster. It is of the Decorated period of architecture, and consists of crocketted gables; in the centre is a carved and groined canopy, under which the tabernacle is fixed. The work has been executed by Messrs. Jones & Willis, of Birmingham and London.

THE parish church of Wishaw, near Birmingham, has just been renovated, the old seats removed and reseated in pitch pine, from the design of Mr. A. B. Phipson, architect, of Colmore Row, Birmingham.

A THREE-LIGHT stained-glass window has just been fixed at Hanney Church, near Wantage, Berks, in memory of the

late wife of the vicar, the Rev. James Macdougall. The style of the window is late sixteenth-century Italian, and it is a great ornament and addition to the church. In each light a figure is represented, viz., *Faith* on the left hand, *Charity* in the centre, and *Hope* in the right-hand light, and emblematic floral ornament in the canopy and at the foot of each figure. The window has been executed from designs by Mr. George M. Macdowell, under the direction of Mr. R. Owen Allsop, architect, of 37 Norfolk Street, Strand, London.

THE following contracts have been accepted for the Aberdeen Corporation Gasworks:—Cast and malleable iron, Messrs. Blaikie Bros., St. Clement Street; malleable iron and steel and ironmongery, Messrs. Glegg & Thomson, George Street; brass work, Messrs. John Blaikie & Son, Littlejohn Street; timber, Messrs. J. Rust & Son, York Street; painting and glazing, Messrs. J. & S. Fyfe, Dee Street; retorts, Messrs. J. Young & Son, Glasgow; silica bricks, Bonny Bridge Silica Co.

THE Leamington Town Council have accepted an offer from Mr. Arthur Chamberlain, of Birmingham, to light the town with incandescent electric light, at a cost of from 20 to 30 per cent. more than gas. It is proposed to lay in a temporary installation, to illuminate the Parade and the principal buildings with public electricity during the celebration of the Queen's jubilee.

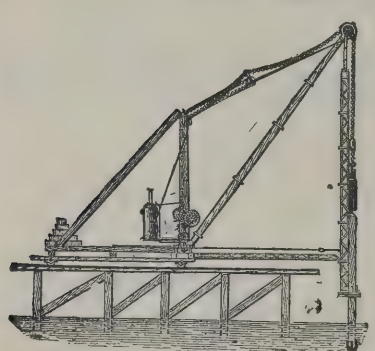
AT a meeting of the Elland Town Hall Committee, Mr. C. F. L. Horsfall, of Halifax, the architect, produced detailed plans of the intended structure, which were adopted. Mr. Horsfall is now preparing the specifications and bills of quantities for the works.

THE excavations at the Corinth Canal are stated to be progressing at a rate of about 18,000 feet a day, the number of workmen being at present 1,900.

MR. WALTER HALL, surveyor, land agent, and auctioneer, of 38 Chancery Lane, announces that he has taken into partnership Mr. M. W. Furneaux, who has for the past three years assisted him in his business, and who was formerly with Messrs. Dowsett & Woods. The title of the firm will be "Walter Hall," and business will be carried on at the above offices as heretofore.

THE Attorney-General (Sir Richard Webster, Q.C., M.P.) entertained the employés of Messrs. Kirk & Randall, and others connected with the building of his mansion, "Winterfold," at dinner at the Onslow Arms, Cranleigh, on Thursday last. The vice-chair was occupied by the architect, Mr. E. I'Anson, supported by Mr. Unwin, the clerk of works, and Mr. May, the foreman of works. After the cloth was removed, and the usual loyal toasts had been given, Sir Richard proposed in complimentary terms the health of the contractors, after which the host's health was proposed by Mr. May, and received with great enthusiasm.

AT the end of the year opportunity is taken to set one's house in order, and we again are glad to be able to recommend as aids to business the excellent diaries which Messrs. Hudson & Kearns have prepared specially for the use of architects and builders. They have little in common with so many flimsy brochures that are called diaries, and which are held together with difficulty before half the year has expired. Messrs. Hudson & Kearns' diaries are not only printed on good paper and well arranged, but the binding is strong enough to withstand a year's wear and tear, and to allow of preservation afterwards for reference. The blotting-pad produced by the firm combines so many conveniences that the name is insufficient to suggest its character, and it surpasses others of its class in utility and endurance.



HYDRAULIC MACHINERY.*

IN the old-fashioned and obsolete school-books on natural philosophy many interesting stories used to be related about the aversion of drops of water to being squeezed, and wonder was excited when it was said that if the pressure exceeded a fixed limit the water would escape even if it were enclosed in a golden globe. Then followed an account of the "hydrostatical paradox," through which any quantity of water, even the smallest, was made to balance and support the largest quantity. The description of the hydraulic bellows led to the hydraulic press invented by Bramah, which was the climax of water-power.

The extent of the force that was available through the resistance of water to pressure, and its want of elasticity, was not fully recognised until Sir William Armstrong took it into his head to find a relaxation from his lawyer's work in hydraulic

GILBERT WOOD & CO., 175 STRAND, LONDON, W.C.

experiments. Water-power was taken to mean such force as was applied in turning mill-wheels, 12 cubic feet of water falling a foot per second being taken as equal to a horse-power. Forty years ago, what were called "water-pressure engines," and which were largely used in Bavaria, were little known in England. Fairbairn and Darlington tried to apply them in mining, but it was found difficult to give an equable motion to the piston of the engine—the stroke became accelerated under the pressure of the water flowing into the cylinder, and the engine was only fitted for rough work, such as drainage. It was also found that the engine was rather complicated and liable to get out of repair. Anyone who is able to recall one of those old engines, which were suggestive of undergoing a strain, with a shock to finish every stroke, and thinks of it in comparison with such noiseless engines as are to be seen working every day in, let us say, Cardiff Docks, will acknowledge that the present period is in one respect at least far ahead of its predecessor. The coal-whipping machinery in the Welsh town is, in its way, as remarkable as the restored Castle. But that is only one of the ways in which water can be utilised as a motive power. It is now applied as aid in engineering construction, in pile-driving, excavating, drilling, &c. Hydraulic lifts have proved that stairs are no longer indispensable in buildings, and the gunnery of the future will, to a great extent, be dependent on the application of water-power in facilitating movements. In many ways it is a better servant than steam, and it has, moreover, the great advantage of being silent (it is water alone which can be termed a dumb-waiter), and, happily, it can never become a nuisance or create an evil like smoke. We need not be surprised when we find that from the time of Archimedes water has been made the subject of philosophical recreations.

Professor Robinson, in his new book on "Hydraulic Power and Hydraulic Machinery," begins with explaining the conclusions which have been formulated about the flow of water in pipes and conduits of various forms, a series of coefficients having been established for nearly every kind of orifice. There is, however, a want of uniformity in the notation which might have been avoided. Why, for example, should D in Eytelwein's formula express discharge in cubic feet, and in another place be displaced by Q—the diameter of the pipe being d in one place and D elsewhere? In Eytelwein, as commonly used, W stands for discharge, and is worth general acceptance as long as the result is taken in cubic feet, otherwise G for gallons is preferable. It is time there was a common adoption of lettering.

Davey's formula for the coefficient of friction in pipes is given. For wrought-iron or smoothly-coated cast-iron pipe the coefficient is—

$$C = \cdot 005\left(1 + \frac{1}{12d}\right);$$

and for a pipe that is old and slightly incrusted it is—

$$C = \cdot 01\left(1 + \frac{1}{12d}\right)$$

—that is, one is double the other. As bearing on this point, the remarkable observation of Mr. Bateman might have been given. He told a Parliamentary Committee that pipes when asphalted delivered, with a fall of $3\frac{1}{2}$ feet per mile, nearly a third more—*i.e.* 26 : 20—than was calculated for uncoated pipes with a fall of 5 feet.* Whether the difference was not in part owing to the inapplicability of the ordinary formulæ to pipes of large diameter is a question that has to be decided. Indeed, it cannot be said that our knowledge of the conditions of the flow of water in pipes is complete. It is shown, for example, in the book before us, on the authority of Professor O. Reynolds, that it is incorrect to suppose that water flows through a tube in a series of parallel lines as long as there is no impediment offered to the course. He was able to ascertain that, under certain conditions, a streak of coloured water will become diffused or break up into a number of curled forms resembling the letter S, phenomena which suggest new conditions of velocity.

The chief purpose of the book is, however, to explain hydraulic machinery. Everyone knows that a revolution was accomplished when Sir William Armstrong devised the accumulator, of which the use is described in the following words by Professor Robinson :—

> By means of an accumulator an artificial head can be maintained at any part of a hydraulic main. The abstraction of the high-pressure water to actuate hydraulic appliances is practically intermittent. The supply of high-pressure water from the pumping engine is continuous. It follows, therefore, that as the transmission of pressure through a water main is practically instantaneous, the intervals (however small) between the time of the production of the power and its utilisation in the appliance enable the pressure to be maintained and the excess to be stored in the accumulator. The variation in the consumption of the power, by reason of the fluctuation in the working of the machines, is at once adjusted by the accumulator, which both serves to store up the

LOFTS' PATENT STOVES

Will burn any kind of Coal or Rubbish, consume their own Smoke, and require only one-fifth the Fuel of any other Stove.

After four years of tedious experiments I have been able to produce what has long been required, viz., Domestic Stoves which consume only one-fifth the quantity of Coal (*One Ton instead of Five*) required by any ordinary stove, at the same time giving as great an amount of heat and more thorough ventilation. I have great confidence in recommending these to the public. Since perfecting them I have tried them for six months in the worst of smoky chimneys, and they have not failed in any one case; have shown them at work to a large number of scientific, medical, and practical men, and they have given but one opinion, which is that, as regards heat, health, and comfort they are perfection, and they have not seen or heard of anything to equal them. The fire-grate is perfectly open, like the register or slow-combustion stoves now in use; they are neat, strong, and easy to understand; will burn any kind of coal or rubbish; consume their own smoke; are lighted just in the same way as an ordinary stove, and draw up as quickly and as easily.

Full particulars on application.

To be seen in action at London Show-rooms, 165 Queen Victoria St., E.C., or at Cambridge.

excess of power delivered to the mains from the engines, and also to maintain the pressure in the mains. By this means power is transmitted without practical loss in hydraulic mains. It has been found that water at 700 lbs. pressure can be transmitted a mile with a friction loss of only about 2 per cent., where the mains are properly proportioned and where the head is maintained.

The original accumulator is still at work at Elswick. Many varieties have been introduced since by other inventors, which are described in Professor Robinson's book. The principle of the old Bramah press has been applied on a large scale in various structures. The machine for raising the tubes of the Conway Bridge is one example. Mr. Edwin Clark also designed several hydraulic lift graving docks. Some are equal to lifting a load of 14,000 tons. Barges carrying from 30 to 100 tons are transferred from the River Weaver to the Trent and Mersey Canal at Anderton, the difference in level being 50 feet. Eight barges up and eight down can be transferred in an hour. Similar work is done on a canal at Les Fontinettes, near St. Omer, at La Louvière, near Mons. The failure of one of the cylinders at Anderton caused anxiety about the safety of lifting machinery, and investigations were made by English foreign engineers, which have caused the Belgian Government to stipulate conditions about the dimensions of presses used for works of similar magnitude. The facilities offered by hydraulic presses as lifting forces led Sir John Fowler to work out a plan for conveying passengers from London to Paris without change of carriages. It was proposed to remove the engine at Dover, and to run the rest of the train on board a very large steamer by the aid of hydraulic lifts, which could be raised or lowered to suit the tides. At Calais or Boulogne the trains would run on to a lift from which it would pass to the railway. The lifts would be equal to 200 tons, and the time spent in raising or lowering would be about a minute. The lifts in connection with the Mersey Railway have strokes of 76 feet 7 inches and 87 feet 9 inches. The load is taken at 15,000 lbs., and each can carry 100 passengers.

Professor Robinson says that hydraulic power is finding a large field for useful employment in the direction of working house-lifts. He does not seem to care much for the adoption of counterbalancing cylinders. "There should," he says, "be no practical danger from the chain or rope (which should be connected to the sides of the cage, and not the centre), if care be taken that all the materials and connections are well tested, and are under similar conditions of strain." The "Otto Standard Hydraulic Elevator" of the American Elevator Company is selected for special notice. It has appliances to insure safety, which would come into play in any contingency.

The applications of water-power are so numerous that it would be vain to attempt their description in a single article. It is found that in treating large masses of iron a hydraulic squeezer has advantages over a steam hammer, since there is no shock, and therefore no danger of severing the fibres which are found in wrought iron. Hydraulic rivetters have been in use since 1851, and are a means of insuring good work, especially in shipbuilding. At Crewe they are found to surpass the steam rivetting machines. Professor Kennedy found that with $\frac{3}{8}$-inch plates "slipping" began in hand-rivetted joints when they were subjected to no more than 27 per cent. of the breaking strain, while machine-rivetted joints withstood the strain up to 59 per cent. Hydraulic machines can also be made available for shearing and punching, and whenever great power is required in a workshop. The assistance which can be given by them is suggested by the speech of Mr. Baker, one of the engineers of the Forth Bridge :—

More than 42,000 tons of steel plates and bars have to be bent, planed, drilled, and rivetted together before or after erection, and hydraulic appliances are used throughout. The plates are handled in the shops by numerous little hydraulic cranes of special design, without any complication of multiplying sheaves, the whole arm being raised with the load by a 4-inch direct-acting ram of 6-feet stroke. A total length of no less than 60 miles of steel plates, ranging in thickness from $1\frac{1}{4}$ inch to $\frac{3}{8}$ inch, have to be bent to radii of from 6 feet to 9 inches, which is done in heavy cast-iron dies squeezed together by four rams of 24 inches diameter and the same stroke. With the ordinary working pressure of 1,000 lbs. per square inch, the power of the press is thus about 1,750 tons. Some 3,000 pieces, shaped like the lid of a box, 15 inches by 12 inches wide, with a 3-inch deep rim all round, were required to be made of $\frac{1}{2}$-inch steel plate, and this was easily effected in two heats by a couple of strokes of a 14-inch ram.

The great girders of the Forth Bridge are put together at a low level, and raised to their position—that is, as high as the top of St. Paul's—by hydraulic power. It is also applied in connection with swing-bridges, dock-gates, and to cranes of all descriptions. But it may be anticipated that the applications of the power will be more various hereafter. In 1802, Bramah wrote to Robert Mallet—the father of the writer on engineering—saying he proposed to apply hydraulic power at a great distance from the centre. "I will engage," he said, "to erect

a steam-engine in any part of Dublin, and from it convey motion and power to all the cranes on the quays and elsewhere, by which goods of any weight may be raised at one-third of the usual cost. This I do by the simple communication of a pipe, just the same as I should do to supply each premises with water." The idea which is thus foreshadowed has been recently realised. About twenty years ago Professor Robinson proposed the establishment of a hydraulic power co-operative undertaking, which received the approval of Sir William Fairbairn. In Hull the system is at work, and in several of the London Docks. The Hull Company charge 52*l.* per annum for one crane in a warehouse, 94*l.* for two, 132*l.* for three, and 166*l.* for four cranes.

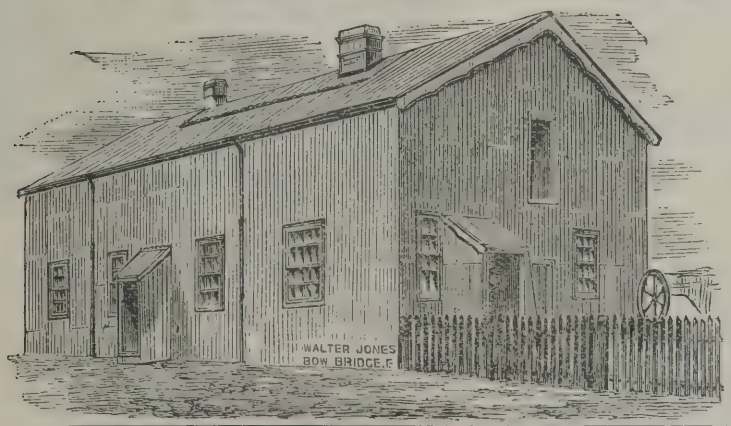
There is a temptation, when treating of hydraulics, to allow oneself to think in the first place of the formalising of equations. Many writers have found the pleasure irresistible. Professor Robinson considers the practical rather than the mathematical aspects of his subject, and by the co-operation of engineers, who have made a speciality of hydraulic appliances, he has produced a book which is a *résumé* of all that has been done in one of the most interesting branches of engineering, and of which, like electricity, the future appears to be unlimited in extent.

ROBERT BOYLE & SON, LIMITED.

THE first general annual meeting of this Company is fixed to be held on January 11, at Cannon Street Hotel, when it is proposed to declare a dividend at the rate of 12 per cent. per annum on the ordinary shares of the Company, a substantial proportion of the profits earned being carried to the credit of a general reserve account. We understand that the prospects of the Company are very bright, the business done during that portion of this the second year of the Company which has already gone, being considerably in excess of the business done during the same period of the first year. The ventilating contracts which are now in hand, and in prospective, are also very numerous and important. The Company have completed arrangements for the manufacture and sale of their various ventilating and sanitary appliances in Germany, France, Belgium, Holland, Spain, and Denmark, the business already done in connection therewith being very satisfactory, and it is anticipated that a considerable increase of "business" to the Company in the future will result from these sources.

THE AMERICAN EXHIBITION.

THE main building now being constructed on the grounds of the American Exhibition of the Arts, Inventions, Manufactures, Resources, and Products of the United States, at Earl's Court, Kensington, is entirely unique, and will in itself be a most interesting exhibit. The entire framework of the structure is composed of steel rails, such as are used in constructing railways. Two of these bolted back to back, with the T side out, make a very strong and really ornamental column. The only casting required is an angle iron and eyebar, into which the ends of the rails are slipped. This frame will then be covered with plates of glass and sheets of corrugated iron. The advantages are many. For rapidity of construction it is unequalled, as an acre a week can be easily put up, and it has also the advantage of economy, no skilled labour being required to put it up or take it down, and when finished with the material is as good and marketable as when first purchased. This invention, in fact, solves the problem of large temporary structures which can be quickly and cheaply built.



TESTIMONIAL TO A MANAGER.

MR. ALEXANDER RITCHIE, who for the past twenty-seven years has been associated with the Milton Ironworks, Glasgow, has been entertained at a dinner by the staff of the firm of Messrs. Steven Brothers & Co., of Upper Thames Street—the London house of the Milton Foundry, of which firm Mr. Ritchie has for the past seventeen years been the manager—and a company of private friends. The dinner was held at the Holborn Restaurant.

The primary cause of the gathering was to present Mr. Ritchie with an illuminated address from the staff, with a gilt inkstand and candelabra from the warehousemen of the firm, and a silver epergne from his private friends, and to congratulate him on his return to business after six months of enforced absence consequent on a serious carriage accident in April last, he having sustained a compound fracture of the leg and a painful illness following.

At the dinner referred to great sympathy was expressed by all present, and a very pleasant evening was spent, brightened as it was by a contribution of vocal and instrumental music

COLES, STEWART & CO.,
STOCK AND SHARE BROKERS.

Messrs. COLES, STEWART & CO. undertake every description of Stock Exchange business, and have special and early information on all leading Stocks; they are also continually advised by telegram from the chief Mining centres, both at home and abroad. For Investment Messrs. C., S. & Co. make only one charge of $\frac{1}{16}$ per cent. commission on all descriptions of Stocks, and open Speculative accounts with from 1 per cent. cover and upwards, without any further risk or liability to their clients whatever.

THUS, £5 commands £500 Stock; £10, £1,000 Stock; £50, £5,000 Stock;
And so on to any amount.

In the transaction of speculative business Messrs. C., S. & Co. make no charge for commission or brokerage whatever unless their client makes a profit, when they take 5 per cent. of the profit made as their remuneration.

All transactions advised by wire as soon as completed. Monthly Circulars and Mining Reports post-free on application.

COLES, STEWART & CO., St. Stephen's Chambers, LONDON, E.C.

from the members of the staff, the proceedings throughout being of a very hearty character.

The following address was presented on the occasion :—

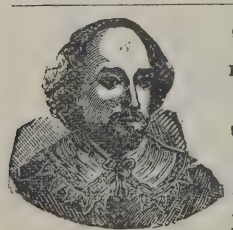
We, the staff employed by Messrs. Steven, Brothers & Co., London, desire to offer you our congratulations on the occasion of your return to business after so long an absence, necessitated by the serious accident which unfortunately befell you. We unanimously acknowledge the Divine Providence which has restored you to health, and enabled you to resume the responsible position you have so long occupied, and which you are so eminently qualified to maintain. We trust that you may long be spared to promote, with the same untiring energy and perseverance, the interests of the firm you have been so instrumental in raising to its present high position. Asking your acceptance of this expression of our sympathy and esteem, we are, dear sir, yours respectfully,

(Signed on behalf of the Staff) WILLIAM JOHNSTON.

December 18, 1886.

The epergne bore the following inscription :—

Presented to
ALEXANDER RITCHIE, ESQ.,
by the Undersigned,
On his recovery from a long and painful illness occasioned by an accident in April 1886, as an expression of their sympathy, and also of their pleasure at his restoration to health.
December 18, 1886.



BUILDING IN ABERDEEN.

THE building trade has been stationary rather than depressed, says the *Aberdeen Free Press*. The number of dwelling-houses erected during the year is quite up to the average, but there has been a decrease in the number of large public and private buildings. The works under the Extension and Improvements Bill have been the mainstay of the trade. They have not only afforded employment for a large number of workmen, but the demolition of so many dwelling-houses has given an impetus to building houses of the same class in other localities, and the vacant ground in the neighbourhood of the town is being rapidly taken up for that purpose. It is little more than a year ago since Summerfield Terrace was laid out, now it is all feued, and before the ensuing term there will, in that street alone, be accommodation for upwards of 150 tenants. In the same neighbourhood building operations have commenced in the new extension of Urquhart Road, sufficient at least to justify the action of the Incorporated Trades in completing that thoroughfare to the Links, instead of having the *cul de sac* originally contemplated. During the year a number of dwelling-houses have been erected in Torry, as well as in the north end of the town, and a good many villa and suburban residences have been added to the west end. Notable among these is a very interesting piece of architecture on the site lately occupied by Rubislaw House. In the south-west district building has been carried on vigorously, although it is probable that the speculative builders who have done so much in that neighbourhood will now be attracted to the very eligible feuing ground being laid out at Union Grove. Operations have at length been begun in the erection of the Public Baths, and during the year the Congregational Church in Skene Street West and the new church at the north end of Crimon Place have been completed. The new police stables on the Reclaimed Land have been completed, and amongst other large buildings in progress are the Public School at Rosemount, the Orphanage at Bayview, and extensive business premises near the south end of George Street. There is also the new convict prison at Peterhead, the contract for which was secured by an Aberdeen firm, which affords employment for a large number of skilled workmen. Of new buildings in prospect, there are two new churches in the vicinity of Union Grove, and the extension of the Royal Infirmary, which it is proposed to carry out in commemoration of the Queen's jubilee. As already indicated, no change has taken place in the cost of building. The low rates necessary to obtain contract work will not admit of further reduction. Perhaps no better illustration of the reduced cost of building within recent years could be cited than in the price of ordinary lath and plaster-work, the current rate being from 9*d.* to 10*d.* per square yard, whereas ten years ago 1*s.* 3*d.* per yard was readily obtained. During the same period there has been a considerable reduction in the price of lead and slates, and the cheaper kinds of foreign timber have also fallen in price. Looking to the year from the workmen's point of view, there is little to be said. For a short time during the summer months there was a scarcity of good building masons, but that has passed away. The standard rate of wages has been maintained, and the relationship between employers and workmen has continued to be of a cordial character.

CAST-IRON AND WROUGHT-IRON COLUMNS IN FIRES.

AMONG the "Abstracts of the Institution of Civil Engineers" is one by Herr Bauschinger on the behaviour of columns in fire, and under rapid cooling by water.

In 1884 new regulations were issued by the Berlin police authorities with regard to the use of cast-iron columns in new buildings, or alterations of old ones. According to these, "cast-iron columns which are not protected from the direct action of fire, may no longer be employed under the main walls of buildings of which the lower floors are used for business and storage purposes, and the upper floors as dwellings. In place of them will be allowed :—(*a*) Wrought-iron columns ; (*b*) cast-iron columns, which are surrounded by an irremovable casing of wrought iron, insulated by an air-space from the column ; (*c*) columns of stone set in cement."

The severe character of these regulations induced the author, at the instigation of Mr. Kusterman (the owner of a large foundry in Munich), to undertake a series of experiments in order to ascertain the behaviour of columns of various materials, but especially cast and wrought iron, under the action of fire and rapid cooling by water. The regulations in question were the outcome of observations made after a large fire at a manufactory in Berlin, on the condition of the cast-iron columns used in its construction.

The author's experiments were made on columns of cast iron, wrought iron, and building materials of various kinds. The column to be tested was subjected in the Werder testing machine to the compressive load it would have to sustain in actual use, and in this condition heated to the desired temperature, and then suddenly cooled by jets of water.

For the purpose of heating, the column tested was partially surrounded by a perforated wrought-iron trough, in which wood was burned. Owing to the nature of the arrangements, cooling could only be effected from the upper side, the position of the column being horizontal ; but this corresponds with what actually occurs at a fire in the majority of cases. An arrangement for measuring the deflections of the column during the experiments, in two directions at right angles to each other, was made by means of wires attached to the former, and acting on index fingers placed at convenient distance.

The temperature of the material tested was measured by means of alloys having various melting points, the highest being 600 degs. Centigrade.

Six cast-iron, three wrought-iron columns, and fifteen of various building materials were tested. The results showed that cast-iron columns best withstood the action of the fire and water, continuing to support their load even when red-hot and already cracked in places, whereas wrought-iron columns collapsed entirely under similar conditions.

The building materials tested were granite, marble, tufa, dolomitic limestone, concrete, paving stone, granitic marble, various kinds of sandstone, and ordinary bricks. Of all these materials the concrete proved to be the best, and after this ordinary brickwork. The concrete column tested remained uninjured after exposure to the treatment for one hour and three-quarters. None of the natural building stones resisted the fire ; granite was relatively the best, then tufa.

A NEW THAMES EMBANKMENT.

ARRANGEMENTS for the construction of a new embankment along the south side of the Thames, from the new dock of Putney Bridge to the parish boundary at Barnes, have now been completed by the Wandsworth District Board of Works, under the direction of their local surveyor, Mr. J. C. Radford, C.E. The embankment will be 45 feet wide, and consist of a 12-foot footway and a carriage-way of 33 feet. The foundation will be of concrete. The footway is to be fenced from the water by massive iron railings of a handsome design. The total cost is estimated to be close upon 5,000*l*. Towards this sum the Thames Conservators have promised 800*l*. The remainder of the required amount will be equally borne by the Metropolitan Board and the Wandsworth District Board. The work will probably be begun next month.

LIGHTING GLASGOW CATHEDRAL.

SOME time ago it was decided to supersede the paraffin lamps in lighting Glasgow Cathedral, and workmen have been engaged in the venerable building for the last three weeks constructing the necessary fittings for gas-lights. The work is so far advanced that early in the new year a special service will be held for the first time in gas-light. The fittings have been disposed throughout the building in such a way that the end in view will doubtless be attained. There are in all 400 burners. In the choir, where the congregation worship, there are four rows of

standards—twenty in all. Each standard has a cluster of from eight to twelve burners. In the lady chapel there are two standards, each having five clusters of thirty-two burners in all. The organ-loft, pulpit, entrance-doors, and other parts of the building are likewise well provided for in the arrangements, as is also the chapel-house, though in this last case it will be some little time yet before the work is completed. The whole of the work has been carried out under the superintendence of Mr. Fullerton, of the Corporation Gas Office.

*PROPORTION OF JOINTS AND CONNECTIONS IN FRAMED STRUCTURES.**

BY S. G. ARTINGSTALL, C.E.

THE details of construction in many cases are neglected and do not receive the care and attention which their importance demands. Many structures otherwise strong are extremely weak in detail, owing to faulty construction or careless design of the joints. The joints are generally the weakest parts of iron constructions. They should be proportioned so as to resist every direct and indirect stress which may come upon them under all probable circumstances, without subjecting the material to a greater strain than is legitimately allowed. The strength of a structure depends largely upon the proper proportion and distribution of material in the joints, and no amount of metal in the body of a member can compensate for a deficiency of strength in these parts.

Rivetted joints and connections are subject to injury by tearing the rivets through the plates when the bearing surface on the plate is too small, and by shearing the rivet when there is too low a rivet section. The first condition is very often neglected or entirely overlooked in many designs, although generally it will determine the size and number of rivets to be used, and often lead to an increase in the thickness of the plate. The pressure usually allowed upon rivet bearing is 15,000 pounds per square inch, and the bearing area is the thickness of the plate by the diameter of the rivet.

Shearing is produced by sets of opposing forces acting in the same or parallel planes, and for iron is usually taken as equal to its resistance to tension. In a well-proportioned tension-joint the collective shearing area of the rivet is nearly as effective as the area of the plate after deducting the rivet holes. But in rivetted work perfect accuracy is seldom obtained, and in consequence there is not perfect uniformity of strain among the rivets. In many cases the holes do not coincide, and the iron is distorted and injured by the improper use of drift-pins, instead of being reamed out and larger size rivets used. If the rivet is too short the workman will not scruple to use it. They are more easily put in when the rivets are heated only at the point; they do not require quite as much hammering as when heated throughout, but then they do not fill the holes, and may even be loose. Do not fancy they will be cut out on this account; the workman can make them appear tight when they are cold. Rivets heated in this manner will not remain tight if the structure is subject to much working. These little items, which go to make good work, can alone be detected by a competent working inspector on the ground. By these imperfections some of the rivets are scarcely strained at all, while others are overstrained. Even with the greatest care loose rivets are not uncommon, and perfect workmanship cannot be relied upon. On account of these defects the shearing value of rivets is usually taken at 7,500 lbs. per square inch when the value of the plate is 10,000 lbs.

The distribution of rivets in connections or splice plates, particularly in tension, require careful attention. They should be arranged symmetrically with reference to the axis of each bar, and the members weakened as little as possible by rivet-holes. A single hole accounts for the weakening, and the useful working action is equal to the section of the bar less the diameter of one rivet-hole. The strain in the bar is diminished by the amount transferred by the first rivet to the splice plate, and, although the section of the bar or plate is reduced by each succeeding row of rivets, the rivet strain is not increased. This condition holds good when the number of rivets in two adjacent rows does not increase by more than the number of rivets in the first row.

When the section of the member to be joined is not uniform, as in the case of an angle rivetted on one edge, the arrangement is modified so as to keep the centre of the line of rivets as nearly as possible equidistant from the centre of gravity of the section, otherwise the rivets will be strained unequally. The first rivet in this case is placed near the lower edge of the plate instead of near the centre, as in the first example.

The question as to whether the holes in connections must be punched or drilled ought to be determined by the design in

BEAN'S PATENT DIRECT-ACTING VALVELESS WASTE-PREVENTING CISTERNS.

These Waste-Preventers are simple in construction and rapid and powerful in action. The working parts have been improved and are well balanced. The arrangements for charging the siphon are such that a slight pull by hand is all that is necessary to cause the immediate and automatic discharge of the contents of the Cistern.

THE CHIEF ADVANTAGES are—(1) the direct-acting method of charging the siphon, by which the full flush is obtained at once; (2) simplicity of construction; (3) no valve in the bottom of the cistern to cause leakage; (4) no tight-fitting parts to corrode or get out of order; (5) no waste incurred by fastening the "pull"; (6) insures a rapid and regulated flush without holding down the pull.

JOHN BLAKE'S

PATENT SELF-ACTING

HYDRAULIC RAMS.

This Ram will force up 200,000 Gallons per day to Medium Heights.

TESTIMONIALS.—VILLAGE WATER SUPPLY.

From J. B. McCALLUM, Esq., C.E., Borough and Water Engineer, Blackburn, November 1, 1886.
Guide (Borough of Blackburn) Water Supply.

DEAR SIR,—Following is the short report I promised to send as to the work performed by the Hydraulic Rams—supplied by you to the Blackburn Corporation—after they had been in operation sufficient time to take proper observations.

The district of Guide—population about 500—in the Borough of Blackburn, is situated above the highest reservoir of the Blackburn Waterworks, and had no regular water supply until last July, when the Water Committee caused two of your Patent Hydraulic Rams to be put down and worked by water from a reservoir having a varying but maximum head of 34 feet 3 inches on the rams—the waste (clean) water gravitating to a lower adjacent reservoir.

You contracted to supply rams which would force 8,000 gallons per day each through 1,295 yards of delivery pipe to a service tank 170 feet above the rams, and I am bound to state that the result has considerably exceeded my expectations, as the rams are capable of pumping and have pumped much more water than you promised. The percentage of efficiency exceeds all I expected, and is, in my opinion, much more than is usually obtained from hydraulic rams.

From a test I made on September 29, I found that two rams with ¼-inch and ⅜-inch strokes respectively, supplied with 194,030 gallons per day together pumped 26,090 gallons per day to a height of 170 feet, giving 71·43 per cent. of efficiency, and one ram working at ⅜-inch stroke and with only 16 feet of working fall supplied with 154,587 gallons per day, pumped 10,587 gallons per day to the same height, showing 72·75 per cent. of efficiency.

At a subsequent test on October 11, one ram at ⅜-inch stroke and having 31 feet 9 inches of working fall supplied with 121,083 gallons per day, pumped 17,583 gallons per day to an elevation of 171½ feet, the efficiency in this case being 79·57 per cent.

In arriving at these results the greatest care was taken to positively measure the water, besides having a meter check on feed and delivery pipes.

The work carried out by you at Blackburn is substantial and satisfactory in every way, and if any engineer wishes to make his own observations he is at liberty to come here and do so.

From WM. DICKINSON, Esq., Agent to the Most Honourable the Marquis of Abergavenny, K.G., Eridge Estate Office, Hargate Lodge, Tunbridge Wells, July 3, 1885.

SIR,—I am instructed by the Marquis of Abergavenny to say that the Patent Hydraulic Ram, with over two miles of pipes, forcing water to a height of 230 feet, which you erected at Eridge Castle about nine months ago, has given his lordship entire satisfaction, and he has every confidence in its continuing to do so.—I am, Sir, yours faithfully,
WILLIAM DICKINSON.

From Mr. J. A. RUTHERFORD, Agent to C. F. H. Bolckow, Estate Office, Marton Hall, Middlesborough, September 26, 1883.

DEAR SIR,—I am glad to say that the Rams you put down on the Hambleton Estate for Mr. C. F. H. Bolckow are working very well. You undertook, with 16 gallons per minute, to send up 1,500 gallons a day, and with enough water to work the Rams at full power, 2,000 gallons a day. With a supply of 11⅜ gallons per minute they are lifting 2,200 gallons, and, when working full power, 3,105 gallons per day are sent up to a height of nearly 400 feet. They made a clear start, and have gone well since.

The Delivery Pipe, in the above case, is 9,000 feet in length.

From Mr. HENRY ROBINSON, Engineer to the Stockport District Waterworks Company, Sept. 8, 1883.

DEAR SIR,—I can now report well of the two Hydraulic Rams we have fixed to your instructions for the supply of Disley Village. 40,000 gallons per day was the quantity you promised they would force to a height of 68 feet, but on testing them I am convinced that 50,000 gallons is not the limit of their power, whilst the quantity of waste water used in driving them is not equal to half the capacity of the 6-inch pipe by which they are fed, and I am inclined to the belief that a more simple and efficient pump cannot be found.

From HORATIO R. B. PEILE, Esq., Commissioner to Sir Michael Shaw-Stewart, Bart., Mansion House, Greenock, Aug. 13, 1883.

I am glad to say the Ram you fixed at Castle Farm in November last for Sir Michael Robert Shaw-Stewart, Bart., continues a great success. The smallness of the driving water—2½ gallons per minute—is not more wonderful than the large proportion of water it sends up, viz., 720 gallons per day, through about 400 yards of delivery pipe, to an elevation of 75 feet.

From Capt. TOWNSHEND, Wincham, Feb. 10, 1877.

In answer to your inquiry, I am glad to say the Hydraulic Ram you sent me in November 1875 is working exceedingly well, and gives no trouble. It will work when quite immersed, as it has been several times during the floods this winter, forcing up water through a delivery pipe 900 yards long at the rate of 80,000 gallons per day, although you only promised 50,000.

From J. SPENDER CLAY, Esq., Ford Manor, Lingfield, Surrey, Aug. 9, 1880.

In reply to your letter of inquiry, I am glad to be able to say that the two Hydraulic Rams which you fixed here are working satisfactorily, and that out of 13 gallons 3 quarts per minute, the maximum yield of the spring, they deliver to the top of my house, distant a full mile from the spring, 4 gallons 1 quart per minute, or 6,120 gallons per 24 hours, being 120 gallons above the quantity you guaranteed.

From Mr. JOHN ARCHBOLD, Engineer to Messrs. Barber, Walker & Co., Eastwood, Notts, Oct. 21, 1882.

I am glad to inform you that the Hydraulic Ram you fixed for Thomas Barber, Esq., whilst working with a fall of 30 feet, and forcing to a height of 90 feet, through 200 yards of delivery pipe, is working exceedingly well, throwing up 9 pints out of every 35 pints passing through it, thus giving 77 per cent of useful effect.

From Mr. T. BARHAM FOSTER, C.E., 23 John Dalton Street, Manchester, October 12, 1883.

DEAR SIR,—I have tested the Ram you contracted to fix on the Hints Estate, Staffordshire, for James Chadwick, Esq., to force 10,000 gallons per day of spring water through 800 yards of delivery pipe to an elevation of 208 ft., whilst worked by river water falling 5 ft. 9 in., and am pleased to find that when at full power the ram sends up 13,500 gallons per day to the height and distance named, and though the Ram is now adjusted to work at only three-fourths its power, the work done represents over 57 per cent. of useful effect.

From FRED. J. TURNER, Esq., Agent to His Grace the Duke of Portland, K.G., Mansfield Woodhouse, August 30, 1883.

DEAR SIR,—I have much pleasure in stating that the Hydraulic Rams which you erected last year for His Grace the Duke of Portland, at Lyndhurst, near Mansfield, and at Skeldon, Ayrshire, are working very well, and they are most satisfactory in every way.

JOHN BLAKE, ENGINEER, ACCRINGTON, Lancashire, England.

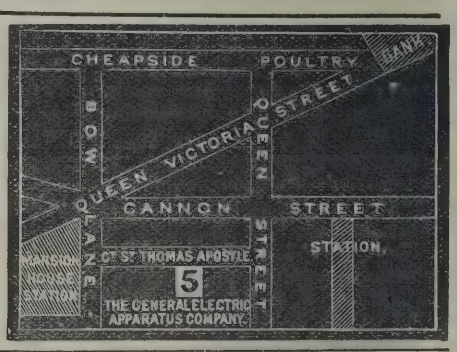
each case. If the holes are located near the edge of a plate or the quality of the iron is poor, it is liable to be seriously injured by the operation of punching, but it can be drilled without injury when a number of plates are to be rivetted together or a difficult connection to be made; it is better to use drilled holes unless unusual care is exercised at the punching-machine. Drilled holes should be slightly countersunk to remove the burrs which will cut into and injure the rivets.

For connections and splices, both in tension and compression, it is advisable, whenever practicable, to use double-splice plates. When a single-splice plate is used in tension, a couple will tend to bend it and spring the rivet heads, and single plates in pieces, under compression, are liable to crippling at the joints.

As the splice plates must receive and transmit the full strain of the member joined, its useful section must be equal to it; generally double plates require to be bent half the thickness, and require but half the number of rivets as they are in double shear. The length of the splice plates also diminishes with the number of rivets, so that double plates are economical. The strain from the members is more uniformly distributed amongst the rivets the less the number in the direction of the strain, since the stress of an abutting piece is transferred to the splice plate by the rivets, and the rivets on each side of the joint have to bear the same shearing strain upon the plate. The loss from rivet-holes in the splice plate is equal to the number of rivets in the row adjacent to the joint. The section of the splice plate is reduced by the diameter of three rivet-holes, while the effective section of the bar is reduced by the diameter of one hole only; hence the necessity of making the gross section of the splice plates somewhat greater than the sectional area of the member. Stoney recommends that single plates be made $1\frac{1}{8}$th times the thickness of the bar, and double splices. each $\frac{5}{8}$ths the thickness of the bar.

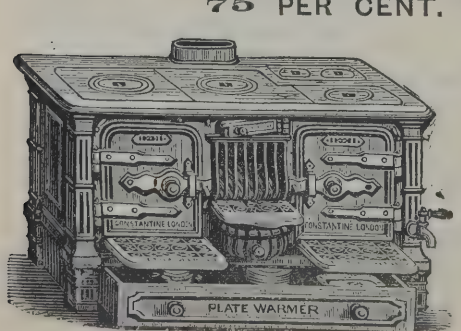
For compression members the disposition of rivets in connection may vary somewhat from the rules given for tension joints, it being assumed that the strain is transmitted direct, and that no loss is occasioned by rivet-hole. When the workmanship is perfect, if the abutting joints are placed or dressed so as to afford a perfect contact throughout, a simple plate with sufficient rivets to keep the members in position would be sufficient; but perfect workmanship cannot always be relied upon, and a close contact throughout the whole width of a plate is rare; the process of rivetting tends to draw the plate slightly apart, and a small interval is theoretically as bad as a large one; so that it is often better to assume that the strain must be transmitted through the rivets and splice plates, using the same rules for bearing and shearing as in tension; but greater latitude may be allowed in the distribution of the rivets, and neglect the loss occasioned by rivet-holes.

Pin Connections.



The efficiency of the rivetted joints of tension members will vary according to the design, but it can rarely exceed 80 per cent. of the strength of the solid plate, and hence it happens that the section of these members is increased, in consequence of the loss from rivet-holes, by not less than 20 per cent., to the theoretical weight of a tension member; that is, its section calculated on the imaginary hypothesis that it is made of solid iron, without joints or perforations. The size and length of the splices or covers is considerable, and their weight an important addition—in many cases over 12 per cent. added to the theoretic section. With pin connections these members can be proportioned very closely to the section theory demands; in many cases fewer parts may be used, for a certain amount of material put in one member will do more work than if distributed over two or more.

The use of rivetted joints and connections tends to diffusion of strains with many parts and connections, while with pin connections it is the reverse of this, the strains being concentrated in fewer and heavier members, with wider panels and fewer connections, and better facilities of obtaining the effective use of the entire section of the material. With pins, which transfer the strains through the centre of their diameter, the centre of pressure can be made to pass through the centre of gravity of the sections.



Pin connections require more careful and accurate workmanship. The pins must be turned accurately to the proper diameter, and the pin holes in all members, both as to size and distance apart, must be mathematically correct. This requires special tools and appliances and careful workmanship, which, if not readily obtainable, will cost more than the saving in material over rivetted work.

Pins must be estimated for shearing, bending, and heavy pressures. The bearing pressure allowed is the same as for rivets, viz., 15,000 pounds per square inch. The bending pressure will require careful arrangement and design, so as to reduce the moment of forces to the lowest possible limit. It requires that the different members be so placed that no two adjacent members act in the same direction. The pin must not

OAK PANELLINGS.
A SPECIALITY.
MR. J. ICHENHAUSER, of 68 NEW BOND STREET,
Is prepared to give Designs and Estimates for OAK PANELLINGS and CEILINGS, for Sacred and Domestic Buildings. Largest holder in Europe of Queen Anne, Jacobean, Louis XIV., Louis XV., Louis XVI., English, Italian, German, and Flemish Renaissance Styles. Also Antique Carved Oak and Marqueterie Furniture. Architects and intending Builders would do well to send for Mr. Ichenhauser's Illustrated Magazine, *The Collector and Art Furnisher*, Free.

be too small, or there will result a heavy shearing action in the pin or a crushing of the metal in the hole, causing elongation for want of sufficient bearing surface. Increasing the thickness of the head of a bar is not advisable, as this will increase the distance between bearings, with a consequent increase of the bending moments on the pin. The practical results arrived at from many experiments show that, with a proper arrangement of the joint, the greatest efficiency is obtained when the diameter of the pin is equal to four-fifths the width of the bar, and the thickness of the bar one-fourth its width. As the strain in the head of a link is less direct than in the body of a bar, and there is a liability to imperfections in manufacture and welding, it is essential that the bar should yield in the body rather than the head. To accomplish this it is necessary to make the section of the metal in the eye opposite the centre of the pin hole, and perpendicular to the line of strain, not less than 1¼ to 1½ the section of the body of the bar.

It may seem superfluous to urge upon you the necessity of making all the parts of a joint or connection as suitable as possible; avoid all complicated or twisted pieces, particularly the bending or forging of shape iron, which is not only expensive, but cannot be done without injury to the material. When the joint has to be rivetted it is essential that it be designed so that the workman can get in his rivets while hot, and can deliver such effective blows of the hammer so as to upset or swell the whole length of the rivet, that it may fill every interstice and inequality of the hole. A rivet which has been heated only at the point and made tight in forming the rivet head is of very little service, which is fully shown when a rivet has to be removed for any purpose. If it has been done in an imperfect or careless manner it can be readily driven out when the head is cut; but when it has been heated fully as much at the head as the point, and driven by a skilful workman, so that the effect of the hammering is transmitted to the more distant and interior particles, it will in many cases be necessary to drill it out, so completely has it become a part of the iron into which it is forced.

For pin connections, the conditions of manufacture and the quality of material and workmanship are always of the strictest kind.

The arrangements and proportion of the different parts in the connections sometimes require a great amount of skill, and it is hardly saying too much to state that the value of a structure can be measured by the fitness and symmetry of its connections.

BUILDING TRADE IN GLASGOW.

ACCORDING to the review in the *Glasgow Herald*, no complaint issues from the building trades as to the amount of work offering during the year in Glasgow. There have been and still are many heavy undertakings on hand, and the workmen for the most part have been well employed. A great deal of house-building has been prosecuted in some of the suburban districts. Locally the prospect for 1887 is not, from a tradesman's point of view, all that could be wished, but outside the city there is a large amount of work projected, so that no fear is felt for the results of the coming year. If the municipal project for the building up the Saltmarket is proceeded with, a very good item will be added to the work in prospect. In the following table are given the figures relating to linings passed by the Dean of Guild Court in the year, with comparisons for 1885:—

Nature of Operations.	1885.		1886.	
	Linings.	Valuations.	Linings.	Valuations.
Dwelling-houses and shops	47	£154,710	45	£186,500

IMPORTANT.—To Specialists, Manufacturers, and Others.

Effective Advertising at a Minimum Cost. Now in preparation for Publication in January. Demy 4to, Illustrated.

THE ARCHITECT AND CONTRACTOR'S COMPENDIUM,

Specialist's Directory, and Diary for 1887.

EDITED BY JOHN E. SEARS, A.R.I.B.A., F.A.S.

An illustrated and priced catalogue and directory of specialities, manufactures, and requirements in every branch of the Building Trade, and in office and workshop, carefully classified and indexed, combined with a 104-paged Office Diary, Legal and General Information, Copies of Building Acts and By-Laws, Tables, and Memoranda. Illustrations may be inserted produced by the Litho- or Ink-Photo process. In addition to the usual circulation of a first-class Annual, **the Publishers guarantee to send a copy gratuitously to every Architect and Builder whose name appears in the London Directory.** Advertisements will thus for twelve months be in a convenient and attractive form before the eyes of the people Advertisers specially desire to reach, and this **at a cost less than half that of sending out one circular.**

The minimum **guaranteed circulation** of the **Compendium** is 3,000 copies, but the actual circulation will probably reach a much higher figure.

Special attention is directed to the fact that, at great expense, the Publishers have arranged to illustrate this work by a new and magnificent process. The **Compendium** will thus be far ahead as an artistic production of any class Annual published, adding greatly to its value as an advertising medium.

An exceptional opportunity is thus afforded Country and Colonial Firms to introduce their manufactures to the London market. The Compendium will be produced in first-class style, and will doubtless become a standard work of the trade.

Unsolicited professional opinion from H. H. COLLINS, Esq., F.R.I.B.A., District Surveyor for the Eastern Division of the City of London:—"I brought the matter before my co-directors, and they have instructed the Secretary to make arrangements for a sheet for an advertisement. I think it a very good idea: not only ought it to pay you, but it ought likewise to be of great use to every member of the profession, as also to Builders."

Prospectus, with full table of contents, &c., free on application; but Advertisements and Blocks should be forwarded at once to the **Advertisement Manager, 16 New Bridge Street, London, E.C.**

London: JAMES SEARS & SONS, Printers and Publishers, Crane Court, Fleet Street.

"THE PEDESTAL VASE,"
JENNINGS' IMPROVED W.C. APPARATUS

(Combination Urinal and Slop Sink).

Registered No. 16,300.

A PORCELAIN VASE set on a tiled or mosaic floor, within walls or a dado of glazed tiles. The usual wood framing, forming a storehouse for the retention and accumulation of *damp*, *dirt*, and *disease germs*, with the joints, crevices, and imperfections in work which the closet enclosure so often conceals, is entirely abolished. The seat is hinged, permitting free access for use as a *slop sink* or *urinal*, and for cleansing, so that the entire apparatus and space can be freely washed down. For this latter purpose the floor should be slightly sunk, and laid to fall to a grating, with waste carried through the external wall, and terminating in a copper flap valve to prevent draught.

☞ The suggestions as regards wall linings and floor, may, of course, be modified as best adapted to the building in which the closets are used; and in the consideration of such details, alternative schemes will readily present themselves.

At the recent **HEALTH EXHIBITION** (South Kensington, 1884) amongst a series of official tests, under the supervision of Baldwin Latham Esq., C.E., and the Jury No. 9, Class XXIII., and successfully withstood by this closet, the following may be cited in evidence of its efficient action. Being fixed in position shown in illustration, with **"JENNINGS' PATENT SINGLE FLUSH WASTE-PREVENTING SYPHON CISTERN"** 5 feet over, with 1½ inch down pipe, ten apples (averaging 1¼ inch diameter) and a flat sponge about 4½ inch diameter were thrown into the basin. The water, as well as the whole of the exposed or dry surface, was first blackened with plumber's "smudge," and the sides covered by four pieces of thin sanitary paper, which adhered closely to the soiled surface. The handle of the cistern was then pulled, and the two-gallon flush liberated. After seven seconds (the time occupied by the discharge), a receiver placed under the trap outlet was removed, containing in the blackened water **the ten apples, the sponge, and the four pieces of paper,** no traces of the soil remaining visible upon any part of the apparatus.

GOLD MEDAL AWARDED.

THESE CLOSETS are already in use in Hospitals, Banks, Hotels, Offices, Private Residences, &c., with most satisfactory results, and, fixed in the manner described, in appearance and action leave nothing to be desired. By the novel arrangement of the supply to Basin, as shown in the sectional sketch annexed, the whole surface is well flushed and cleansed, whilst the bottom of Basin and Trap are thoroughly scoured by a concentrated rush of water which insures the **instantaneous removal** of the contents, thus overcoming the inherent defects in the many imitations recently produced of **"JENNINGS' MONKEY-CLOSET"** (the **original form of wash-out watercloset**), which was invented and patented by G. J. in 1852.
